MILWAUKEE, WISCONSIN — August, 1923

Two Dollars a Year

If you want Maximum Production and Mechanical Dependability when you buy a Freezer—

Then INVEST in the Cherry 80-Quart

The circular outlet assures quick emptying of the freezer and is so designed as to maintain a uniform flow without its being necessary to change the position of the can either at the start or finish. The gate is a solid disc of which the handle is a part and fits snugly (it is leak-proof) against the ground surface of the port. The gate is held in place when shut by the beveled slot shown in the illustration. When open it is held by four spring brass Belleville washers, the same as are used in the recoil mechanism of the French 75 m. m. guns.

The men who are buying *Cherry 80-Quart Freezers*

are the men who have studied carefully these and the many other features found exclusively on this machine

The drum of the 80-quart freezer is firmly attached to the base at the head, as shown above, with a heavy foot cast as an integral part of the freezing tube flange. It rests on and is bolted to the base at the front. It cannot become loosened or get out of alignment in any way. The cap screws, holding it in position and alignment, do not carry any of the weight of the cylinder. The illustration also shows the style of hinged handles that hold the front cover in place and the heavy material used in making up the head castings of this freezer.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

SOME industries maintain great Foundations for the cultivation of their own and the public's understanding.

Others place at their fore men of national prominence, special interpreters of and to themselves and to the public.

Still others support great practical semi-public undertakings—therein expressing their own worth and nature.

Industries that have a *character* seek self expression.

OF the ice cream industry its *National Expositions* are the ever more articulate medium of *self expression*.

More than a trade show---more than an educational display ---they are, in connection with manufacturers' national conventions, the annual self-speaking, self-interpreting of an industry itself.

*In conjunction with 23rd annual convention,
National Association of Ice Cream Manufacturers*

BULLETIN OF EVENTS

World's Dairy Congress—Washington, D. C., Oct. 2-3; Philadelphia, Oct. 4; Syracuse, Oct. 5-10, 1923. H. E. Van Norman, President, 426 Star Bldg., Washington, D. C.

National Dairy Exposition—New York State Fair Grounds, Syracuse, N. Y., Oct. 5-13, 1923, W. E. Skinner, 910 So. Michigan Ave., Chicago, Secretary.

National Association of Ice Cream Manufacturers—Annual convention, Cleveland, Ohio, week of October 22, 1923. Secretary, N. Loewenstein, 155 N. Clark St., Chicago, Ill.

Association of Ice Cream Supply Men—Second Annual Exhibition, Public Hall, Cleveland, Ohio, October 22-27, 1923 (inclusive). Roberts Everett, Secretary, 1328 Broadway, New York.

Southern Association of Ice Cream Manufacturers—Eleventh Annual Convention, Little Rock, Ark., December 4, 5 and 6. Secretary, J. W. Clopton, Decatur, Ala.

Pacific Ice Cream Manufacturers' Association—Annual Convention, Vancouver, B. C., Dec. 3, 4 and 5. Secretary, Bert Walker, Tacoma, Wash.

Western Canada Ice Cream Manufacturers' Association—Annual convention, Moose Jaw, Sask., February 6, 7 and 8, 1924.

Saskatchewan Dairy Association—Annual convention, February 6, 7 and 8, 1924, Moose Jaw, Sask. Secretary, Percy E. Reed, Moose Jaw, Sask.

ALL over the country the stage is set for action. Ice cream manufacturers are following up their advantages with commendable zeal, so far as this observer can tell, and many seem to be riding themselves hard to keep up with that will o' the wisp of trade which we are pleased to call ready demand. Ready demand, like time and tide, waits for no man.

So it really is necessary to be up and doing, "with a heart for any fate, still achieving, still pursuing," etc. while Old Sol is literally burning business out of people.

But there are things we should not overlook—things we should never be too busy to neglect. The care of materials and equipment, and the sanitation of the plant. A thousand times better is it to miss a little business here and there than forever to kill a lot of business by impatiently rushing out goods not up to the highest standard.

Keep your plant clean. Many people are interested in your business now. You want them always to be favorably so, and many more too.

TO a certain extent there shall always be production problems in the ice cream industry. Certainly the man who has not convinced himself that purity is the only way, shall face his share. But it is felt sure that the man who keeps an "In God We Trust" slogan in his heart and an "Honesty is the Best Policy" sign over his door—this man is sure to evade as many business troubles as anybody.

The real problem today is—salesmanship. This is the selling age. In the experimental stage we found out that ice cream well made has a steady market. The situation now has resolved itself into a matter of developing that market. The ice cream manufacturer who is not moving in that direction is riding for a fall; he is losing step with the march of advancement.

THE temptation is ever strong with human beings to try the so-called "easy way" to profits. To many of us in the ice cream industry are easily led to believe that making money is simply a matter of keeping down the production cost.

It is not to be denied that the selling price has the most important relation to production price, but we must not lose sight of the matter of volume. Many of us are coming to understand that there is no such thing as a short cut to volume. Ice cream can be made to meet most any price the dealers could expect, but unless it meets the approval of the ultimate consumers, it will not yield satisfaction to anyone, not even the dealers.

Ice cream manufacturers who have been in the business a reasonable length of time should certainly understand that the "easy way" does not lie in the direction of cheap, inexpensive ingredients.

The only way to make quality ice cream is to use quality materials. The manufacturer who thinks he can shave down on his prices and keep the consumer from knowing that there is anything lacking in his

product is fooling himself more than anyone else. No doubt, the consumer **can** be fooled as to what ice cream contains, but he certainly cannot be fooled as to what he actually **likes** to eat.

The supplyman who has the best interests of the manufacturer at heart will not offer to sell inferior goods. Regardless of how cheap the price, ingredients of poor quality always prove to be the most expensive.

The cheap way is the costly way. No one really wants to do anything dishonest. No one really wants to "get away with murder," as some supplymen believe to be the case. It is only that the temptation for the "easy way" is strong.

We must pay the price. We don't get things for nothing in this world, except trouble, and some of us even borrow that.

"THERE are smiles that make you happy"—and there are many other kinds of smiles that make you feel anything but happy.

For instance, there is the smile of the chap who told you your business had outgrown present equipment, and you didn't believe him and later something happened. Conservatism is a good thing when wisely applied, but a common failing among business men is the habit of believing they can make things stretch—make this and that device do double duty in a pinch.

In business, as in war, we have to keep our positions fortified and well supplied with arms. In our case the arms are equipment. Keep up your equipment. Napoleon said he often won because he kept reserves. Keep prepared. Don't let a breakdown interrupt a winning sales march. We have to spend money to do business.

IF ALL the people about whom we have had bad opinions were one-half as bad as we sometimes represent to ourselves, what a terrible world this would be. Many ice cream manufacturers, by worrying over what their competitors were saying or doing, have lost more business than their competitors ever could have gained from them. The business lost was that business to be developed among the people who eat ice cream, who are much more important to the industry than retailers.

In the ice cream industry we are much like the characters in "The Shiek and the Plague," a play that had a very successful "run" last winter.

"I want ten thousand of your men," said the Plague, who represented disease of mind and body.

"No," said the Sheik.

"I must have them," said the Plague.

"Well, take them if you must," replied the Sheik, grudgingly.

Thirty thousand of the Sheik's men were taken.

"I thought you only wanted ten thousand?" cried the Sheik.

"That's all I took," said the Plague; "the other twenty thousand died of fear—not disease."

Some of us in the ice cream industry are so busy

fearing our competitors we don't find time to develop the business that is waiting for somebody—just waiting. Fear kills business as well as men.

MEN who buy advertising space will be interested in this: "We are going to hold our convention in December, and we are looking to you to help put it over big."

That is only one of many similar messages coming to us from far points, from the distant Southeast and the remote Northwest, from the Middle West and the extreme North, as convention dates are being fixed.

That brings up the question—What is a good advertising medium? One that has wide circulation to its credit has good claim to merit. But add to wide circulation the evidence of having earned the faith and trust of readers, and that pretty well establishes the argument of selling service beyond doubt.

"We are looking to you—" The beauty of it is they KNEW they could count upon us. Service is our merchandise.

WHEN the late Dr. Johnson compiled his truly remarkable dictionary a lady discovered an error—just one tiny error. Asked why he gave the wrong definition for the word "pastern," Dr. Johnson replied, "Ignorance, Madam,—just plain ignorance."

Even very learned people can be ignorant of some facts well known to people of less knowledge. Most any American school child, for instance, knows more about ice cream than does Dr. Julie Stevens, who says she knows what people ought to eat. She thinks Americans are very unwise in their eating. So do most Europeans, who are used to drinking wine, which kills the appetite for wholesome eating.

"Thousands of you go to your graves annually as the result of diabetis and cancer of the stomach, diseases which could easily be prevented if you weren't always munching chocolates and sipping ice cream sodas," she told a New York newspaper reporter.

Dr. Julie Stevens was dietetic adviser to the late Madame Sarah Bernhardt. She undoubtedly knows much about food—that is, food as known to the average Frenchman. It is only lately that her countrymen have begun turning from their wines, which cause hard arteries, to ice cream, which is very wholesome.

The United States army feeds chocolate to its soldiers, the finest soldiers in the world. This is mentioned just to show the ignorance of Dr. Stevens concerning one food product.

Now, let any member of the grammar school class in physiology rise and tell Dr. Stevens what she ought to know about ice cream—just one member. The youngest will do.

Somebody from abroad is always feeling sorry for unenlightened Americans. However, no one from "the other side" has ever been able to explain why American boys, who so dearly love their ice cream, invariably

triumph over Europeans when opposed in athletic contests.

IF YOU have ever read legends of Old Mexico, you probably recall Don Juan Emmanuel, who was "a rich and worthy man, Senor, with the bad habit of killing folks."

Don Juan Emmanuel didn't have a thing on some of our rich and worthy lawmakers, who don't hesitate to sink an assassin's knife deep into the vitals of business everytime they think it is good for a few extra votes.

Reflect upon how many Don Juan Emmmanuels you have in your legislature when you begin to make up your mind about attending your convention this year. Then decide if you would rather make your own dairy laws in your state, or leave it to men who are most worthy but terribly interested in votes, which do not necessarily help the cause of the ice cream industry, you know.

THE most of us can recall the special dishes that mother used to make. Many a poor wife has shed tears because she couldn't produce the same dish for friend husband.

The good lady who recently helped us celebrate a quarter century of fairly good teamwork never has been able to make noodle soup that tastes like mother used to make. Not long ago we put our feet under mother's table and the same old noodle soup was on the bill of fare, as per special request.

Then we learned why even good noodle soup doesn't taste like it did thirty or forty years ago. We haven't the same taste for noodle soup that we enjoyed as a farm boy. We haven't worked up sufficient nerve to apologize to friend wife for all the unkind things we have said about her noodle soup, but we feel that we should just the same.

What does this have to do with the ice cream business? Well, it has just this much to do with it; even poor ice cream tastes pretty good when folk's tasters are right. On a hot day or evening folks eat ice cream for its cooling, satisfying effect, not for its food value. They have been taught to associate "food value" with "fuel value," and the only fuel they are worrying about is next winter's supply.

Good ice cream is none the less appreciated during cool weather, however, and the memory of it will cause customers to seek it out when they are in a more critical mood. It's a mistake to think that a successful ice cream business can be built up on inferior quality just because it "gets by" during hot weather.

WHAT is the news over the country? The newspapers report that it is very hot in most sections. This pleases ice cream manufacturers. Supplymen report that the industry is active everywhere. That is generally understood.

The newspapers say that the strike in English paper mills will boost print paper prices over here. Let the

publishers drop their tears in silence, for that doesn't affect you. It is just one of our own little tragedies in several acts and many curtain-calls.

The same papers tell of elaborate summer parties with oodles of ice cream served. That turns out to be misleading news—at least, misleading to the manufacturers of ice cream. For when you drop in to see your dealer, you find him dashing among his pills and pins, scooping out a dish of ice cream now and then and learn that he hasn't even heard of any parties. If some matron were to tell him that she is about to entertain and were to seek his advice, he probably would be too busy with his catch-penny trade to hear her.

Yet, we all want to hear the news. In the end we shall understand that we, ourselves, have the news. Then we shall take it upon ourselves to tell our prospective customers something about commercial ice cream. Most of them haven't yet heard of it.

HAVE you a dealer that, to your certain knowledge, ever sold a dish of ice cream—**actually sold** it without having to be hemmed up and coaxed out of it?

What is selling? Selling is inducing a man to buy something that he never would have thought of if the desire to possess that merchandise had not been created. If you have such a dealer, don't trouble yourself about any additional accounts; just find out how your salesman is working his schemes and pass some of them along to your other agents. Dealers of this kind are worth more than gold—yea, much fine gold.

IT WON'T be long before time for ice cream manufacturers of the entire nation to pack their troubles in the old kit bag and do some traveling. The Dairy Show is the first stop, and the program promises to be more interesting to the ice cream man this year than ever before.

Then comes Cleveland and the National Ice Cream Exposition. The National Association of Ice Cream Manufacturers is sure to have a good program and The Association of Ice Cream Cream Men has hung out the "Bigger, Better, and Brighter" sign. Syracuse, and then Cleveland. Soon time to get set.

WHILE investigators and other busy folks are trying to find out why sugar is comparatively high in price, the user of sugar keeps right on paying the higher price. Just what caused the big jump in price is of little interest to the man who is paying the price so long as he has to keep right on paying it.

What he is more interested in is to learn whether there is relief in sight. Speaking frankly, we don't believe there is, and the ice cream manufacturer who adjusts his prices for his products in line with advanced costs, not only of sugar, but of other materials, is doing the wise and just thing.

ICE CREAM CANS

The "Electric Weld" is now the most popular can used by Ice Cream Men.

Ice Cream Men have been asked why.

Here is a composite answer.

They are:

Easy to Clean.

Easy to Retin.

Do Not Leak.

Are Stronger Than Ever.

Have no Solder or Rivets, and orders are filled promptly by the factory, warehouse, or Electric Weld Jobber.

CONSHOHOCKEN, PA.

Intelligent Standardization of Ice Cream Mixes

By BENJAMIN MASUROVSKY*

IN COMPOUNDING an ice cream mix due consideration should be given to the following essentials:

1. The quality of the ice cream constituents will directly affect the quality of the finished product. Hence, the butterfat and milk solids not fat (M. S. N. F.) should come from reliable sources. The same applies to the other constituents of an ice cream mix and, therefore, guaranteed purity and grade should serve as a guide in selecting them. It is highly important that the milk products, being the sole sources of the milk constituents of ice cream, should be handled in a sanitary way to insure an excellent product. The latter is substantiated by the fact that in judging creams and ice cream made of the scored creams at dairy exhibits it is found that the highest prized ice was made, invariably, of the high scoring cream and the poorest ice cream is a result of the poorest milk products which entered into the ice cream mix.

2. To insure a high grade product it is essential that the various ice cream ingredients enter in proper proportions:

(a) The requirement of butterfat in ice cream is usually fixed by the law of the state.

(b) Special attention should be given to the milk solids not fat (M. S. N. F.) for several reasons: 1. Without the presence of milk solids not fat the ice cream ceases to be a dairy product. 2. The milk proteins, milk, sugar and ash are the principal ingredients of the milk solids not fat. 3. The mesh work of the entire ice cream mix is due to the presence of the milk solids not fat in it. 4. Colloids, necessary for the formation of an ideal ice cream mix, are contributed largely by the milk solids not fat.

3. The addition of proper amounts of the desired sort of sweetening material to the ice cream mix is essential in good ice cream making, for the content of sugar is responsible not only for the sweetness of the ice cream but also for the hardness, flavor, body and other important characteristics of good ice cream.

4. It is essential to avoid the addition of water from sources other than milk products. It is known that milk contains a great deal of H₂O (designation for chemically pure water), for if we consider the percentage of total solids in skim milk to be 9 per cent then the water content runs as high as 91 per cent, which means that the consistency of an ice cream mix can be obtained by using more whole milk or skim milk. Abandon the practice of diluting ice cream mix with water as much as possible for the following main reasons:

(1) The water which is ordinarily used for bringing about the right consistency of the ice cream mix carries some mineral salts, organic matter and bacterial flora which, although present in small quantities, are not desirable in the ice cream mix.

(2) The mechanical action of the added water is comparatively slow for accomplishing the same work which is performed by the water already present in the milk as one of its chemico-physical constituents.

For emphasis let it be repeated that the proper consistency of ice cream mix can be accomplished satisfactorily without addition of water when "separator" skim milk is used not only as a source of milk solids not fat but also as a diluent.

To facilitate the actual compounding of the ice cream mix it is advisable to divide it into two distinct parts according to the nature of solids it contains: a. basal part which carries the solids derived from milk products; b. complimentary part containing solids derived from sources other than dairy products. The basal part of the ice cream mix contains the following solids: butterfat, milk protein bodies, lactose (milk sugar) and mineral salts. The complimentary part of the ice cream mix provides the following solids: Sugar, gelatine or vegetable gums, and commercial ice cream improvers.

Since the butterfat and milk solids not fat constitute more than half of the total solids usually found in an ice cream mix special attention should be given to their proportions. The butterfat of the milk products used in the mix can be established by the well known Babcock test or any other approved analytical method. The milk solids not fat of the same dairy products are either determined by evaporating the milk product so as to obtain percentage of the total milk solids and then subtracting the percentage of butterfat found and the content of milk solids not fat of a given sample becomes known; or with the aid of a lactometer and thermometer the specific gravity of the fluid dairy product is found. By making use of the Babcock formula, given below, the content of milk solids not fat of a given milk sample is obtained:

Babcock's Formula.

Solids not fat equal $\frac{1}{4}L$ plus 0.2 B. F.

(L is the reading of Quevenne lactometer; B. F. is the percentage of butterfat.)

In the case of thick creams the specific gravity can be calculated according to Richmond's Method: Mix the cream under consideration with an equal weight of skim milk and using Quevenne lactometer apply the following formula:

$$C = \frac{S \times M}{28 - M} \quad \text{Where } C \text{ is specific gravity of cream.} \\ S \text{ is specific gravity of skim milk.} \\ M \text{ is specific gravity of mixture.}$$

Illustration:

Find the specific gravity of a 35 per cent cream:
Given: 1. The specific gravity of the skim milk is 1.036.—2. When equal weights of the given skim milk and cream are mixed the specific gravity of the mixture is 1.029.

Solution:

$$\text{Sp gr. of the 35\% cream is } \frac{1.036 \times 1.029}{(2 \times 1.036) - 1.029} = 1.066.$$

Although the Babcock formula for the estimation of solids not fat has been worked out primarily for milks it can also be applied to creams, however, with less accuracy but close enough for all practical purposes.

The milk solids not fat present in "separator" skim milk is taken as 9 per cent. When used in the preparation of the ice cream mix the fat content of skim milk is negligent and is not taken into account.

If intelligent standardization of the ice cream mix is desired it will pay to analyze milk products which enter the mix, for milk solids not fat as well as for butterfat, because there is considerable variation of the milk ingredients within the normal milks and creams.

It is in the interest of the ice cream manufacturer who makes orders for milk, cream, condensed milk or

THE C-B-W CALENDAR

EQUIPMENT FOR HANDLING

MILK FROM COW TO CONSUMER

What House Can Surpass This?

The best month out of the twelve to lay plans for future improvements and changes is August, because the need for these changes is most apparent. Why not let us co-operate now? Let us check up the plant performance with you and help solve any problems brought to light. A letter from you to our Ice Cream Service Department will bring a representative who can help.

Where can you obtain a better or more complete line of equipment than the Bestov line? Compare it, machine for machine, with other lines.

The Bestov standards are exceptionally rigid, permitting nothing but the finest machinery the world produces to enter its ranks.

Proof of these claims is being established now as you read, in hundreds of plants where Bestov machinery is being put to the rush season test.

Call upon us in an emergency. We are anxious to serve you at a time when real service is appreciated.

Cherry-Bassett-Winner Company

NEW YORK CITY

other milk products, to specify the percentage of milk solids not fat and of butterfat desired in each milk product, respectively. This will enable the creamery or any other supply house to standardize their products accordingly. Knowing the exact content of milk solids not fat and butterfat in the milk products intended for use in the ice cream mix it is best to standardize, at first, the "basal" part of the ice cream mix.

Suppose it is required to prepare a mix of the following composition: 12 per cent butterfat, 13 per cent sugar, 35.5 per cent total solids, 10 per cent milk solids not fat, 0.5 per cent gelatine and 0.5 per cent vanilla extract.

Given: Cream testing 35 per cent B. F. and 5.8 per cent milk solids not fat; "Separator" skim milk testing 9 per cent milk solids not fat; Powdered skim milk testing 95 per cent milk solids not fat; Gelatine containing 100 per cent solids; vanilla extract for flavoring ice cream, pure cane sugar.

Solution: Step 1: Determine the amount of complementary parts for 100 pounds of batch.

Sugar	13.0 pounds
Gelatine	0.5 pounds
Vanilla extract	0.5 pounds
Total	14 pounds

Step 2: Calculate the composition of the basal part per 100 pounds of ice cream mix:

1. 100 pounds minus 14 pounds equals 86 pounds of basal part.

2. Determine the amount of 35 per cent cream necessary to furnish 12 pounds of butterfat for every 100 pounds of mix. Since the required percentage of butterfat is 12 and the "butterfat factor" for a 35 per cent cream 2.85 therefore, 12 times 2.85 equals 34.20 pounds of 35 per cent cream will provide the required amount of butterfat.

3. How much of the basal part should consist of "separator skim milk" and powdered skim milk?

86—34.20 equals 51.80 pounds.

4. Determine the amount of solids not fat contained in 34.20 pounds of 35 per cent cream.

a. 34.20—12 equals 22.20 pounds of skim milk.

b. 22.20×.09 equals 1.99 pounds solids not fat.

5. Calculate the quantity of solids not fat to be supplied by the skim milk on hand.

10—1.99 equals 8.01 pounds solids not fat.

6. What is the percentage of solids not fat if 51.80 pounds of skim milk contain 8.01 pounds of solids not fat?

$$\frac{8.01 \times 100}{51.80} = 15.46\%$$

7. Standardize your skim milk accordingly: Use Pearson's Square Method.

Separator skim milk	9	79.54
required	15.46	

Powdered skim milk 95 6.46

Hence 79.54 parts of separator skim milk must be used for every 6.46 parts of powdered skim milk, or in the proportion of 12.31:1. Thus, to make up 51.80 pounds of skim milk which will supply 8.01 pounds of solids not fat, use 47.91 pounds of separator skim milk and 3.89 pounds of powdered skim milk.

Step 3. Tabulate mix as calculated:

Part	Ingredients	Butter-		Milk solids not fat lbs.	Total solids lbs.
		Sugar lbs.	fat lbs.		
34.20 lbs.	35% cream.....	0	12	1.99	13.99
3.78 lbs.	powdered skim.....	0	0	3.70	3.70
47.91 lbs.	separator skim.....	0	0	4.31	4.31
Complimentary.					
13 lbs.	cane sugar	13	0	0	13.00
0.5 lbs.	gelatine.....	0	0	0	0.5
0.5 lbs.	extract	0	0	0	0
Total 100 pounds.....		13	12	10.00	35.5

The "butterfat factor" is obtained by dividing 100 by 35 giving a quotient of 2.85.

World's Dairy Congress Excursions

A NUMBER of important excursions are being arranged for the benefit of delegates who come from abroad to attend the World's Dairy Congress. The Congress will hold its opening session at Washington, D. C., on Oct. 2 and 3, adjourn to Philadelphia for Oct. 4, and continue at Syracuse, N. Y., from Oct. 5 to 10, in co-operation with the National Dairy Exposition. Short automobile excursions in and about each city where the Congress will meet will be conducted at little or no expense to the delegates. Three excursions of greater length will be offered in advance of the Congress and one excursion of from four to five days' duration, after the Congress.

All excursions are designed to present the most modern developments in cattle breeding, milk producing, milk handling, dairy products manufacturing and dairy machinery, as well as to show many places of historic and scenic interest. Every effort has been made to keep the cost of the excursions as low as consistent with comfort and the proper observation of important places. Influential leaders of many sections of America have extended through the World's Dairy Congress Association personal invitations to delegates to visit their respective states.

The excursions to be held prior to the Congress are

intended for delegates with from two to three weeks' time for sight-seeing and for inspecting places of dairy interest before October 2. The excursion to be held after the Congress will show delegates many of the features of the American development of dairying and will supplement the short trips planned as part of the Congress program. The excursions to be run prior to the Congress will be as follows:

No. 1—Pacific Coast Excursion; time thirty-three days; approximate cost, \$350.00.

By train from New York City, August 28, to Madison, Wis.; to St. Paul and Minneapolis, Minn.; to Seattle, Wash.; to Portland, Ore.; down the Pacific Coast to Sacramento, Cal., to San Francisco, Cal., to Los Angeles, Cal.; to Salt Lake City, Utah; to Ames, Ia.; to Waterloo, Ia.; to Chicago, Ill.; to Washington, D. C., in time for the opening of the World's Dairy Congress. This trip will show delegates dairying establishments, the great cheese producing country of Wisconsin, colleges of agriculture and university farms, irrigation and dry farming projects and the annual Iowa Dairy Cattle Congress.

No. 2—Central West Excursion; time, seventeen days, approximate cost, \$150.00.

By train from New York City, September 15, to Chi-

cago, Ill.; to Milwaukee, Wis.; by motor to Waukesha, Wis.; to Fond du Lac, Wis., and Madison, Wis.; by train to St. Paul and Minneapolis, Minn.; by motor through southern Minnesota and northern Iowa to Ames, Ia., and Waterloo, Ia.; by train to Chicago, Ill.; to Washington, D. C., in time for the opening of the World's Dairy Congress. This trip will show delegates milk plants, cattle breeding farms, dairy establishments, colleges of agriculture, creameries, cheese and butter plants and annual Iowa Dairy Cattle Congress.

No. 3—Eastern States Excursion; time, twelve days; approximate cost, \$150.00.

By train from New York City, September 19, to Springfield, Mass.; to Buffalo, N. Y.; to Niagara Falls, N. Y.; to Grove City, Pa.; to Pittsburgh, Pa.; to Pennsylvania State College, Pa.; to Baltimore, Md.; to Washington, D. C., in time for the opening of the World's Dairy

Congress. This trip will show delegates the Eastern States Exposition, with its cattle displays and exhibits of boys' and girls' club work, the great cataract at Niagara Falls, a government butter and cheese plant, city milk plants, institutions of learning, agricultural and dairy farms.

Another Eastern excursion to places of interest near New York City and Philadelphia and in New Jersey will probably be announced later.

The excursion which will follow the Congress will be:

No. 4—New York State Excursion; time, three days; cost, slight.

Leave Syracuse, N. Y., by train or motor, October 11; visit dairy farms, cheese and butter plants, condensed milk and milk powder factories, agricultural and dairy schools. Excursion ends at New York City.

Clean Advertising Supported by Supply Association

THE Association of Ice Cream Supply Men has actively entered the lists in support of clean advertising.

On the principle that the ideal in commercial advertising is that publication, direct mail, and other special forms of advertising, oral included, should have a value, in the presentation of goods or services for sale, equivalent to bonded statements, the national organization of supply houses has announced its support of the National Association of Ice Cream Manufacturers in establishing absolutely fair and judicious advertising in connection with the ice cream industry of the continent.

In 1917 the National Association of Ice Cream Manufacturers issued a pronouncement drawn up by its advertising committee declaring certain advertising practices injurious to the industry as a whole or plainly untruthful or unfair. In 1922 it re-issued this pronouncement.

In February of this year The Association of Ice Cream Supply Men appointed a vigilance committee charged in part specifically with exerting the association's authority in support of the national association's advertising pronouncement.

This vigilance committee of the organized supply men is now working in co-operation with a vigilance committee of the National Association of Ice Cream Manufacturers, also appointed several months ago.

After various meetings and a study of conditions, The Association of Ice Cream Supply Men's vigilance committee has issued a statement to all members of the association and has accompanied it by a copy of the advertising pronouncement of the National Association of Ice Cream Manufacturers.

The statement of the supply men's vigilance committee follows:

To Members of the Association:

The vigilance committee of The Association of Ice Cream Supply men was appointed in February, 1923, to co-operate with the vigilance committee of the National Association of Ice Cream Manufacturers in bringing about an adherence by members of the association and by others to the declaration on advertising issued by the latter organization in 1917 and reissued in 1922.

That declaration is in the form of a statement by an advertising committee of the National Association of Ice Cream Manufacturers "to advertisers of ice cream machinery, utensils, supplies, etc."

The Association of Ice Cream Supply Men went on record three years ago for fair practices in selling. We all know that advertising is a part of selling, just as selling is the resultful part of advertising. The two overlap or blend at many points. It can never be said with full truth that the

association is living up to the fair practices in selling which it has sponsored unless and until it lives up also to fair practices in advertising.

The declaration on advertising by the National Association of Ice Cream Manufacturers has been brought to your attention through the association offices in Confidential Trade Letter No. 200, dated March 6. The vigilance committee is bringing it now, a second time, more particularly to your attention.

It is known by the committee to be the desire of the National Association of Ice Cream Manufacturers to "clean up" advertising to the ice cream industry in cases where injudicious, injurious, unfair, exaggerated statements are being made, and to keep all advertising to the industry "cleaned up." It is known to the committee that the National Association of Ice Cream Manufacturers is requesting its members to cite specific instances to the National Association of Ice Cream Manufacturers of a disregard by supply houses of the definition of proper advertising which the national association has established.

As the principal group of supply houses in the country, both numerically and in business done, members of The Association of Ice Cream Supply Men will be naturally looked to for clean and proper advertising, and more so than all, because of their sponsorship of the Fair Practices Code. The association has charged this committee with co-operating with the National Association of Ice Cream Manufacturers. The obvious, proper and necessary way to afford such co-operation is to bring the influence and the authority of The Association of Ice Cream Supply Men to bear among its own membership in support of the national association's declaration on advertising.

This practical and active co-operation the vigilance committee is prepared to give. Cases, therefore, of advertising considered unfair, injudicious, injurious, exaggerated, etc., etc., cited to the committee will be promptly considered by it and such action taken as may be necessary.

INDIANA'S OLD-EST ICE CREAM PLANT.

Robert Glass of Madison, Ind., operates one of the oldest ice cream manufacturing plants in the country, the business having been established by his grandfather, Jacob Glass, and C. Friedersdorf in 1858. The enterprise was first started as a confectionery. Jacob Glass was killed in the civil war.

Frederick Glass, father of the present proprietor, went to work in the business as an apprentice in 1871, ice cream being made in the building before this time. Robert Glass was born in the building.

Are Your Profits Absorbed by Cabinet Replacements?

Our trough cabinet with taper wood lining instead of metal. Substantial, efficient and like all our cabinets, attractive in appearance.

INVESTIGATION shows that the greatest percentage of cabinet repairs and replacements are due to leaky and corroded metal linings of the ice chamber.

Note in the cross section illustration how Nelson Cabinets are lined entirely with wood. The quality of wood used resists the corrosive action of the salt brine and the manner in which the lining is inserted makes it leak proof. The $\frac{3}{4}$ inch drain valve (entirely of brass) greatly facilitates drawing off the brine.

Users of Nelson Cabinets do not have their profits absorbed by replacements of metal linings at the end of each season's business.

NELSON (Patented) WOOD LINED Ice Cream Cabinets LAST

CONSTRUCTED of Everlasting California Redwood, and insulated with cork, the best non-conductor of heat and cold known.

The scientific balance of insulation and refrigeration of Nelson cabinets saves 65% of the ice usually required for keeping ice cream in good condition.

How much would such a saving mean in your business?

LEAGUE OF NATIONS APPOINTS DAIRY CONGRESS DELEGATE.

The health committee of the League of Nations has designated Surgeon-General Hugh S. Cumming as its delegate to the World's Dairy Congress, according to a letter recently received by President H. E. Van Norman, of the World's Dairy Congress Association, from the Committee's Medical Director, Dr. Ludwik Rajchman. Surgeon-General Cumming, while not a regular member of the Health Committee, since the United States is not formally identified with the League of Nations, serves the organization in an advisory capacity. This enables him to represent the League at the Congress and to report back to the Health Committee the information of inter-national value brought out at the sessions. The Congress will hold its opening sessions at Washington, D. C., on October 2 and 3, adjourn to Philadelphia, Pa., for October 4 and continue at Syracuse, N. Y., from October 5 to 10. Dr. Rajchman was in Washington at the time of the Social Workers' Convention, when he explained to the Congress Association officials that the Council of the League of Nations had authorized the Health Committee to take any steps practical to help with the inter-national dairy meeting. He and Dr. Cumming left for Paris immediately after the convention to attend a meeting of the committee which would take up the question of how to aid the Congress movement. In telling about the resolution, passed at the Paris meeting to appoint a delegate to attend the sessions, Dr. Rajchman writes:

"The committee noted the Council Resolution of April 19th, 1923, and a memorandum from the president of the World's Dairy Congress and decided to ask Dr. Cumming, Surgeon-General of the United States Public Health Service, to agree to act as an intermediary between that Congress and the committee. Dr. Cumming having agreed, the committee decided that the communication from experts obtained through its members should be sent either to Dr. Cumming direct, or to the Health Section of the Secretariat."

GROSSE SUCCEEDS DRYDEN AS CALIFORNIA ASSOCIATION'S SECRETARY.

Robert F. Grosse was appointed secretary-treasurer of the California and Southwestern States Ice Cream Manufacturers' Association to succeed Robert Dryden at a special meeting held in Los Angeles on June 28.

Mr. Dryden will devote his time to his business, the Dryden Corporation of Oakland. He had served the association as secretary-treasurer for three years.

Mr. Grosse already has taken over his new duties. He also is managing secretary of the Southern California Ice Cream Manufacturers' Association. He has been identified with the ice cream industry for several years, and is enthusiastic over the outlook for the development of the California ice cream industry.

NEW YORKERS LIKE ICE CREAM.

According to a report made by Health Commissioner Monaghan of New York City, New Yorkers' ice cream appetite runs to 60,000,000 quarts a year. This means more than 10 quarts per person.

Lest You Forget!—The 23rd annual meeting of the National Association of Ice Cream Manufacturers will be held in connection with the second national exposition of The Association of Ice Cream Supply Men at Cleveland, October 22-27 inclusive.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

The Place Ice Cream Should Occupy

By W. A. WENTWORTH*

THERE is much discussion within the ice cream industry regarding the ways and means of establishing ice cream in the diet as a necessity rather than a luxury. In reviewing much of the discussion which has taken place in the previous ice cream conventions of this season as reported in the various ice cream trade publications, it appears that frequently the subject of the role of ice cream in the diet has been discussed.

To meet this type of discussion and at the same time, if possible, clinch within the minds of the American consumer the primary factor of food value in ice cream, the National Dairy Council is feeding certain animals in its colonies. They have, of late, produced many sets of animals of various types showing therein the value of dairy products in promoting proper growth and correcting nutritional ailments. Now they have undertaken by this same type of animal feeding to demonstrate what correctional qualities ice cream may possess.

There is much of this to be done in the future before very extensive publicity could or should be given to the startling results already accomplished but to you people as manufacturers of ice cream, the following statements can safely be made. The study of the correction of dietary deficiencies is based upon what is normally considered the business man's and the laborer's daily luncheon, such as doughnuts and coffee, ham sandwich and coffee, or a popularized plate luncheon so frequently made up of lean meat, potatoes, bread and coffee.

To show what effect may be developed by adding a correct and necessary dessert to such a luncheon, rats have been fed on this sort of standard diet to which has been added ice cream in one half of the instances.

In every case thus far, it has been found that when ice cream is used the nutritional deficiencies of those luncheons mentioned have been corrected and tremendous increases in growth and better health conditions developed in the animals so fed.

These facts, together with the statements which have been made by large numbers of the leaders of this industry, as well as nationally known nutritional workers that ice cream is a real food, should eliminate from the minds of any ice cream manufacturer the thought that he can best serve the public and serve himself by continuing to present to the minds of the consumer, whether it be child or grown-up, that his commodity should be classed among the luxuries although it has often been pointed out that the consumption of practically all types of so-called luxuries have been increasing during the past few years in the United States.

To analyze briefly just what is taking place within the ice cream industry and considering that as a part of the great dairy industry because it contains when properly constituted many, if not all, of the vital food elements of the other dairy products, let us compare the situation of production and consumption with these other dairy products. Then we may realize whether ice cream is maintaining or perhaps increasing in value in the public eye as is true of its fellow products.

In looking over the statistics of production of ice cream, I find some variances as they may have been reported by several agencies. The most complete record, however, seems to be one from the International Confectioner, which I assume has been compiled by Mr. L. O. Thayer. The following table presents the total gallon-

age produced annually in the United States from the years 1909 to 1922.

Per cent of total milk produced used in the manufacture of ice cream.

1909	80,000,000	...	1916	208,320,000	...
1910	95,450,000	...	1917	219,385,000	3.7
1911	138,000,000	...	1918	231,053,000	3.8
1912	160,000,000	...	1919	248,381,975	3.8
1913	172,380,000	...	1920	257,820,490	4.0
1914	163,761,000	...	1921	216,579,212	3.1
1915	175,224,270	...	1922	242,288,000	3.0

To this I have added for the years 1917 to 1922 the per cent of total milk products of the United States used in the manufacture of ice cream.

It will be noted from this that during the years 1921 and 1922 the ice cream industry has apparently failed to keep pace with the general dairy industry in the increase of production or manufacture which took place. In fact, in neither of these two latter years is the production in excess of the years 1919 and 1920.

In contrast to this when we consider the statistics of the other branches of the dairy industry, it is seen that during 1921 and 1922 there have been very large increases in production of both milk and butter and in no proceeding year has the production of these products approached the volume of these years. Each of these together with ice cream is presented to you in the following table in terms of annual per capita consumption:

Annual Per Capita Consumption.

Year	Ice cream gal.	Milk gal.	Butter lbs.
1910	1.0	33	17.5
1911	1.4	17.0
1912	1.65
1913	1.75
1914	1.65	16.5
1915	1.75
1916	2.06
1917	2.14	42.5
1918	2.24	41.0	14.0
1919	2.38	42.5	15.5
1920	2.46	43.0	14.7
1921	2.04	46.0	16.1
1922	2.26	50.6	17.5

The reported consumption for 1922 in each instance is a preliminary figure subject to later revision when more facts are available, but in the instance of milk and butter are certainly a conservative estimate whereas ice cream as accurate as are the statistics of the preceding years. The per capita use of ice cream was highest in 1920 with a decrease in 1921 of seventeen per cent and then an increase of 10.8 per cent in 1922. The consumption in 1922 was approximately the same as in 1918. In the case of milk there has been an increase of 14 per cent in 1921 and of at least eleven per cent in 1922 with the consumption of 9.6 gallons or 23 per cent higher than in 1918. With butter substantially the same ratios prevail as is true of milk.

In the presentation of these statistics there is no purpose in mind of censuring the ice cream industry for everyone engaged in the great dairy business realizes that the very effective work in stimulating manufacture and sale of ice cream has been a very valuable asset to the whole industry. It would seem, however, that during the years 1921 and 1922 there has not been an advantage taken of the possibilities for interesting the consumers of America in the use of that product as has been true in the case of the other two dairy products.

QUALITY, SANITATION AND INCREASED SALES.

By T. S. Blair.

In this day of frank criticism, quality in the eye of the great American citizen slangily means an absence of grease. The greasy restaurant is no more censured by the average citizen than is the greasy ice cream parlor. Greasy counters and table tops are often the cause of lost customers. And of equal import, is that the glass or china in which you serve your frozen confection, and the spoon offered to the customer, have a "feel" absolutely free from grease and grime. The residue left on spoons from a supposedly careful wash, but one not capable of complete rinsing, has disgusted many a patron of your business. (For ice cream eaters really are the manufacturer's patrons.)

Ice cream manufacturing and retailing today is a science as compared to the crude methods used but a few years ago. The retailer, especially, has made gigantic strides in sales methods and the use of pleasing equipment. So, too, cleaning today is a science as practiced in retail ice cream establishments, as compared to the methods of past days. But scientific, sanitary cleaning in your establishment today necessitates less labor, less equipment, and less cost than the greasy, antiquated system of days gone by.

The careful manager of retail ice cream parlors realizes that sanitary cleanliness is not a passing whim, but an aggressive agent in the fight for business. With such in mind, he uses only those compounds that most easily and quickly clean his glass, china and silver; leave their surfaces free of greasy films; completely rinse; and require the least expenditure to do the year's washing job.

NEXT NEW ENGLAND MEETING IN SEPTEMBER.

New England ice cream manufacturers are looking forward to their September meeting. This will be the resumption of the regular monthly meetings, which were temporarily suspended with the June session because of hot weather.

The following new members were announced at the last meeting: Active, Mayflower Ice Cream Co., Providencetown, Mass.; associated, Charles C. Lowitz, Boston, Mass.

Plans were discussed for participation by New England manufacturers in the health show to be held at Boston.

ARCTIC ICE CREAM COMPANY ACQUIRES TWO PLANTS.

Announcement was made recently that the Arctic Ice Cream Co., of Detroit, has purchased the Freeman Dairy Co., of Jackson, Mich. This makes the second plant in the state to be acquired in June. The Michigan Ice Cream Co., of Lansing, having been acquired earlier.

The Arctic Ice Cream Company is now operating in Detroit, Grand Rapids, Lansing, Fenton, Grand Ledge, Jackson, Holland and Hastings. It does an annual business of \$4,000,000.

Lest You Forget!—The 23rd annual meeting of the National Association of Ice Cream Manufacturers will be held in connection with the second national exposition of The Association of Ice Cream Supply Men at Cleveland, October 22-27 inclusive.

PROSPERITY FOLLOWS THE DAIRY COW. Be sure you attend the National Dairy Exposition—Syracuse, N. Y., Oct. 6-13.

your dealers
will appreciate

Its solid stem, of a length just right for every thickness of cabinet, makes a perfect leak-proof brine drain.

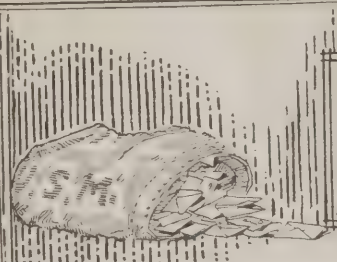

The special mixture of metal is rust proof and will not corrode.

Order a few for replacement purposes or new cabinets. You will profit by their quality and practicability.

SMITH & MANN

914 West York St. Philadelphia, Pa.

PROFESSOR BAER'S INQUIRY DEPARTMENT

Dear Sir:—I am sending you a formula that I am using and would like to know if it is too high in fat (I want about 10 or 12 per cent fat), serum sol., or total solids. Also please advise if unsweetened condensed milk is as good or better than evaporated milk, the unsweetened costs us about 42c a gallon, while the evaporated will cost about 72c. Which do you think is the cheaper? The formula I am using at the present is:

412 lbs. 4 per cent milk.
196 lbs. 8 per cent evaporated milk (Libby's).
196 lbs. 40 per cent cream.
30 lbs. skim milk powder.
140 lbs. sugar.
6 lbs. gelatine.

Reply: I should like to know the complete composition of the unsweetened condensed milk and how far you have to ship this product. Unless you have condensery rather close to your plant, it would hardly be possible to use this product and I am, therefore, not suggesting a formula until I have further information.

The unsweetened condensed milk, whether the condensed skim milk or condensed whole milk, is preferable to evaporated milk, as it does not have the cooked flavor

that the evaporated milk gives the cream.

Most of our Oklahoma factories have to use the sweet condensed milk if they prefer to use condensed milk to milk powder. If I understand you correctly, this unsweetened condensed which you refer to is not sterilized product and will have to be shipped to you in 10 gallon cans.

Table 1.

Ingredients	Fat	Serum sol.	Total Sol.
412 lbs. 4 per cent milk.....	16.50	35.25	51.75
196 lbs. 8 per cent evap.....	15.68	35.28	50.96
196 lbs. 40 per cent cream....	78.40	10.47	88.87
30 lbs. skim powder.....		28.50	28.50
140 lbs. sugar.....			133.00
6 lbs. gelatine.....			5.70
980.0	110.58	109.50	358.78
Per cent	11.3	11.1	36.6
Per cent sugar, 14.4.			

* * *

Dear Sir:—Please send me two formulas. One for cream to contain 10 per cent butterfat, 13½ per cent sugar and to be made from whole milk, sweet butter and milk powder. Make it as heavy in total solids as it should be to stand 100 per cent overrun.

Another to contain 8 per cent butterfat, 14 per cent sugar and as much total solids as you consider it should have to bear 100 per cent overrun, the mix to be made with whole milk, sweet butter and milk powder. The gelatine content will run about .6 per cent. J. H. E.

Reply: I am glad to show below, in table one and table two, a 10 per cent and an 8 per cent 100 pound mix, made up according to the suggestions of your letter:

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
13.5 lbs sugar.....			12.82
.6 lbs. gelatine.....			.57
5.0 lbs. skim milk powder..		4.75	4.75
8.5 lbs. 84 per cent butter..	7.14		7.14
72.4 lbs. 4 per cent milk....	2.89	6.22	9.11
100.0	10.03	10.97	34.89

Table 2.

Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar.....			13.30
.6 lbs. gelatine.....			.57
6.0 lbs. skim milk powder..		5.70	5.70
6.1 lbs. butter, 84 per cent..	5.12		5.12
73.3 lbs. milk, 4 per cent....	2.93	6.26	9.19
100.0	8.05	11.96	33.88

Both of these mixes are high enough in solids to get 100 per cent overrun.

* * *

Dear Sir:—For years we have been shipping natural cream to the ice cream trade, and last season we began making a mix, using whole milk, 40 per cent cream, and plain super-heated condensed, four to one. Now we find a great many of the customers want the mix with the gelatine and sugar added. We have everything to work with, but never had any experience along this line.

Kindly send us full instructions on how to make a good mix containing 12 per cent fat, and 35 per cent

JUDGE NOT LEST YE BE JUDGED—CUT NOT LEST YE BE CUT.

solids. Be sure to give us information as to pressure we should use with our viscolizer. A. H. H.

Reply: I have your letter of February 24th, forwarded to me from The Ice Cream Review, Milwaukee, Wisconsin. I am suggesting below in Table No. 1 the ingredients for 100 pounds of standard mix used 40 per cent cream and 4 per cent milk and the plain condensed milk, which I figured at 30 per cent solids. You did not give either the percent of fat in the milk or the condensed.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar.....	13.30
.5 lbs. gelatine.....47
14.0 lbs. condensed, 30 per cent.....	4.20	4.20
25.5 lbs. 40 per cent cream..	10.20	1.36	11.56
46.0 lbs. 4 per cent milk....	1.84	3.96	5.80
100.0 lbs. mix.	12.04	9.52	35.33

If with these suggestions you do not have the matter made perfectly plain to you I suggest that you write again giving further details.

* * *

Dear Sir:—I herewith submit formula we are using and would like for you to analyze it. We are making a good cream with it, but some times we fail to get the overrun. We have a starter can that we use as a pasteurizer. First we place the sweet milk and the skim milk powder in and heat up to 120 degrees F. then we put in the sugar, heat up to 130 F. and put in the sweet butter, heat up to 145 F. put in the gelatine; hold for 30 minutes, run a Sharpless emulsifier then hold for 24 to 48 hours, then freeze in an old style tub and can with ice and salt:

14 lbs. sugar.
66 lbs. sweet milk, 4 per cent.
7 lbs. skim milk powder.
9 lbs. sweet butter, 84 per cent.
12 ozs. gelatine.
4 ozs. flavor.
8 lbs. water.

Reply: Please find below, in table 1, the analysis of your ice cream mix. You will notice that you have a mix testing nearly 10 per cent butterfat and 35 per cent total solids. If you are handling this mix as suggested in your letter, you are doing everything correctly and should not have any difficulty in getting the proper overrun. At any rate, this difficulty is not due to your mix. It is probably due to the fact that you are not aging the mix uniformly for the same time, or that some factor in the freezing is not uniform from day to day. It is quite difficult to secure uniformity with the old style salt and ice freezer unless the man at the freezer watches it very carefully.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar.....	13.30
66.0 lbs. milk, 4 per cent....	2.64	5.67	8.31
7.0 lbs. skim powder.....	6.65	6.65
9.0 lbs. sweet butter.....	7.56	7.56
1.0 lbs. gelatine and flavor..70
8.0 lbs. water.....
105.0	10.20	12.32	36.52
Per cent	9.74	11.7	34.8

* * *

Dear Sir:—Here are two formulas, showing the ingredients of the two different ice cream mixes which we are making. We wish you would please go over these two carefully and analyze them for butterfats, solid etc.:

Mix No. 1.

66 3/4 lbs. butter.
80 gallons water.
100 lbs. milk powder (skim).
120 lbs. sugar (granulated).
6 1/4 lbs. gelatine, high grade.
10 teaspoonsful salt
50 drams color.

Mix No. 2.

78 3/4 lbs. butter.
80 gallons water.
132 lbs. cond. skim milk, sweetened.
60 lbs. sugar.
80 lbs. skim milk powder.
6 1/4 lbs. gelatine (best grade).
10 teaspoonsful salt.
50 drams color.

We also wish you would give us any suggestions to these two mixes that you think would give us a better product. If you can better either or both of them, we would appreciate it you would standardize a mix for using the same ingredients. J. C. Co.

Reply: I have analyzed your two mixes carefully and you will find the calculations given below under the heading "Mix No. 1 and Mix No. 2:"

Mix No. 1.

Ingredients	Fat	Serum Sol.	Total Sol.
66.75 lbs. butter.....	56.07	56.07
100.00 lbs. milk powder.....	95.0	95.00
120.00 lbs. sugar.....	114.00
6.25 lbs. gelatine.....	5.94
.50 lbs. salt an decolor.....20
960.70	56.07	95.0	271.21
Per cent	5.84	9.9	28.25

Per cent sugar, 12.5.

*“One-half the labor—
one-third the time”!*

“We have operated one of these machines for a period of about one year and we not only feel that it is an efficient piece of machinery, but from our experience with brick cutting machines we feel that we can safely term it **the only really successful brick cutting machine on the market today.**

“The machine will cut pint and quart bricks at the same time, will cut any number of slices per quart from the slab and will turn out thousands of Eskimo Pie bricks per hour, all with one-half the labor and one-third the time required for any other brick cutting machine we have ever used. It is **absolutely accurate in its operation**; that is to say, in producing sliced bricks every slice is exactly the same size, which is a feature that we believe cannot be claimed by the usual brick cutting machine, the knives of which do not pass through the slab without returning.”

Mix No. 2.			
Ingredients	Fat	Serum Sol.	Total Sol.
78.75 lbs. butter.....	66.15	66.15
132.00 lbs. sweet condensed....	35.64	88.44
		(52.8 lbs. sugar)	
60.00 lbs. sugar.....	57.00
80.00 skim powder.....	76.00	76.00
6.25 lbs. gelatine.....	5.94
.50 lbs. salt and color.....20
667.20 lbs. water.....
1006.70	66.15	111.64	293.73
Per cent	6.57	11.09	29.19
Per cent sugar, 11.2.			

You requested that after analyzing these mixes I make suggestions for improvement. I doubt very much whether your mix No. 1 or No. 2 will make a satisfactory standard ice cream which you undoubtedly need in competition in your territory. You will notice that mix No. 1 apparently tests less than 6 per cent butterfat and mix No. 2, 6½ per cent. You will also notice that the total solids of both mixes is less than 30 per cent.

I am glad to suggest further on formula No. 1 and No. 2, two one-hundred pound mixes testing 8 per cent fat and having serum solids to balance this fat as well as containing a little more sugar. You will also notice that the total solids will in this way be raised to about 33 per cent.

FORMULA NO. 1. 1000 lb. for Mix No. 1.			
Ingredients	Fat	Serum Sol.	Total Sol.
140.0 lbs. sugar.....	133.00
6.0 lbs. gelatine.....	5.7
.5 lbs. salt and color.....
95.2 lbs. butter.....	80.00	80.00
116.0 lbs. skim powder.....	110.00	110.00
642.3 lbs. water.....
100.0	80.00	110.00	382.7

Per cent sugar, 14.00.			

This UNION Speedway Cutter

Will Put \$\$\$\$ in Your Pockets This Season

Better Let Us Send You One

A SIMPLE, accurate and speedy device which cuts 100 dozen bars per hour, or at the rate of 10,000 bars per day. The bars are all exactly alike. No guess work—no poorly shaped bars—and there's no waste of cream.

EASY TO OPERATE. The UNION Speedway is so simple, a 10-year-old child can cut bars with it accurately and speedily. One person with a UNION Speedway will cut ten times the bars, and do better work.

PERFECTLY SANITARY. With a UNION Speedway, the hands need not come in contact with the cream. **Quickly and easily cleaned.** Each part can be separately and thoroughly sterilized.

PRICE. List price of the UNION Speedway Ice Cream Cutter is \$25.00 net, cash with order, complete, including special attachments, permitting operator to cut either 16, 18, or 20 bars to the brick.

UNION STEEL PRODUCTS COMPANY, Ltd.

Dept. 52

ALBION, MICHIGAN

U. S. A.

FORMULA NO. 2. 1000 lb. for Mix No. 2.

Ingredients	Fat	Serum Sol.	Total Sol.
84.00 lbs. sugar.....	79.8
6.00 lbs. gelatine.....	5.7
140.00 lbs. sweet cond.....	37.80	93.8
		(56.0 lbs. sugar)	
95.2 lbs. butter.....	80.00	80.00
76.00 lbs. skim milk.....	72.2	72.2
.5 lbs. salt and color.....2
598.3 lbs. water.....
1000.0	80.00	110.0	331.7
Per cent	8.00	11.00	33.17
Per cent sugar, 14.00.			

I am sure that you will have no difficulty in making a firm and better quality of ice cream from these two formulas as well as getting a satisfactory overrun.

* * *

Dear Sir:—I formerly made 16 per cent ice cream. I am trying to make 12 per cent ice cream, but with poor success, from the following formula:

	Fat.
63.5 lbs. 18 per cent cream.....	11.43
13.0 lbs. skimmed milk.....	0.
8.0 lbs. evaporated, 8 per cent.....	.64
14.00 lbs. sugar.....	0.
.75 lbs. gelatine.....	0.
.75 lbs. vanilla.....	0.
100.00	12.07

My cream settles, leaving it snowy and fluffy on top heavy on bottom and rough throughout. I use a continuous disc freezer. Please criticise and make suggestions for my benefit.

J. D.

Reply: I have your letter of recent date relative to present ice cream formula, and the apparent trouble which you have with the ice cream settling in the can leaving it snowy and fluffy on the top.

I am indicating below in table one, your formula showing the butterfat, serum solids and total solids calculated:

Table 1.			
Ingredients	Fat	Serum Sol.	Total Sol.
63.5 lbs. 18 per cent cream...	11.43	4.64	16.07
13.0 lbs. skim milk.....	1.16	1.16
8.0 lbs. evap. milk, 8 per cent	.64	1.44	2.08
14.0 lbs. sugar.....	13.30
.75 lbs. gelatine.....71
.75 lbs. vanilla.....11
100.0	12.04	7.24	33.43

You notice that the total amount of milk solids is 19.24, which is a little lower than I have been recommending for a number of years. I believe an ice cream containing 12 per cent butterfat should contain 21 per cent milk solids. This would mean that you would have to add about 2 lbs. of skim milk powder to your formula to bring up the solids. I believe you would find the use of skim milk powder in addition to the 8 lbs. of evaporated milk, very desirable. This extra solid should assist you somewhat in preventing the cream from settling.

However, I believe your entire trouble in this respect is due to the use of the continuous disc freezer. The freezer if not very carefully operated, and I have seen very few of them operated correctly, will not produce the body and smoothness to the product that the batch freezers will. The disc freezer does not beat the air into the cream like a batch freezer, but leaves it more or less foamy. When cream of this kind is hardened, and it is possible that you are not hardening your cream fast enough, the heavier solids will settle to the bottom, leaving the top of the can more or less porous and snowy.

Referring to a publication on ice cream, I suggest

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

Increase Sales

CONSUMERS PREFER to buy packaged foods, and usually the appearance of the container has a great deal to do with their opinion of the product. There is no better way of increasing ice-cream sales than by giving the public what it wants.

If you seek a distinctive package with a sales appeal—investigate Character Cartons. These durable, good-looking, well-finished cartons are obtainable in all sizes including individual cartons, and are reasonably low in price. Their superiority in selling appeal and in protective value carry no price penalty.

A postal request for information will bring you estimates and samples of our work including some carefully worked-out stock designs. Our facilities are such that even the smallest order receives the promptest attention both in execution and shipment. Sutherland Paper Co., Kalamazoo, Mich.

Character
Cartons
for Ice Cream

Sutherland Paper Co.

OUR ADVERTISERS ARE YOUR FRIENDS—BUY FROM THEM.

you get a copy of "Ice Cream Mix," published by the Olsen Publishing Co., Milwaukee, Wisconsin. This gives you a list of a lot of formulas, all of which are standard and have been tried out with satisfactory results.

I was glad to know that you are a U. W. graduate. You finished the University quite a while before I did. I received my degree in 1910.

* * *

Dear Sir:—Every few days we will have a five gallon can of ice cream drop. It will pull away from the sides of the cans and just drop right down, sometimes with a depression in the center and sometimes without this depression. The cream will taste all right and will eat all right. On weighing up a can we have found that it has, invariably, been extra heavy, which eliminates the chance of too much overrun. We are running on a ninety per cent overrun at this time of the year. We are making a 35 per cent solid and 12 per cent fat cream. That is, 35 per cent total solids. Have made no change in the formula or process. When the trouble first started this season, we changed gelatine but have still had some trouble with it. Have you run across anything like this in your work?

M. R.

Reply: You did not state in your letter whether you are now using a considerable quantity of sweetened condensed milk. We found, for instance, that one factory that had this trouble was using too much of this sweetened condensed heavy milk. This seems to settle to the bottom of the can and cause the cream to drop, especially when shipped or hauled by truck. In another factory we traced this condition to the use of invert sugar syrup, which also settled before the cream was hardened in the hardening room. In still another factory we traced it to the method of drawing cream from the freezer. In this factory, the man at the freezer occasionally drew

the cream too soft. The cream as it came from the freezer had air pockets and apparently was quite foam.

They eliminated the trouble in this factory by leaving the ice cream in the freezer a little longer and freezing the cream stiffer.

I do not believe that the gelatine you used was the cause of any trouble of this kind.

* * *

Dear Sir:—I would thank you to figure out an ice cream mix containing 12 per cent butterfat, 14 per cent sugar, 9.50 per cent serum solids, $\frac{1}{2}$ of one per cent gelatine. Our present mix is running 13.75 per cent butterfat, 16 per cent sugar, 9.18 per cent serum solid and $\frac{1}{2}$ of one per cent gelatine. We have just started to use 5 ozs. of powdered egg yolk to 10 gallons of finished ice cream, and when you figure out this mix figure the number of pounds of egg yolk. Our overrun has been running 90 per cent, and would like to know what overrun we should get with the mix you will figure. I would also like to know how to test an ice cream mix for butterfat on a Babcock tester. Kindly figure out a mix that can be handled in a 500 gallon Cherry pasteurizer. We are using 40 per cent cream, and 3.6 per cent milk, and skim condensed milk 20 per cent serum solids approximately. The mix is pasteurized to 145 degrees F., and viscolized at 2500 pounds pressure per hand then cooled to 40 degrees F. and held in 500 gallon Elyria glass enameled tanks for 48 hours.

How can I arrive at the percentage of serum solids in skim condensed milk without a Mojonnier tester? I operate a Creamery Package concentrator, and I tested some with a Baume hydrometer, and the reading was 11 at 60 degrees F. I could probably get better results if I had a hydrometer graduated into 1/10 divisions.

What is your opinion in regards to using egg yolk? It costs 60c per pound, and using it with our old mix runs the cost up a little higher than I can afford, and produces ice cream out with ice-up service for \$1.20 per gallon.

Reply: Acknowledging receipt of your recent letter I am glad to indicate below in table one, the formula calculated according to directions in your letter:

TABLE 1.
400 Pound Mix.

12% fat	9.5% S. S.	.5 lbs. gel.	14.0 sugar.
480 lbs. fat	380.0 lbs. S. S.	20.0 lbs. gel.	560 lbs. sugar
25 lbs. egg powder.			
Ingredients	Fat	Serum Sol.	Total Sol.
560.0 lbs. sugar.....	532.0
20.0 lbs. gelatine.....	19.0
25.0 lbs. egg powder.....	20.0
1150.0 lbs. 20% cond.....	230.0	230.0
1098.0 lbs. 40% cream.....	439.2	157.0	637.0
1147.0 lbs. 3.5% milk.....	41.3
4000.0	480.5	387.0	1438.0
Per cent.....	12.01	9.6	35.94

A five hundred gallon pasteurizer would not hold conveniently over four thousand pounds of mix, so we have made your formula total four thousand pounds. This mix will have nearly 36 per cent total solids and you should be able to get 100 per cent overrun. This would make your ice cream weigh four and one half pounds to the gallon or twenty-two and one-half pounds to a five gallon can.

Relative to the use of a Baume hydrometer, I am not able to tell you whether your reading of 11 at 60 degrees F. means 20 per cent serum solids. I suggest that you prepare a number of samples of your condensed milk, carefully noting the Baume reading and send the samples to your agricultural college for a solids determination. You could then soon arrive at the correct Baume reading for certain solids. There are hardly

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

The left container, in the above illustration, has a mix of ordinary water-ice ready for the freezer. To the mix in the right container, Textor is being added. Both will now be frozen.

Repacked, the ordinary water-ice is tasteless, snowy slush at the top, and a sweetish, syrupy substance at the bottom. But the Textor-made water-ice is even-textured throughout, smooth as velvet, with the flavor and color of fresh fruit juices; as perfect as when it first came from the hardening room.

When watered down, the ordinary water-ice contains scratchy ice crystals, is rough-textured and uneven in color. The Textor-made water-ice, although softened, is smooth, even, of uniform color and structure.

Better Water-Ices Build Better Business

A Graphic Illustration of How Manufacturers are Broadening Their Markets

REPACK an ordinary water-ice and you are starting trouble. It cannot hold its evenness of texture, color or flavor. But a Textor-made water-ice, repacked, is as delightfully perfect in every respect as when originally frozen.

The ordinary water-ice is practically flavorless at the top of the container while at the bottom it is a concentrated, syrupy substance. A Textor-made water-ice has its tempting flavor evenly distributed throughout.

The top of a container of repacked ordinary water-ice is pale and weak in color; the bottom is strong and intense. Neither is appetizing. But a Textor-made water-ice sells so well because from top to bottom its color is always just the color of fresh fruit.

Repacking destroys the structure of an ordinary water-ice, making it rough and scratchy, or thick and syrupy. No matter how many times you repack a Textor-made water-ice it remains smooth, and nothing can change that smoothness.

Test Textor Today

We'll be glad to send you a 60-pound drum of Textor with complete instructions and recipes. Ten pounds of it will stabilize 350 gallons of water-ices or sherbets. Notice the improvement when you have used Textor. Write us today.

S. GUMPERT & CO.

Bush Terminal

Brooklyn, New York

Textor

A blend of vegetable gums, a pure white powder, transparent, colorless, odorless and tasteless when dissolved. Requires no heating, soaking or boiling. Textor binds together the ingredients of an ordinary water-ice into one smooth, firm, perfect blend that will not disintegrate. Textor makes water-ices as dependable as ice cream.

two hydrometers which would check on the same condensed milk, therefore, it would be difficult to give you this data.

Relative to the use of egg yolk, I am sure that this will improve your ice cream mix and also give you color.

If you do not seem to get satisfactory results which was formerly suggested in table one, we might work it over a little bit. For instance, it is in my opinion not necessary to have over 8.5 per cent serum solids and 12 per cent butterfat. It is not desirable to have your mix extremely heavy. I am sure that the mix you have been running, 13.75 per cent butterfat, 16 per cent sugar and 9 per cent serum solids, etc., is a little too heavy and it is possible that your overrun was somewhat difficult to get due to that fact.

Dear Sir:—Please figure out a mix that would conform to the law and also yield 100 per cent overrun. There are two things wanted in this cream—quality and 100 per cent overrun.

C. B. S.

Reply: I suggest that you try a formula with 14 per cent sugar, $\frac{1}{2}$ per cent gelatine, 10 per cent butterfat and about 11 per cent serum solids. This would mean that for 100 pounds of mix you would use 14 pounds sugar, $\frac{1}{2}$ pound gelatine and 5 pounds skim milk powder, providing you want it to test 10 per cent. If you want it to test 12 per cent, 4 pounds of powder will be sufficient. This will give you approximately 35 per cent total solids and you would have plenty of solids to get 100 per cent overrun.

If you will hold your mix eight hours after making it up, you should have no trouble getting the overrun even with your upright freezer.

Relative to the acidity test, I suggest you order from the N. A. Kennedy Supply Co., Oklahoma City, Okla., a Nafis Acidity Test outfit, which includes the alkali indicator and the buretter attached to the bottle. You will remember that piece of apparatus here at our building.

Dear Sir:—I am sending you my directions for making ice cream, which seems to lack body and smoothness. 40 quarts whole milk; 25 pounds sugar; 18 ounces gelatine; 5 gallons condensed milk; 3 pounds evaporated milk; 5 pounds 50 per cent cream; 4 ounces Washburn cream ripener; 3 ounces vanilla for every 10 gallons.

Reply: You will find below in table number 1, the analysis of your mix, as best as I could figure it out from the information given in your letter.

I cannot understand why your ice cream should lack body and smoothness as you have plenty of milk solids. It is possible, however, that you have trouble with sand-

iness in your cream, and I would suggest to improve your mix, you would reduce the amount of condensed milk so as to lower the serum solids to 10 per cent, where you now have 12.38 per cent. When you do that you can still keep the total solids the same by using more sugar. You should use at least 13 per cent where you now only have 11 per cent.

If these suggestions do not overcome your difficulty, I suggest that you give me further details and I shall be glad to help you further.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
40 qts. or			
86.0 lbs 4% milk	3.44	7.2	7.64
25.0 lbs. sugar			23.75
1.5 lbs gelatine & Washburns			1.42
45.0 lbs. condensed		12.15	12.15

Per cent	11.4	12.38	33.7
Per cent sugar	11.1		

* * *

Dear Sir:—I have been having considerable trouble with sandy ice cream and wish to ask you if you think it possible to avoid this trouble with the use of milk powder. The mix that I am now using is as follows: 60 gallons 15 per cent homo. cream; 20 gallons 8 per cent superheated condensed; 84 pounds sugar; 4 pounds gelatine; three-fourths pound Washburn improver, this mix makes 170 gallons finished product.

Kindly give me a formula that will test 10 per cent butterfat, 14 per cent sugar, 33 per cent solids using milk powder instead of superheated condensed, and the proper method to mix the powdered milk. T. M. T.

Reply: You will find in Table 1, the analysis of your present ice cream mix. You will notice that it figures 11.5 per cent fat and only 31.7 per cent total solids. This is due to the small amount of sugar in your mix, unless the condensed milk which you are using contains sugar.

Most ice cream factories are now using from 13 to 14 per cent sugar. I am suggesting in Table 2, a 700 pound mix, 10 per cent fat and 14 per cent sugar. You will notice that in order to get the mix to 700 pounds about 100 pounds of water is necessary. If, however you had either whole milk or skim milk to mix with the 15 per cent cream, it would not be necessary to use water.

I suggest that you look over these two formulas carefully and see if this will solve your difficulty.

Dear Sir:—Small lumps of butter form in our cream and we cannot seem to remedy it. Our freezer seems to remedy it. Our freezer seems to be running the right speed so hardly think this is the trouble. We freeze ten minutes, then whip five minutes. C. C. C.

Reply: This condition is more prevalent in the spring of the year when the cows are on fresh, succulent pasture, and also because a large proportion of fresh succulent pasture, and also because a large proportion of fresh cows are in the herds at this time of the year.

The best way to overcome this difficulty is to try to have the mix as cold as possible before freezing and then complete the freezing process with the least amount of agitation. I doubt whether you improve your mix very much by whipping five minutes after you have frozen ten minutes. I imagine that if you would try to

complete the entire process in about twelve minutes you would have less of this trouble.

* * *

Dear Sir:—Our mix contains 12 per cent fat, 12 per cent sugar, total solids 35 per cent. We want to sell finest possible commercial cream. How much overrun will mix stand?

Reply: Your ice cream made from the mix as stated in your wire would very easily stand from 100 to 105 per cent overrun and still be a very fine commercial product.

* * *

Dear Sir:—Will you kindly have the following formula analyzed and tell me, if possible, the following: fat content; total solids:

120 gallons 3.5% milk.
90 gallons 20% cream.
90 gallons 8% unsweetened cond.
22 lbs. gelatine.
400 lbs. sugar.
1 3/4 gallons flavor.

Reply: I am glad to illustrate below, in table 1, calculations showing the analysis of your ice cream mix as indicated in your letter:

Table 1.

Ingredients	Fat	S. S.	T. S.
120 gal. or 1032.0 lbs. 3.5% milk..	36.12	88.65	124.77

Per cent	8.35	9.5	31.28
Per cent sugar, 13.0.			

* * *

Dear Sir:—Would you tell me what you think of a mix that tests 14.40 per cent fat, 10.50 per cent skim solids, 39.50 total solids, and 14 per cent sugar? Please mail me answer. I am enclosing stamp.

Reply: If I have any criticism to make on this mix it is that the total solids are too high. I would not attempt to make ice cream from a mix containing over 35 per cent total solids. I would suggest that you reduce the butterfat content to about 12 per cent, reduce the sugar 1 per cent and leave the serum solids as you have it now, about 10 per cent.

* * *

Dear Sir:—Below find ice cream formula we are using which we will thank you to analyze. We are getting from 75 to 80 per cent overrun but think same should be at least 90 per cent, and will appreciate very much any suggestions you can make to improve our mix and obtain the desired overrun.

We are using 53 1/2 lbs. butter, 25 1/2 lbs. skim milk powder, 55 lbs. sugar, 3 lbs. gelatine and 313 lbs. liquid skim milk for our 50 gallon mix. We run this mix through the homogenizer at about 2500 lbs. pressure and hold for 24 hours before freezing. Our figures indicate that the above mix contains about 10 per cent butterfat, 11 per cent milk solids not fat and 34 per cent total solids.

Reply: I have analyzed your mix and you will find the analysis given below in table 1. The analysis of this mix shows that you have plenty of solids and could easily stand an overrun from 90 to 100 per cent.

I imagine that the difficulty which you have is due to the manner in which you handle the mix, or possibly in the freezer. You stated that you held your mix 24 hours before freezing. It is possible that this is not long enough to get the maximum overrun. Many factories throughout Texas and New Mexico have found it neces-

sary to age the mix from 36 to 48 hours. This makes it necessary to install a new holding vat which sometimes cannot be done.

It is possible that you are putting too heavy a load into the freezer, and I would try to put about a gallon less mix into the freezer and see if you get more overrun. Then, there might be something wrong with the speed of your machine or the time it takes to freeze.

I should be glad to have you write to me again if you think that any of these other factors might be the cause of your trouble.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.

Table No. 3.

100 lb. Mix—8% fat, 12% Serum Solids.			
Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar.....	13.30
.5 lbs. gelatine.....47
6.0 lbs. skim milk powder..	5.70	5.70
31.5 lbs. 20% cream.....	6.30	2.24	8.54
48.0 lbs. 3.5% milk.....	1.68	4.14	5.83
100.0	7.98	12.08	33.74

Dear Sir:—Please give me a formula to be made from sugar, sweet butter, purity powder and 4 per cent sweet cow's milk. Would you advise the use of purity powders in this mix? I want formula for 100 lb. mix.

I have an Emery Thompson brine freezer. How many revolutions is the dasher supposed to make to get a 100 per cent overrun, and what temperature is best to freeze at with this freezer? How fast should the brine pump be run?

Reply: I have your letter of recent date, with request for a formula for a 100 pound mix. I am suggesting below in table No. 1 how such a mix could be made up to comply with your 8 per cent law in Arkansas.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar.....	13.30
.5 lbs. gelatine.....47
4.0 lbs. skim milk powder..	3.80	3.80
6.0 lbs. 84% butter.....	5.04	5.04
75.0 lbs. 4% milk.....	3.02	6.45	9.47
100.0	8.06	10.25	32.08

I cannot give you the number of revolutions required for your Emery Thompson freezer to get a certain overrun, as the overrun varies with a great many other factors, such as the temperature of the brine; the flow of brine through the freezer; temperature of mix to begin with and temperature at which drawn from the freezer.

I notice that you wanted to use purity powder for a filler, instead of gelatine. I am suggesting in the formula ½ pound of gelatine, but if you want to use the powder you can easily substitute the equivalent amount of powder for the gelatine.

* * *

Dear Sir:—Will you kindly advise us and write me regarding the following mix we are using:

- 1000 lbs. 3½% sweet milk.
- 150 lbs. sweet butter, (82% fat).
- 24 lbs. skim milk powder (Merrill-Soule).
- 130 lbs. cane sugar.
- 10 lbs. gelatine (dissolved in 3 gal. water).
- 3 lbs. meloine (dissolved in 2 gals. water).
- 1 gallon vanilla extract.

We pasteurize the whole mix, except the meloine and flavoring, and run it through a viscolizer at 2,000 lbs.

*A beautiful
Ice Cream Poster
lithographed in
eight colors*

SIZE:

20 inches by 27 inches

Here is a most beautiful and powerful ice cream poster which will increase ice cream sales.

It tells the story of the food value of ice cream in a striking and interesting manner.

The National Dairy Council has only a few of these posters left and you should send your order in immediately in order to get a supply.

These posters are especially interesting and valuable to school teachers and others interested in telling the true story of ice cream.

You should arrange to have one of these posters placed in every drug store and confectionery window

in your city which handles your ice cream.

The price of these beautiful posters has been reduced and you can secure these posters in any quantities desired at a price of 5c each or \$50.00 per thousand. Imprinting your name and message will be \$2.50 per hundred additional if only 100 are ordered, while the cost of imprinting 1000 will be only \$7.50. This will mean the securing of 1000 beautiful posters for only \$57.50.

This unique poster is a good sales builder. It is such that it will build good will also. Do not overlook this opportunity. *Order your supply NOW.*

NATIONAL DAIRY COUNCIL

910 S. Michigan Avenue
CHICAGO

pressure direct to a Cherry batch mixer, circulating the coil with cold water running through it until the mix has reached a temperature of 60 degrees, then immediately cooling with ice water to 40 degrees, adding the dissolved meloine when the temperature has reached 50 degrees. The mix is left over night, about 20 hours, to ripen and to be frozen the following morning.

We use a Cherry motor driven perfection 40 quart freezer, and aim to have the brine about 8 degrees. This gives us a good smooth texture cream, but, we have difficulty obtaining over 90 degrees overrun.

What per cent of butterfat and solids does the above mix contain? Could you suggest a change in the formula that would increase the yield any? Do we ripen the cream long enough? What acidity should the cream and mix have before going to the freezer?

Do you prefer straight gum to meloine or any other ripener?

Kindly give us your formula for a 100 gallon mix made from 3½ per cent whole milk, sweet butter, skim milk powder, cane sugar, gelatine and gum or meloine, meeting the requirements of the 12 per cent Iowa Standard.

Would also like to have you give us a formula for sherbet. We are now using the following base:

35 lbs. sugar, dissolved in enough water to make ten gallons of liquid, adding ten ozs. snow (Heller & Co., Chicago, Ill.), 5 ozs. citric acid solution, 1 lb. acid dissolved in a quart of water.

This gives a good smooth body but our trouble is when making orange sherbet to incorporate the flavor and color so it does not separate and come to the surface, as oil, when left in the hardening room with a temperature of zero to ten above.

The 5c Eskimo Pie Now a Money-Making Sensation

Gigantic Summer Demand Paving the Way for a Huge Gallonage Output

The Eskimo Pie Cutting and Dipping Machine

Makes it possible to manufacture the 5c pie at a net cost of 20c a dozen, including license, wrappers, labor and material.

Not only reduces labor cost to less than 1c a dozen but eliminates all loss of chocolate and cream. All pies are exact in size and shape—no small wasted ends. By using our formula we guarantee a better coating obtained at a cost not to exceed 5c per doz.

Manufacturers
Morris Illinois

Can you tell us the reason for this? The sugar is mixed with cold water and the snow added mixed in part of the sugar and left to thicken before freezing.

Reply: I have analyzed the mix as given in your letter and you will find the data given below in table No. 1:

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
1000 lbs. 3½ % milk.....	35.00	85.9	120.9
150 lbs. 82 % butter.....	123.00	123.0
24 lbs. skim milk powder...	22.8	22.8
180 lbs. cane sugar.....	171.0
10 lbs. gelatine.....	9.5
25 lbs. water.....
3 lbs. meloine.....	2.85
17 lbs. water.....
8 lbs. vanilla.....	1.20
1417 lbs. mix.	158.0	108.7	451.25
Per cent	11.15 %	7.67 %	31.1 %
Per cent sugar, 12.69; gelatine, .7.			

You will notice that you have a little better than 11 per cent fat and 31 per cent total solids. You will also notice that your sugar content is about 12.5 per cent. This mix could, of course, be improved by increasing the serum solids so that the total milk solids would be at least 20 per cent. This would then also increase the total solids. You could also increase the sugar content some as a great many factories are now again using 13 to 14 per cent sugar. The reason you probably are not getting the yield you ought to is because your mix is a little low in total solids and also because it may be that it is not aged long enough. A mix ought to be aged at least thirty-six hours, and better forty-eight hours, to get a good, smooth cream and the maximum overrun.

I noticed that you are also using meloine as a ripener. As far as I am personally concerned, if I was operating a factory, I would probably use very little of the ripeners, fillers, etc., but would probably use gelatine straight.

I am suggesting in table No. 2 a 900 pound mix containing 12 per cent butterfat which is probably what you would want to answer to your formula for the Iowa state law.

Table 2.

Ingredients	Fat	Serum Sol.	Total Sol.
900 lb. or 100 gallons of mix—12 % fat, 8 % serum solids.			
117.0 lbs. sugar.....	111.10
4.5 lbs. gelatine.....	4.30
20.0 lbs. skim milk powder..	19.00	19.00
106.0 lbs. 82 % butter.....	86.92	86.92
652.5 lbs. 3½ % milk.....	22.82	56.00	78.82
900.0 lbs.	109.74	75.00	300.14
Per cent	12.09	8.3	33.35

Relative to the matter of making your sherbet, there is nothing wrong with your formula except that in making an orange sherbet you are using a flavoring extract which is pretty oily and is unsatisfactory. An orange sherbet is probably the hardest one to make due to the unsatisfactory flavoring material. You are also probably not hardening the sherbet fast enough. A sherbet needs a much lower temperature cold storage room than ice cream, and many experiments have been made to show that unless you can have a temperature from zero to 10 degrees below you cannot harden a sherbet satisfactorily.

If you want a manager, superintendent, expert, chemist, bacteriologist, operator, pasteurizer man, or help of any kind, "The Ice Cream Review" can help you find the best available man. If you want a position, "The Ice Cream Review" can help you as it has helped hundreds of others to secure a good position.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

When You

Choose a Cabinet

Consider Its Tank

As every ice cream manufacturer knows, but so often overlooks, the tank determines the cabinet's length of useful service. In fact, it is the very life of any cabinet.

Why the **TIFFANY** so far Excels Other Cabinets

Formed of No. 19 gauge pure sheet iron, tanks that go into TIFFANY cabinets are oxy-acetylene welded at the joints, which in itself forms a reinforced joint more than twice the thickness of the iron. The spud that receives the drain pipe is welded directly to the tank. Upon completion, the tank is thoroughly cleaned, pickled and galvanized by the hot-dip process—the best process known.

Corner Post Construction

*The Tank is only one of the many superior features of the **TIFFANY** CABINET.*

All sides of the case, for instance, are made of three thicknesses of veneer glued with special waterproof glue. Here you have three layers of wood sealed airtight with two layers of hot glue. The outside layer is one piece so that there can be no warping or opening of the joints as in cabinets made with one thickness of wood glued together on edge.

Corner posts are mortised to receive sides which are glued into them well nailed. Bottoms of legs are fitted with steel gliders so that the cases are very easy to handle.

Section through Cork Wall

Every ice cream manufacturer should read our carefully compiled booklet on cabinets. Free upon request.

A CABINET IS AS GOOD AS ITS TANK

The Place Ice Cream Should Occupy

(Continued from page 18)

To return to a further discussion of the place which ice cream should occupy, permit me to quote from the president of the National Association of Ice Cream Manufacturers, Mr. Charles G. Morris, as follows:

"Health, wealth and happiness, the gifts of the gods, long sought by mortals in vain, attend our industry. For, as with most of the best things of life, it is rather what you give than what you get that makes for success. So again, ice cream gives health, wealth and happiness to the consumer. Ice cream carries everywhere the health that comes from the use of simple foods well balanced not only in essentials of nutrition, but also in those recently discovered essentials of life itself, the milk-borne vitamins. Ice cream gives wealth to the consumers, since every device that will insure a better product or a lessened cost is eagerly in demand among us manufacturers. Ice cream gives happiness to the consumers—need I go into the details? We all know them from the happiness we experience in consuming our own products."

Dr. E. V. McCollum of Johns Hopkins University who is now without doubt recognized as the leading dietetic chemist in the United States, is quoted as follows in the Ice Cream Review:

"Ice cream one of milk's products is a food which the public has not yet learned to appreciate. They have considered it a luxury and not a real food. This is an error. Ice cream is a nourishing food, very palatable and high in food value.

"It is not necessary to load the stomach with heavy, bulky foods in order to furnish proper nourishment for the body.

"Ice cream is a food which is all digestible. During the war it was declared by the government to be an essential and highly nourishing food. Food experts tell us that one quart of ice cream furnishes as much nourishment for the body as 14 eggs. Ice cream should be eaten in every house hold in America. Let a dish of ice cream take the place of some other food, less desirable, less nutritious and more expensive. It should be considered as part of the meal. A dish of ice cream every day will mean greater health, strength and vitality. Remember it is an all-the-year-round food."

When the American consumer is made to realize the truth of the statements herein presented by one great man vitally interested in the ice cream industry and another equally vitally interested in the correct nourishment of the human race, the slogan of "Eat a Plate of Ice Cream a Day" would be a matter of the past. We would not be concerning ourselves over the fact as presented by Mr. Munn, president of the National Dairy Council, in an address approximately one year ago that in actually analyzing the consumption of ice cream, the American public are using only one dish of ice cream daily during sixty-six days of the year, leaving 300 days ice-creamless, not from appeal as was made for meatless and heatless days of the war, but for lack of concerted appeal to the buyer of America's food supply.

Before the last annual convention of the National Association Mr. F. N. Martin of Spokane Washington said:

"I can conceive that a brand of ice cream can be so extensively and so well advertised that the couple or party seeking refreshment at a fountain will look for a sign announcing the sale of their favorite brand. But to expect them to specify and insist upon it is foolish. 'It isn't being done' and won't be to any extent re-

gardless of how much or how well any of us may advertise. It follows, therefore, that so far as inducing people to ask for a specific brand of ice cream, we must all focus our efforts more particularly upon the home consumption demand.

"It is my opinion that advertising intended to develop a more habitual use and demand can best be done through general educational campaigns. But such campaigns, to be most effective must be supported by local campaigns of those having a community of interest. And such local campaigns featuring certain dealers should be supplemented by campaigns of individual makers reminding the public of their distinctive brands and their merits.

"I realize that many of us may not now or for some time to come feel inclined to enter into any extensive and cohesive plan of action, but that does not change the fact that it is fundamentally sound. I need merely refer to the healthfulness, wholesomeness, palatableness and nutritiveness of ice cream as some of the points of advantage in its favor which should be stressed in such community campaigns."

To accomplish just what Mr. Martin proposes, to accomplish what has been done by co-operative work, "Community campaigns" for the milk and the butter industries, which we must admit is still in its infancy, is a service which can be rendered to the ice cream industry of any state by and through the National Dairy Council.

Educational propaganda or publicity telling broadly the story of foods, health, child development, etc., have been a great factor in keeping consumption of milk apace with production, and consumption ahead of production in the butter industry during the year 1922 in spite of the fact that the largest production of each of these products took place during that period.

Public schools through their teachers, Red Cross nurses, home demonstration agents, educational and health agencies and other organizations are co-operating with the National Dairy Council in presenting this educational health and diet propaganda. The ice cream industry producing a product which we shall no longer consider a luxury but an essential food for health can corollate with this and by concerted effort put ice cream on every table every day which is the position in the American diet it should occupy.

IOWA MANUFACTURERS BUSY ON "FOURTH."

Approximately 10,000 gallons of ice cream was delivered to dealers in Mason City, Clear Lake, and all points in northern Iowa by manufacturers of the frozen sweet for July Fourth use. At one factory more than 5,000 gallons of ice cream was manufactured in addition to the regular run of many hundreds of gallons each day. At another factory the auxiliary supply was about 3,000 gallons.

TIMES HAVE CHANGED.

A magazine recently reproduced the items of an expense account submitted by a salesman some 15 or 20 years ago. Here are some of the items: Hotel (this includes meals), \$2.50; baggage and bus, 75c; postage, 4c. Day's grand total, \$3.29.

PACIFIC MANUFACTURERS TO MEET AT VANCOUVER IN DECEMBER.

The Pacific Ice Cream Manufacturers' Association will hold its 1923 convention at Vancouver, B. C., Dec. 3, 4 and 5, according to recent announcement by Bert H. Walker, secretary. Selection of the Canadian city was made by the board of directors after considering an invitation to meet with the California and Southwestern States Ice Cream Manufacturers' Association at a place and date to be decided later. Owing to the distance, the association declined the invitation of President Alfred of the latter organization.

W. V. S. Robb is president of the Pacific Ice Cream Manufacturers' Association. In a circular, issued jointly by himself and Secretary Walker, it was declared that the 1923 convention 'should be the best we have every held,' pointing out that it would come after the World's Dairy Congress, the Dairy Show, and the ice cream exposition at Cleveland.

This will be the first time that the Pacific association has met in Canada.

Members are asked to notify the secretary of any suggestions they may have for the program or other arrangements. The following program suggestions have been made by the secretary:

"World's Dairy Congress—It's Influence on the Ice cream Industry."

"What Should We Learn from the National Conventions?"

"Stop, Look and Listen!"

"What the Ice Cream Industry Means to the Dairy Farmer."

"Legislation—State and National."

"Getting Your Product Over to the Public."

"Advertising—Should It Be Local or General?"

"Trade Abuses—Their Relation to Competition."

"Co-operation Between Manufacturer and Dealer."

"Packaged Ice Cream—Does It Justify Paying Premiums?"

"Your Plant and Its Possibilities."

"The Ice Cream Mix, the Mix, and Results Desired."

"Plant Administration and Uniform Cost Accounting."

"Your Equipment, Its Care and Protection."

"The Future of the Industry—The End to be Accomplished."

"Has the President Anything to Say?"

NEW PLANT AT NEVADA, MISSOURI.

The Nevada Milk Products Co. recently completed its new plant. It is modern throughout and includes milk pasteurizers and cream vats, churns and all other necessary equipment for the making of butter, ice cream and pasteurizing milk.

The company maintains its own refrigeration and cold storage units. According to C. E. Driver, president of the firm, the daily capacity of the new plant is a thousand gallons of milk, five hundred gallons of ice cream, and about three thousand pounds of butter. It is not operating to full capacity this season, though the outlook for the future is encouraging, officials say.

BUSINESS GOOD IN OKLAHOMA.

J. B. Porter, Secretary, Oklahoma Association of Ice Cream Manufacturers, writes us under date of July 6th as follows:

"The peak of the season is here again, and from reports as gathered Oklahoma manufacturers have nothing to complain of at present. Weather for the Fourth was ideal and capacity business general. Heavy rains and over-flowing streams delayed the season several weeks and did enormous damage in some parts of the state but is soon forgotten."

ICE CREAM LEGISLATION

By E. H. Golaz, Austin, Texas

(Continued from July issue)

I want to get your attention just for a few minutes on a very trying subject, and that is the subject of Ice Cream Legislation. I represent what is known as The Food and Drug Department of the State of Texas, and our function is to enforce the laws as handed down to us by the legislature.

It has been said, probably with good reason, that we are suffering from an excess of laws; that our statute books are blackened with many useless unenforceable regulations; that we are over legislated and over regulated. Many laws seem cumbersome and useless, and our much cherished liberties are reduced to a minimum. We have laws that tell us when to work, when to play, and what to drink—especially what not to drink and what to eat. The milk industry has seemingly been surrounded by a mass of such regulations. So much so that I frequently ask myself if the thing is overdone and what would happen to the producer and consumer if the bars were let down and matters allowed to adjust themselves without interference.

Anyway, when it comes to the manufacture of ice cream, practically every state of the Union has seen fit to define the word "ice cream," to establish a butterfat standard, to limit the amount of filler, and in some instances to establish a ration of weight to volume.

10 states have a butterfat percentage of 10 per cent or above.

18 states have a butterfat percentage of 8 per cent.
4 states have a butterfat percentage of less than 8 per cent.

8 states have a filler or binder percentage of 1 per cent.

8 states have a filler or binder percentage of 0.8-0.5 per cent.

The others have a percentage of below 0.5; or do not specify the percentage and use the very elastic words of "customary substance."

4 states require compulsory pasteurization.

2 states establish a net weight of 4 pounds.

1 state—Kansas—a net weight of 4¾ pounds.

Texas, as you know, has established a butterfat standard of 8 per cent and a limit on harmless filler or binder of 0.2 per cent. During the last legislature an attempt was made to pass an ice cream law requiring compulsory pasteurization, defining the word ice cream as a product made in whole of milk products, legalizing the 8 per cent butterfat standard. The state board of health was in hearty accord with the proposed law, and did its best to secure its passage. It passed the house, and finally failed by a small majority in the senate.

I understand that the great majority of the Texas ice cream manufacturers are still in favor of the proposed law, and intend to renew their effort of two years ago. In this connection I would propose that to the definition of the word ice cream the amount of permissible filler or binder be raised to one per cent and that a net weight of 4 pounds be adopted, allowing a "swell" of practically 100 per cent.

I simply make this statement because the figures that I gave you were taken from 1921. Since 1921 and during the past year there are now over fifteen states which have now on their statute books, or in contemplation of passage, similar laws, and it occurred to me that if the thing is to come one way or another it might be best to come from your hands than from some outsider.

And now to revert to my first proposition of an excess of special legislation. I wish to impress upon you the idea that such a law is not an increased burden to your industry, but an actual safeguard.

It is not a fact that the bars could be let down and matters allowed to adjust themselves to the laws of offer or demand. It is not a fact that the consuming public can be the only judge of your products. Without legal definition of the word "ice cream," a general scramble towards cheaper products would take place and the selling price become the only factor controlling the manufacture and sale of ice cream. In adopting a reasonable standard you are really not protecting so much the public as yourself.

The department I represent is daily in receipt of numerous questions, asking our opinion on formula of products intended to be sold under various names, but probably intended to rely upon their ice cream appearance to make their sale possible and profitable. One of these—frozen pies or frozen custards, showed upon analysis practically 50 per cent of starch material.

We have taken the attitude that, independent of names, such articles would be offered for sale as imita-

tions of ice cream and therefore be illegal, but to enforce the law as we understand it, we must know what, legally, ice cream is.

A review of the many cases submitted to the courts of the different states, without specific law on the subject, but relying upon administrative regulations and charging misbranding or adulteration on account of deficient butterfat, shows that the proposed ice cream law is not only desirable but necessary. In this state, in cases based in whole on non-conformity to a department ruling, it is necessary not merely to plead deviation from the standard, but also to produce evidence of trade customs in conformity to the standard.

In this matter, like in any other matter affecting one of our industries, the State Food and Drug Department wishes the advice and help of your association, and feels certain that your decision will be fair, both to the manufacturer and to the public.

I purposely read this paper because it contains some figures and some statements that I wanted to be able to state a little more correctly than in an off-handed talk. But the proposition is simply this: While we have been attempting in the past, from our point of view, to enforce the standard as to what ice cream ought to be—it has been entirely upon rules and regulations. These rules and regulations can be questioned; are questioned; they have probably no force in law. The only thing we can state is, that it is the common practice, a trade custom, we have to show that. If you think it is worth while I strongly would urge that you get together in an effort to pass a law, framed by your own people, and submit it to the legislature. I believe it is really a matter of self protection for you to do this. As you all remember two years ago the matter was up in the legislature. First, there was the question of pas-

teurization, and most of you are fully acquainted with that, and, of course, we are in favor of that. You will remember that at the last moment we were compelled to make some concessions. It was found that in the legislature there was a strong sentiment against general pasteurization. The question was raised that the pasteurization was made for the purpose of putting the small man out of business and allowing the big manufacturer to reap the harvest. In order to correct this impression we then took this attitude, that small dealers—I don't remember exactly the figures, but something like twenty-five gallons or less daily, would be exempted from this part of the law, that is, pasteurization, provided, however, they would pass an inspection by our inspectors, and that would give us this latitude that places that were absolutely unfit—and there are many of them in this state—could be put aside—closed. As it is today—without this law—we have nothing but the finished product to bring in court; we have no jurisdiction over the place where it is produced. I really believe this small exemption to the general purpose of the law will not in any way decrease its value. The legislature meets now within a few days, meets on the second Tuesday in January. I want to lay before you association this proposition: If you think it is worth while to take up the matter in view of the past experience and in view of the fact that the personnel of the legislature has changed to a large extent—there being over ninety new members, it would be well for you amongst yourselves, to decide what you want—whether you really want to try to secure the passage of this law. If you do decide to undertake the passage of this law I can promise the complete help of my department, both personally and through others—you can rest assured we will do our share. I don't believe there will be, with the amendment I mentioned, much objection to it.

The question of ice cream—the attitude that was taken against it from other competitors, was discussed by me at length in Kansas City at the general meeting of all the food commissioners of the United States. The question came up—it came up in regard to the very wonderful success of the Eskimo Pie. In other words, is it possible for a product to be sold as ice cream and escape the definition of the words "ice cream" and to standard of ice cream simply by changing the word. Upon this point there was a complete consensus of opinion from the side of the federal department that they would absolutely disregard the name, and that the only question that would be in their minds is the impression which is carried on to the public regardless of the name. Now, I don't want to make a suggestion, but I think the time is pretty close to get busy. I might possibly suggest that a small committee of two or three members, selected amongst yourselves, be appointed—if you decide to take up this matter, and let these members be in charge of the bill and see that it is properly handled. (Applause.)

* * *

President Sullivan: Is there anyone here that desires to ask Mr. Golaz any questions?

Mr. Boedecker: Yes, sir. I don't know whether this is pertinent, or whether I should ask it or not. Would you rather not answer it at this time it will be all right. In passing upon this "Rice Cream" which was discussed here today, would that be judged as butterfat the same as other ice cream should, or should this Rice Ice Cream or Rice Cream, as you call it, have to come under the law of eight per cent, or would it come under six per cent, as we understand it is made.

Mr. Golaz: It is a little embarrassing when you select one special product, and it is a little embarrassing

to speak about it, but in a general way that is exactly the main purpose that I have been trying to make clear, that a standard ice cream be made and insisted upon by you people, not so much as a safeguard to the public but for your own protection. In urging a reasonable standard to which you have given a definition to the words "ice cream" you are absolutely restricted then—restricting this business to this definition, and nothing else; the law is specific. Whether or not the product would escape the law in changing the word is just what I have been trying to make clear; I am under the impression it would not. But maybe, as far as your question goes, it may not, as I understand it is not sold as ice cream but rice cream. It might be well, in this special case, to state that the word "ice" includes the word "rice" and let the courts rule on it. I wanted to make our position perfectly clear, that we will not take into consideration the wording of the thing but only the general impression as carried to the public.

Mr. Boedecker: Let me make myself plain. I don't mean to say I am against rice cream, but what I am trying to get at is whether it would be judged as plain ice cream, or whether it could be worked in on the order of chocolate ice cream or fruit ice cream.

Mr. Golaz: I believe under the general principle it would not be ice cream.

Mr. Campbell: Professor Golaz, the bill you mentioned, is that just a general pasteurization bill or does it just define all the dairy products that enter into the manufacture of ice cream?

Mr. Golaz: No, sir; I have the bill; the bill has been drawn—that is, the last one, and, as I remember it, it covered practically the pasteurization of ice cream and the general pasteurization of the mix; however, I am not sure.

Secretary White: Yes, sir, that was the intention of the bill—to cover the pasteurization of the mix prior to freezing.

Mr. Campbell: The reason I asked, I am from Louisiana, and we are framing a bill to present to our legislature, and I just asked for information.

Secretary White: I have a copy of the proposed bill down at my office, and I will be very glad to give it to you.

Mr. Campbell: I would be very glad indeed to get a copy.

Mr. Boedecker: Mr. President, It seems to me we need a committee to work with Doctor Golaz. We had a very good committee before, and I move that the committee be reappointed for this coming session of the legislature.

Mr. Pangburn: I second the motion.

President Sullivan: It has been moved and seconded that the same committee that previously had this bill in charge be again appointed. All in favor of that will signify by saying aye. (Chorus of ayes.) Contrary minded? (No response.) The motion is adopted.

President Sullivan: The next thing on the program is Mr. W. W. Campbell, president, Southern Association of Ice Cream Manufacturers, on Advertising.

ADVERTISING

By W. W. Campbell, Shreveport, La.

Several years ago I attended my first ice cream convention in Texas. I there got the bug, and I have been a regular attendant at all conventions. I consider it the best money that I have ever spent, and I obtain most valuable information for my business in being in attendance upon the conventions.

When your secretary, Mr. White, wrote me asking if I would prepare a paper on Advertising at this convention, I realized that there are quite a number of members of this Association better able to handle this subject than I, but I felt that if I could give you just one thought or suggestion that would be of assistance to you, I have done something to promote the industry and help my fellow workers.

Advertising is a method of inviting or urging the sale or exchange of property or service. While any effort to effect a sale or exchange is properly called advertising, the word is more commonly used in the

offer of merchandise for sale such as the advertising of goods by a manufacturer or merchant.

Some of the channels for this variety of publicity are: newspapers, billboards, magazines, electric signs, novelties, cut-outs, street cars, moving pictures and programs.

I am not going to attempt to tell you which form of advertising is the best, the majority of it is good, but what might be most effective in your section might not be effective in my section at all, so it is a matter for each manufacturer to decide which is best for him, but **ADVERTISE.**

At the beginning of the year I think you should budget your advertising and stay within your budget. Outline just how much you want to spend in each kind of advertising and spend it judiciously. As a general rule there are three classifications for merchandise. First, staple merchandise. Second, novelty merchandise. Third, stimulating merchandise. Stimulating merchandise is merchandise which brings people to the store. It is receiving more attention by modern storekeepers than the other two lines of merchandising. Department stores feature stimulating merchandise at a smaller margin of profit than is made on novelty and staple merchandise, because after the stimulating merchandise has brought a customer to the store, it is then hoped to sell that customer something from the staple or novelty merchandise.

Ice cream is the greatest stimulating merchandise there is, the dealer not only makes a good profit, but there is a daily turnover.

It is claimed by some merchants who have kept records that forty per cent of the people who come into their stores to buy ice cream purchase something else while in there. This, it seems to me, is a strong talking point for the salesman to point out to the dealer.

many advantages for the sale of ice cream other than the profit in the commodity.

We have all heard dealers say that we can't make a profit out of ice cream, it is because he hasn't kept a record, he really doesn't know whether he has or not, but when he dips from two hundred and eighty to three hundred 5c dips out of a five gallon packer of ice cream that cost him six dollars and twenty-five cents, he hasn't lost any money, so it behooves the manufacturers to point out to him these facts and in place of having a dealer who handles ice cream just because his competitor down the street handles it, you will have a customer who is pushing ice cream in place of bottle goods that bear a less profit.

This form of advertising is a part of the service that goes with advertising ice cream. Ice cream has been on the market such a long time that it is universally known, but it is only in the last few years that it has come into its own, with the advent of new ideas, new methods, improved machinery, new systems, through advertising we have been able to point out to the consuming public the great food value of ice cream.

The consumption has increased from less than one gallon per capita a few years ago to an average, the country over, of 2½ gallons per capita and in some thickly populated centers to seven gallons per capita. This, my friends, is the result of following that great rule, "Truth in Advertising." Advertise, but back your advertising with quality which is Truth. I thank you. (Applause.)

* * *

President Sullivan: I would like to have some discussion on Mr. Campbell's paper. Mr. Pangburn.

Mr. Pangburn: Mr. President, I don't know that I could add anything to Mr. Campbell's paper. I think that idea is one we should carry home with us, and that

is, we should stress more the food value of our product in advertising ice cream. It calls to my mind my experience in working behind the soda fountain several years ago. When I first started working behind the soda fountain, I remember, at that time, if one man would come in and catch another man partaking of a beverage at a soda fountain it was generally considered a joke, and he made apologies for taking a drink at the fountain. That thing has changed to a very great extent, but there is still more room for improvement. If we can bring about in our advertisement something to impress upon the minds of the public that when they go to the fountain, instead of spending their money for some drink that merely tastes good and has a good food value, and that it is beneficial to the digestive organs instead of being harmful, why, we have accomplished a great deal. There is no doubt in the minds of those who have made a study of this product that we have, and as has been brought out here today, that it is not one of the best but the best food product known. That is the thing we should give more thought, and I would be very glad indeed to hear some more discussion along this line, and by some that could advance better ideas than I could.

Mr. Wren: Mr. President, that brings to my mind a thought I am going to leave with this convention. We have heard a whole lot, a great deal, and a great many times about the food value of ice cream. It has got a wonderful food value. But how many of us have really stopped and sat down and figured out in our own mind just exactly what that means? I mean by that just simply this, that ice cream is a product of milk, and milk is the only food provided by nature that contains every element in its regular proportion that is capable and able to sustain and nourish the human body from the time it is born until the time it dies. There is nothing like it. There is no element of milk that carries an excess of one ingredient and lacks another. It is not necessary to fully analyze milk, but we know that average milk—if milk is a perfectly balanced ration—which it is, we know that milk contains four per cent of fat, approximately eight per cent of non-fat, about five per cent of sugar, and the other ingredients that go to make up the composition of milk in its detail. If that is a perfectly balanced ration, a perfect food for all man kind, do we pay any attention to that formula in the manufacture of ice cream? If ice cream is a food it should be the best food, and if it is the best food we should pay attention to these different percentages of the product when it enters into this frozen product. For instance, we all know we can't manufacture ice cream out of four per cent milk; that is impossible, but when we add fat to our mix—if we don't add the other elements in the same proportion to keep the ration properly balanced we have an unbalanced food ration, and naturally it is not going to be properly digested by some people. The average adult could handle it very safely, no doubt, but ice cream is consumed by everybody. You have often heard, every one of you, people say that ice cream didn't agree with them. Perhaps it doesn't agree with them. If I manufacture ice cream that contains ten per cent fat and about fifteen per cent non-fat solids, I have got a ration that may unbalance somebody's stomach—it has got a right to, it is improper—it isn't properly balanced. On the other hand, if I have about thirty-five or forty per cent of total solids and about six or seven per cent of fat, it is also unbalanced. I just wonder—and I will pass it on to you, just wonder how many have really sat down and figured that thing out? I believe it is worth while to go out and tell Mr. General Public that ice cream is a food; I think it is proper for us to know

The Homogenizing Valve on the Gaulin is so constructed of a combination of semi-precious metals that it will give months of service without any attention whatever. There are cases on record where these valves have been in continuous service for 18 months and today show no evidence of requiring grinding.

The bronze bearings and connecting rods on the Gaulin are amply proportioned and will give a lifetime of service. The gears are of semi-steel (no rawhide or other semi-permanent material), are totally enclosed, and run in an oil bath. The chain on the motor equipped unit is also totally enclosed and running in oil. Compare this construction with that of other machines sold to do the same work and draw your own conclusions.

Considering the care taken in the selection of materials and in the machining of each individual part and on top of this the thorough testing to which each Homogenizer is subjected it is not to be wondered at that the Gaulin is the long lived machine it is.

There is a place for a Gaulin in your plant whether you make ice cream, chocolated milk drinks, cottage cheese, Jewish sour cream or any one of a dozen different dairy products. May we not advise you?

that it is a food and the right kind of a food, and that it represents, insofar as it is possible, the very same percentage of different matters that is contained in the original product from which it is manufactured, I think we should know that when we tell Mr. General Public about it. I just give you that thought because it came to me when these papers were being read and this discussion and reference to ice cream as a food. I think it is something worth while thinking about. (Applause.)

Mr. Zimmer: Outside of a few individuals and babies, how many people do you believe eat ice cream because it is a food?

Mr. Wren: Everybody.

Mr. Boedecker: I believe we in Dallas have advertised ice cream as a food more than probably—more consistent than any other ice cream plant in that section of the territory. It has not only happened to me once but it has happened to me a hundred of times, that friends of mine have told me about having ice cream at home, and invariably they will say, "You know that is a good food. I get it three or four times a week." For two years we have run one little ad daily in the paper, and it only contained from four to ten words, stressing ice cream as a food. In Dallas they are commencing to figure ice cream as a food. Some ten years ago Riegler and Klein in San Antonio were selling more ice cream to their customers in San Antonio than we were in Dallas, but I think the thing is reversed now. I think we sell more ice cream in Dallas per capita than is sold in San Antonio, because we stress that one feature.

Mr. Zimmer: I would like to hear that subject discussed in regard to advertising in the winter time instead of the summer.

Mr. Carrithers: I feel this way about advertising in the winter time. In everything you try to do, if you are going to make a sale, or make a get away, there is a psychological moment, and at that time—when that time comes it is like the blacksmith welding his iron, there is no use to put a piece of iron in the fire and get it red hot and then take it out and wait until it cools and then hammer on it. There is a time to do this, when the psychological moment comes do your big advertising, your heavy advertising, when everybody is

thinking about ice cream, so right in and pour it or them right then; get them started to eating it. We are just a bundle of habits anyhow. We get in the habit of eating ice cream right at the time when everything—your whole system is crying for ice cream, something cool, something cool. I remember a few years back when every manufacturer assembled here today was just wondering all the time how he was going to get by, but now it isn't that at all, he has doubled and trebled his output, and some times it is two or three hundred per cent over what it was ten or fifteen years ago. It isn't because he has advertised so much, anything of that kind, but just because the people have formed that habit.

There is a great deal of difference in the food value in ice cream and eating an equal amount of food value in a beef steak, one is a job and the other is a pleasure (Laughter and applause.) Bear down on the advertising and you will find that the people will come your way.

Secretary White: Gentlemen, it is five o'clock, and we have to make room for this banquet tonight which will be held in this room. Tomorrow Professor Bae will make us a talk, and I hope every one of you will be here, you should not miss it. A motion is now in order to adjourn.

Mr. Pangburn: I move that we adjourn until tomorrow.

Mr. Wren: I second the motion.

President Sullivan: It has been moved and seconded that we adjourn until tomorrow. All in favor of that motion let it be known by saying aye. (Chorus of ayes.)

(The convention at 5:00 o'clock p. m., adjourned until 2:00 o'clock p. m., December 14, 1922.)

* * *

THIRD SESSION.

Thursday Afternoon, December 14, 1922.—2 P. M.

President Sullivan in the chair.

President Sullivan: Come to order, gentlemen. The first thing on the program is "Purifying Quality of Our Milk Supply" by J. W. Ridgeway, formerly with the A. & M. College.

* * *

PURIFYING QUALITY OF OUR MILK SUPPLY

By Prof. J. W. Ridgeway

MY REMARKS on this subject will be largely introductory, will deal principally in generalities, because, if you will notice on the program there are two parties who are to discuss this subject. Usually when a situation of that kind arises, when there are two people on the program to discuss the same subject, the one that speaks first is supposed to be very brief. As a matter of fact, one of the best qualifications for a speaker at an ice cream manufacturers convention—you might say there are three qualifications: One is for him to stand so he can be seen, and the other is for him to shut-up so he can be appreciated. I will be rather brief on the subject we have in mind. Now, the purifying quality of our milk supply is of great importance to the manufacturers of ice cream. I am not going to say so much about the improving of the quality of the milk supply as I am going to bring out some salient points with reference to the improving of the quality of all dairy products. I don't think we can congratulate ourselves yet that we have reached the zenith of perfection in the matter of turning out the highest pos-

sible quality of dairy products. There is considerable room for improvement in the matter of quality. Now I don't know whether we can go further and congratulate ourselves that we have reached perfection in the matter of manufacturing. The quality of the product is to be determined by the quality of the raw material which enter into that product, and further, the method of manufacture involved in order to put it out. But I do believe that the methods of manufacture have advanced more rapidly probably than the methods involved in the production of the raw material. So that the big things that probably enter into the improvement in the quality of our Texas dairy products is the matter of the improvement of the raw material which enter therein.

Again, in discussing that subject briefly, I want to say there are two channels open for the matter of improvement, and I am going to divide those into two parts, one from the standpoint of education and one from the standpoint of legislation. Regardless of what legislative measures you might put through, unless you

Five Million Homes and Heathization!

HERE is a miniature reproduction of one of the full page advertisements we have prepared for our big National Publicity Campaign. A series of unusual and interesting messages telling the STORY OF HEATHIZED ICE CREAM will appear during the months of JUNE, JULY and AUGUST. Thirty-seven leading magazines including such publications as Hearst's—Munsey's—Vogue—Vanity Fair—Harper's Bazaar—Outlook—Colliers—McClure's—Christian Herald—Sunset—American Cookery—Life—Judge—Metropolitan—Physical Culture—Country Life and Classic will publish these messages which will be seen by more than *five million families*.

THIS is only part of the service we render to Heathizers. An ice cream manufacturer licensed under the Heath Patents gets something more than the right to make a better ice cream. We furnish him with merchandising plans that are tried and true. We supply him with advertising material, dealer helps, sales letters, etc. We keep men in the field constantly to assist our clients in developing their business. We gladly render them, free of charge, expert advice in the solution of their manufacturing problems.

Write for Our Plan!

You want to make more money. We will show you how to do it. Look into Heathization today and learn what others are doing. This is an opportunity you will grasp when you know the facts. Write us at address below.

Heathized Products Company

have public sentiment built around that legislation, which public sentiment must come from educational methods, I don't believe your legislation will be a success. Now, under education I want to charge the manufacturers and distributors of dairy products with this fact. Had it ever occurred to you that dairy products are the only commodities that are bought without a basis of grade. Now the farmer takes food in the market and it is sold on a basis of grade; takes cotton to the market and it is sold on the basis of staple, but there has been no differential allowed the farmer in the matter of the quality of his dairy products. In other words, no incentive has been given to the farmer to take the pains and precaution necessary for the improvement of the quality. That is a thing that you, as manufacturers, ought to think about, ought to give serious consideration, because in education—therein lies the biggest field, because one of the best ways in the world to educate a fellow to do a thing is to pay him for doing it right. Now, of course, we have various methods of educating men in the matter of products—high quality dairy products; we have different institutions; we have our agricultural college, our universities, we have our boards, all of which should be combined in some central course to bring about more educational methods in the matter of improving quality. Then, for instance, this point—you take for instance in the matter of producing high grade milk—a high grade quality of milk. It is generally thought by the producer that he must be pretty well equipped with these modern devices, such as concrete floors and so on—yet they are well worth while in the matter of serving efficiently in the production of milk. It has been proven pretty con-

clusively that they are not absolutely necessary in the production of a high quality of milk; in other words, the method counts for a great deal more than this equipment in the matter of producing a high grade milk.

I am told by the central office in Dallas, as an illustration, that the man that last year had the least bacteria count—made the best record in the matter of bacteria count for his milk, milked his cows on a dirt floor and had no up-to-date equipment other than a pretty good shed, but he observed those essentials which are necessary for the production of a high grade milk. He had his cows clean; he sterilized his utensils, and so on. So, in this educational move, I think that point should be emphasized—it is not an instruction proposition to produce clean dairy products, it is largely a matter of a proper application of elbow grease. So any educational course along that line, that point, will be worth while.

Now, in the matter of legislation. There are several things which we need to help improve the quality of the product regardless of the precautions which are observed in the production of milk. I think there is one thing we need more in this state to bring about a general improvement in the quality than anything else. We have already made some advancement in building up in favor of that one thing. Of course, you know what I have reference to, and that is universal pasteurization—universal pasteurization act, which is largely a matter of legislation. I think in time we will have sufficient interest built up through additional propaganda by which we can put over universal pasteurization acts in our more progressive states.

Now, Mr. MacGillivray, who is to follow me on this program, has something specific along the lines of what we are doing to assist our producers in the improvement of the quality of milk, and I don't want to take up any more of your time on this particular matter, as he has something tangible, something specific.

In conclusion, I do want to make this observation, and that is in regard to the spirit of co-operation which was brought out so forcibly yesterday by the pastor who addressed us. We want to do something for each other; we want to pull together for the development of the industry, and when you get a bunch of men together that are as intelligent as the members of this association are—inbued with the idea of service for their industry, we will all show a wholesome surplus. I feel duly gratified over the convention. We have had a good time socially; we have had good business ses-

sions, and I believe we will all go away from here feeling that we had a convention that was worth while. (Applause.)

President Sullivan: Mr. W. C. MacGillivray, of San Antonio, Texas, will now address you on the Purifying Quality of Our Milk Supply.

PURIFYING QUALITY OF OUR MILK SUPPLY

By W. C. MacGillivray, San Antonio, Texas

WE HAVE some of the equipment that we use in our dairy work—and if you would like to inspect them closely you are at liberty to do so.

I have here some tests of milk that came to our plant. I would like for you to look at them, as it shows in a general way the milk as it comes to the average plant. (The equipment used by Mr. MacGillivray was furnished by the Mistletoe Creameries, San Antonio, Texas, and operated by two of the employees.)

Getting a pure milk supply has been one of the ice cream manufacturers many troubles. It really does not make any difference whether he is a large manufacturer or a small one, the big question which confronts him today is, "How can I improve my milk supply?" Our health officers and sanitarians have for many years been devoting most of their time to getting a better milk supply. The increasing demand for ice cream as a food alone has justified every effort put forth.

In the past, little attention was given to milk, other than to see whether water and preservations had been added, but today with the development of the science of bacteria, there has arisen a new and most important consideration concerning milk. Pure milk can no longer be judged by its fat and solids content even though it is free from harmful chemicals, it must be further subjected to a test for bacterial contamination.

Steam Jacketed Copper Kettles

Whatever your requirements may be in steam jacketed Copper kettles, we are in a position to supply you. Ideal for every kind of mixing, melting, boiling and cooking requirements.

Fifty-two years of specialized experience in manufacturing kettles to the trade assures you of the maximum of satisfaction in design, materials, and workmanship.

Bacterial contamination can and does convey pathogenic bacteria, such as typhoid, diphtheria, septic sore throat, scarlet fever, tuberculosis and many others; fortunately, however, most of the bacteria found in milk are not of this type, but are the bacteria associated with dirt. They come from the barn yards, dirty cows, dusty stables, dirty hands, unclean milk pails, coolers, and cans, carelessness with the handlers enroute to a central point or to a centralizing plant.

The process of producing and selling milk is a series of steps, each step is a distinct and separate operation, starting at the farm a great deal of educational work can and must be done. The dairy farmer will do his part if he is approached in the right way. Milk as it is delivered at some plants today is inspected in the following manner; Lid is removed and it is tested by small for foreign odors. Should any be detected it is tasted to see if it is sour or turned; a sample is taken for butterfat test, as most milk is bought on butterfat basis; the milk is then weighed and sent to receiving vats. No attention as a general rule is paid to the cleanliness of the milk, just so it passes through the strainers is sufficient. It is quite true that the argument is set forth that we have our modern clarifiers and filters and we concede that the foreign substance or the cause is removed, but the effect still remains. By effect, we mean the colonies of bacteria. The milk has been inoculated with the bacteria carried by the dirt; a separator, clarifier, filter or strainer will not remove these colonies of bacteria, nor will they destroy them. It is a proven fact that these processes break up the colonies and cause them to multiply more rapidly.

The average manufacturer is very particular about his vanilla, fruits, gelatine and fillers; by the time he gets to his butterfat supply his energy is pretty well spent, so when he gets to his milk supply—well, it just takes care of itself, and if nothing happens, all well and good, but when something does happen, which will sooner or later, it may prove to be disastrous. There is not a year that goes by that we do not have milk borne epidemics. Last year in the U. S. and Canada we had 330 outbreaks of epidemic diseases traced to milk alone, 195 of which were typhoid fever, 147 of these were traced to the dairy farms, 67 were traced

food for thought

THE man who increases quality builds for the future. His business rests upon a firm foundation which competition cannot undermine. He not only increases the public good-will toward his industry, but creates a firmer and greater demand for his product.

It has been our aim to manufacture a vanilla based on these principles. *Our product has always been made up to a standard, not down to a price.*

That this has been our "short cut" to success is demonstrated by the ever-increasing demand for

to contaminated water supply, 24 were traced to milker at the farm acting as nurses, and 10 were found to have started from disease carriers. When we remember that some of these epidemics are just little flurries, while others number hundreds of cases with many deaths, it is appalling the amount of mischief which is possible through the neglect or carelessness of one single person. It is quite true that 330 milk borne epidemics from the continent of North America covers a great deal of territory; however, we can never tell where the next outbreak will be. It may strike very close to home.

The ice cream industry is growing steadily; methods of manufacturing are greatly improved. Ice cream 10 years past was considered a luxury, today it is a most desirable food and has become a necessity; there is hardly a social gathering of any kind where refreshments are served that ice cream does not hold an important part. Our army camps demand that their ice cream come up to their requirements not only in fat and total solids but the bacteria must be under control.

Here in the south we have been really fortunate in having some of the best medical and sanitary officers in the United States army to work with us, teaching us their methods and the necessity of fighting the development of bacteria by keeping all of the equipment, as well as the premises, in a clean and sanitary condition. These same medical officers then went after our milk supply and, together with our own field men and dairy inspectors, we started to improve our milk supply. To do this, it was found necessary to induce the farmer to improve his method of producing. The results obtained far exceeded our expectations, as the farmer co-operated with us in every respect.

The work which has been accomplished during the past three years is really wonderful, for our milk supply is fully 100 per cent better than when we started. We have discovered that the bacteria in our ice cream is more easily controlled than it was before. It has become almost a habit with some of our producers to see who can produce the best milk; it used to be the man with the highest butterfat test had the best milk, but today the dairy farmer who has the cleanest milk and the lowest bacteria count is sure to get a better price than the one whose butterfat test is the same but the milk is dirty and high in bacteria. A great many of our patrons have a new feeling of responsibility, they are convinced they are giving the public a better food by selling their milk clean and pure.

The suggestions offered to the dairy farmer were such that caused him little or no extra expense. In this locality, the dust is very bad during the summer months, but by sprinkling just before milking time the dust was kept down. Most of our patrons wash the flanks and udders as well as dry them before they start to milk, three or four streams of the fore-milk are milked into a separate vessel before the milking properly starts. Drawing off the fore-milk greatly reduces the possibility of high bacteria in milk. The milk is then taken to the milk house for straining and cooling. A cone shaped cooler is used; although these coolers have been condemned by some authorities as being unsanitary, we find that any make of cooler is unsanitary if not properly washed and taken care of. The cone shaped cooler has many advantages; it is light in weight, has only two parts and is so constructed that it is easily taken apart and easily assembled, all joints are well soldered, and there are no cracks or crevices where bacteria could develop. By washing these coolers with a good washing powder and rinsing off with boiling water, it reduces the possible chance of contamination to a minimum. The center of these coolers

Study of Gelatine for Manufacture of Ice Cream

By E. H. PARFITT*

GELATINE has been used in the manufacture of ice cream for the past 40 years and I believe it is safe to say that 90 per cent of all ice cream manufactured on a large scale contains gelatine. The ice cream industry is the largest single consumer of gelatine, consuming somewhere near 8,000,000 pounds yearly. Because it is used so extensively and so much of it is used, the ice cream man should have a good conception of gelatine, what it is, how it acts, and some practical tests for its purity.

Even today many consumers of ice cream look with scorn on ice cream that contains gelatine and some manufacturers, I am told, are endeavoring to find a substitute, such as succinate of lime. In reading reports of state meetings that have been held by ice cream men, I have been interested to note the interest in gelatine displayed at these meetings. We have all come to the conclusion that we know little about gelatine as to its properties.

The manufacturers of gelatine have deemed it advisable to have much research done on gelatine and have installed a fellowship at the Mellon Institute. Some of the work done there has been published and they are continuing principally to study the food value of gelatine. We, here at Purdue, undertook to study gelatine, principally the gelatines as offered to the ice cream manufacturer. We have found some mighty interesting variations.

The first point I want to bring up is—what is gelatine? It is a simple protein, a typical colloid of the

emulsoid type and because of this fact finds use in ice cream manufacture. In color it is a light yellow transparent, flexible, horny and amorphous, containing when dry from 15 to 18 per cent of water. Little is known about the chemistry of gelatine as it affects the ice cream man, and facts which may be given today may be contradicted tomorrow.

Second point: How is gelatine made? Hide skins and green bone constitute the raw materials used in the manufacture of edible gelatine. This material is carefully selected and worked up immediately, care being taken to keep the bacterial content low, as well as favorable color and odor. As in the dairy the gelatine manufacturer must keep things clean and avoid metallic contamination as well as bacterial.

Function of Gelatine.

Third point: The function of gelatine in ice cream. Its presence in ice cream helps to prevent crystallization from separating in the form of large crystals. One manufacturer advertised that using his gelatine would tend to prevent sandiness. According to the work done in this department, the presence of gelatine in an ice cream mix in no way retarded the production of sand, but I do believe that gelatine has an effect upon the water crystals, keeping them small so as not to influence the smoothness to the taste of the finished product. Gelatine increases the viscosity of the mix. This viscosity relationship will be taken up in a later talk, but I wish to say that the ability of a gelatine to increase the viscosity is largely influenced by the jellying power of the gelatine in question.

Gelatine also helps in the incorporation of air in the mix and this is influenced by the jellying power of the gelatine. Gelatine according to "Bogue" constitutes an important addition to the food values of ice cream. It functions as true food but not a complete food. It helps to preserve the nitrogenous constituents of the body, aids in the digestion and assimilation of all the constituents of ice cream, especially the casein, preventing its coagulation in large lumps. From a dietary standpoint the presence of good gelatine in ice cream is very beneficial.

This brings us to the point of what is a good gelatine. In the experiment we are conducting here one of our aims was to determine what constituted a good gelatine, and the difference between good and bad gelatine.

* Of the Purdue Agricultural Experiment Station, in address before meeting of the Indiana Ice Cream Manufacturers' Association at Purdue.

JUDGE NOT LEST YE BE JUDGED—CUT NOT LEST YE BE CUT.

My definition of a good gelatine would be something like this. A good gelatine is a gelatine made from carefully selected, high quality materials, which has a high jelly point, less than $2\frac{1}{2}$ per cent, goes into solution and solidifies quickly, low percent of ash, clean, inoffensive odor, makes a clear, slightly straw colored solution, neutral or nearly neutral in reaction, low bacterial count (not to exceed 5,000 and no B coli types) and without chemical or physical impurities. Does the gelatine you are using conform to these standards, are you demanding of the manufacturer a gelatine conforming to these standards? We bought as many different gelatines as was possible on the open market, buying in five pound lots which would make a fairly representative sample. The price we paid varied from 50 cents to a dollar a pound. As these samples came in we put them in sterile jars to await analysis.

The federal law says that gelatine shall not contain more than 30 parts per million of copper, 100 parts per million of zinc, 20 parts per million of lead, 1.4 parts per million of arsenic oxide, 350.0 parts per million SO_2 . Pennsylvania and North Dakota exclude lead and SO_2 . Modern methods of manufacture make it relatively easy for the gelatine manufacturer to comply with these rulings. A proposed regulation for New York City recommends as a standard that edible gelatine be free from B coli group as well as conform to federal standards.

Determined Bacterial Count.

With these samples that we received our first step was to determine their bacterial content and over 17 samples found the highest to contain 60,000,000 and low 100 per gram. Hammer, of the Iowa State College, found on analysis of five samples a variation of 113,000,000 to 35 per gram, which meant an addition to the bacterial count of the ice cream to which it was added of 565,000 to .2 per gram when 05 per cent is added. In this day and age when bacterial counts are meaning so much especially to the consuming public, we must do all that is possible to lower our counts. In a recent collection of samples of ice cream mix found that it contained from 9,200,000 to 100,000 with an average of 1,500,000.

How many of these organisms came from gelatine I can't say, but the organisms which are contained in gelatine are resistant to heat, cold and drying to a marked degree and they may cause us many undesirable fermentations in our mix. The presence of B coli type organisms was determined in these gelatines. B coli belongs to the same family as B. typhous and is associated with fecal or decaying matter. To find B coli in our city water is considered serious. To find it in milk except in very small numbers is serious. But yet the ice cream man

doesn't think that his gelatine might be a perfect host of B coli organisms. In these samples which were collected in one sample we obtained 35,000,000 B coli organisms, two more with 600,000 and 750,000 respectively. And in all cases where the total bacterial count exceeded 5,000 organisms per gram B coli was present. Another type of organism that was predominate in gelatine was what is termed the liquifier or protein digester or gelatine digester.

It breaks down the protein into lower protein compounds such as amino acids and renders the gelatine useless as a colloid and in jellying power. It would be splendid if the gelatine manufacturer would label each batch of gelatine as to its bacterial count and content as the fertilizer man does, but as he does not, some simple little test is necessary for him to use. While working with jellying points of different gelatines I noticed that in those that were high in bacterial count, I would find gas bubbles and liquification.

This gave me an idea. In milk you know we have what is termed the fermentation test that gives an index as to the quality of the milk. So we tried the fermentation test on gelatines and found that it worked splendidly, getting gas wherever B coli was and liquification where liquifiers were. I have here some sample that I prepared yesterday. The technic of the test is simple. Take a test tube and put 2.5cc of water into it and one-fourth gram of lactose. Sterilize and after sterilization bring the water to a temperature of about 100 degrees F. and introduce into the tube 2.5 grams of gelatine. At this temperature or slightly higher the gelatine should dissolve with slight agitation, being careful not to incorporate air bubbles. The tubes are allowed to remain about 18 hours overnight at a temperature of 60 to 75 degrees F. and are then read. A general idea can be gained as to the bacterial contamination by the degree of liquification and number of gas bubbles. Also in performing this test one gets an idea of the ease with which the gelatine goes into solution and to a very slight degree its jellying properties. The only necessary caution to be taken is that the water with lactose and tube must be sterile and in introducing the gelatine care must be taken to avoid contamination.

Cutting Down Bacteria With Gelatine.

In my mind the two things that stand out foremost in ice cream manufacture are healthfulness and uniformity. If a sample of milk was sold to us containing 8,000,000 of organisms, we would immediately notify the health department, but if ice cream with 8,000,000 organisms per gram is sold, nothing is said. There is a report that a sample of ice cream that was obtained in the City of Milwaukee contained 8,000,000,000 p

Is he standing between you and your profits?

YOU may be satisfied with the amount of orders—may have no complaint to make of production—yet your profits seem slim for the amount of business handled.

Your cost sheets will show you that liquid milk is the white elephant standing between you and your profits. Using liquid milk you must pay for the handling and washing of cans, pay for extra refrigeration, for extra sanitary precautions and milk that sours.

That is why so many ice cream manufacturers are now using Merrell-Soule Powdered Skimmed Milk. They save all this unnecessary expense as Merrell-Soule Powdered Skimmed Milk can be purchased in barrel lots and stored without ice—for use when and in just the amount needed. Incidentally, you can guarantee the quality of your product when you use this powdered milk, as it is always absolutely uniform in grade. There is profit for you in

The Corrosion of Metals by Refrigeration Brine

By EMERSON P. POSTE and MAX DONAUER*

THE presence of fine particles of iron oxide in brine is frequently noticed. Under some conditions the pieces are rather large and cause definite trouble by becoming lodged in valve seats causing loss of brine. In reciprocating pumps the cylinders may become scored. And in extreme cases low points in the brine system may become clogged necessitating cleaning and frequent flushing out to avoid further trouble. The formation of this oxide represents corrosion of metal throughout the brine system. Field observations indicate that brines from plant to plant vary in the tendency towards causing this type of trouble. A study of this problem was undertaken in hopes that the fundamental principles might be arrived at and a remedy devised.

Assuming that the firms manufacturing refrigeration machinery had looked into the problem, their co-operation was solicited and they very willingly contributed their observations. Knowing that various types of brines were on the market, representative supply houses were consulted with reference to the claims for their respective products. Field data available were carefully studied. The general indications coming from these various sources formed the basis of rather extended researches which it is hoped may be of value to the industries interested.

Experience of Refrigeration Engineers.

The information coming from the machinery people may be presented tersely as follows: There are three

* Director of Laboratories and Chemical Engineer respectively, Research Laboratories, Elyria Enamelled Products Co., Elyria, Ohio.

types of brine in commercial use: "Natural" calcium chloride, "soda by-product" calcium chloride and sodium chloride or common salt. In general the sodium chloride brine is held to be more corrosive than the calcium chloride. As to the types of the latter, there seems to be no essential difference in the fresh brine providing it is free from magnesium chloride. Brines have a tendency to become corrosive upon exposure to air. Leakage of ammonia into brine, particularly one containing

magnesium chloride, produces a corrosive condition. Other contributory elements are galvanic action due to contact of unlike metals, and stray electric currents. Brine should be kept alkaline by the addition of lime either in the form of lime water or by means of a sack of lime hung in the brine tank.

Claims of Calcium Chloride Distributors.

The distributors of "soda by-product" calcium chloride make, in general, the following statement. Sodium chloride brine, particularly that containing magnesium chloride, is very corrosive. Calcium chloride brine is much less corrosive, especially if free from magnesium chloride. Ammonia leakage is less harmful in a pure brine of this type and there is less trouble from galvanic action or stray currents. Any brine exposed to the air turns corrosive. Lime treatment will keep a pure calcium chloride brine relatively non-corrosive, but the treatment of a brine containing magnesium chloride will not accomplish the desired result. In general, the burden of the contention is that the calcium chloride brine should be pure and protected from unnecessary contact with air. The following was submitted as a typical analysis of the solid chloride:

Calcium chloride	73.59%
Sodium chloride	1.45%
Magnesium chloride00
Insoluble in water07
Total solids	75.11
Water	24.89

Name

Address

Date

This is spoken of as "75% calcium chloride."

Essentially the same points are covered in connection with "natural" chloride. The following is submitted as indicating the composition of the solid product:

Calcium chloride	74.07%
Sodium chloride51%
Calcium hydroxide08%
Magnesium chloride00%
Total solids	74.66%
Water	25.34%

This is mentioned as "a straight calcium chloride, clean and white and non-corrosive."

Field Observations.

Field samples of solid calcium chloride were obtained and studied as to composition, with the following typical results:

Sample	Source	Calcium Chloride	Magnesium Chloride	Nature of Fresh Brine
1	By-product	71.6%	none	Alkaline
2	Natural	75.6%	trace	Alkaline
3	Unknown	45.8%	18.4%	Alkaline

Sample No. 3 was submitted by a firm having definite corrosion trouble.

Of several samples of brine obtained from the field, some were alkaline, some acid. Some showed no magnesium chloride, other traces, and the one corresponding to No. 3 above, 3.50%. In general the acid brines all those containing magnesium chloride came from plants having trouble with corrosion.

Experimental.

With the above as a background a large amount of experimental work was done to check the points brought out and to further the knowledge of the subject. The work will not be covered in detail but the essential findings will be presented.

The main point of interest is the effect of varying alkalinity and acidity on the rate of corrosion. Chart I has been plotted from the data obtained. The corrosion is expressed in terms of a relative scale. Alkalinity is stated in terms of free calcium hydroxide or dissolved slaked lime and acidity in terms of free hydrochloric or muriatic acid. The original brine was from a commercially pure calcium chloride. It was treated with lime and acid to produce a range of from the equivalent of 0.5% free lime to 0.3% free hydrochloric acid. Separate corrosion tests were run at regular intervals throughout this range. It is evident that to keep corrosion at a minimum the alkalinity must be greater than 0.1%.

The second point of interest has to do with the rate at which a brine originally alkaline will turn acid. Samples of pure brine were treated with alkali to produce a range of alkalinity from .0 to 0.4%. Air was bubbled through the samples of liquid and observations as to loss of alkalinity made. Chart II indicates the time required under these conditions for brines of varying initial alkalinities to turn acid. Initial alkalinity is expressed as free calcium hydroxide, and the time required to turn acid in days. As in Chart I, the break in the curve comes at a free lime content of 0.1%.

A third point of major interest is the relation of the density of the brine to the rate of corrosion. Chart III is plotted from data obtained in studying this phase of the problem. Rate of corrosion is expressed as in Chart I. The gravity of the brine is in the "rational" scale. Commercial brines submitted to this laboratory have varied in gravity from 1.10 to 1.20, corresponding to 13 degrees and 24 degrees Baume respectively. The

Everything for the Dairy Industry

You can improve your product and increase your ice cream profits with

Viscolizer and Simplex Cooler in plant of Rainbow Ice Cream Co., Chicago

Ice Cream Mix passed through a viscolizer becomes a foundation for a smoother, richer feeling ice cream, without requiring an excess of any of the materials beyond the regular formula. The butter fat in the cream is finely divided by the action of the viscolizer and united firmly with solids, not fat, the filler, the sugar, and the gelatine. These ingredients then remain united in the freezer, always giving a smooth rich feeling cream.

A fine quality cream can be developed from sweet butter and skim milk, or skim milk

The VISCOLIZER

powder. The Viscolizer action unites the solid ingredi-

ents and subdivides the particles to such a fine degree that the butterfat no longer possesses sufficient buoyancy to separate by gravity while standing in the can or bottle. Virtually all the cream thus made retains a uniform density and an increased viscosity, popularity regarded as a full thick cream.

Every ice cream manufacturer needs the Viscolizer—made in various sizes and capacities to meet the need of every plant, large or small. Let us tell you more about it.

The new Barber catalog, the most complete book of its kind published, is on the press. On request, we shall be glad to send you a copy as soon as it is ready for distribution.

curves indicate that the corrosion produced by 1.20 brine is less than half of that produced by 1.10 solution. The curves also show the relative corrosion produced by good and poor brines.

Additional facts brought out experimentally were that, other things being essentially the same, brines containing magnesium chloride become acid more quickly on contact with the air; the presence of magnesium chloride

ride in brine results in a severely corrosive condition when ammonia is introduced; the change in the brine brought about by contact with air is one of absorption of carbon dioxide resulting in the destruction of alkalinity that may have initially existed; metal surfaces intermittently wet with corrosive brine corrode faster than those constantly wet; surfaces alternately in contact with brine, steam and air corrode with greater rapidity than under the last named conditions; the corrosive action of brines is not strictly an action of acid on metal but one of oxidation taking place in an acid solution.

With the above facts established the problem came one of determining the reliability of the suggested lime treatment as a means of controlling the situation. It was found that the addition of lime to a corrosive calcium chloride brine in sufficient quantity to produce an alkalinity of at least 0.1% resulted in a reduction of the corrosion to a minimum under all conditions of service but that the addition of greater amounts did not produce added results. This statement did not apply to brines containing magnesium chloride. The addition of lime thereto produced insoluble magnesium hydrate but did not result in the desired alkalinity, nor reduce the rate of corrosion to a minimum.

As to the manner of introducing the lime there are two possible methods, each with its advantages. The frequent addition of lime water or milk of lime would call for chemical control to be sure that the necessary minimum of 0.1% be reached, but it would be possible to keep just above this figure and so prevent unnecessary absorption of carbon dioxide. But to be safe without chemical control it would be better to hang a bag of lime in the brine tank and allow the solid to be taken into solution automatically. This would produce a

EXACTNESS

There is no doubt in the minds of local Contractors as to the precise quantities of Building Material being used in the construction of this building.

The designs were drawn by The McCormick Company architects and the construction is being supervised by their engineers.

Every uncertain factor has been eliminated by long years of specializing in Dairy and Ice Cream Plants.

Plant capacity has been fully predetermined and a production basis used that will permit maximum net profits.

Each department is laid out to fit accurately and smoothly in one complete working unit. Mechanical arrangements have been perfected to avoid waste space. Heat, Light and Ventilation have been figured out in harmony with the most advanced application of long, practical experience.

If you are contemplating a new building, if spasmodic additions have lessened the efficiency of your production, or if you have in mind remodeling a property formerly used for other purposes, The McCormick Company can help you. Write to us immediately concerning what you have in view.

THE MCCORMICK COMPANY, INC.

NEW YORK
41 Park Row

alkalinity approaching 0.5%, but with care to avoid unnecessary contact of brine with air absorption of carbon dioxide would be controlled.

The foregoing presentation of experimental facts has dealt with calcium chloride brines. Investigation regarding sodium chloride has indicated that the freshly prepared solution is neutral and remains so in use. It is of a severely corrosive nature, however, probably due to an induced oxidation. The addition of lime to this

type of brine greatly reduces the rate of corrosion. An alkalinity of from 0.1 to 0.2% is possible as a maximum. These statements are based on laboratory studies only. There has been no opportunity for field investigation of this class of material.

Summary.

The findings may well be reviewed. Because of its more general use only calcium chloride brine will be included. Essentially pure calcium chloride brine is alkaline when first made but it soon turns acid on exposure to air. With this acidity comes a marked increase in corrosive action. The activity is materially increased by the presence of magnesium chloride, as a result of the earlier development of acidity and the formation of corrosive ammonium chloride in the case of ammonia leakage. Contact of unlike metals or the

presence of stray electric currents increases the rate of corrosion of a pure brine and the presence of the above impurities accelerates these electric tendencies. The corrosive action of brine decreases with increasing brine density. Chlorides are on the market which are contaminated with magnesium chlorides, though first class materials are available both as soda-by-product and natural chlorides. Corrosive brines free from magnesium chlorides may be corrected by treatment with lime if the alkalinity produced is maintained above 0.1%. This is really done by keeping a supply of lime in a bag hung in the brine tank.

Conclusions.

The careful plant manager who is interested in avoiding operating irregularities, in keeping his equipment in the best of condition and in getting the most out of it will use only the best of chloride in making his brine. He will keep the gravity approaching 1.20, will hang a bag of lime in his brine tank and maintain therein a good supply of material and will avoid unnecessary contact between brine and air. It will pay him to take these precautions. Initial savings by the purchase of inferior chloride and the use of weak brine will be much more than offset by corrosion of metal in the entire brine system.

We wish to acknowledge our obligation to the firms that have submitted commercial samples of chloride and brine, the refrigeration companies who have so freely given their suggestions and the chloride supply houses that have co-operated in the work. We hope that our combined efforts may be of value to the trade.

ICE CREAM PROGRAM FOR DAIRY SHOW.

On October 5th and 6th the sessions of the World Dairy Congress at Syracuse, N. Y., in connection with the National Dairy Show, will be devoted to matters of interest to the ice cream industry. It is generally believed that these sessions will be highly interesting to ice cream manufacturers, and a cordial invitation has been extended to them to be present.

Syracuse will not be overcrowded on these days by other branches of the industry, which also have days of their own. It is suggested by Secretary Loewenstein of the National Association of Ice Cream Manufacturers that members arrange to attend the sessions mentioned and make reservations without delay. The Onondaga Hotel at Syracuse is probably the most desirable one there.

Illinois Association Was Trade Pioneer

By L. W. ROSZELL*

THE Illinois Association of Ice Cream Manufacturers was the first organization of ice cream men ever gotten together and although it was not at that time known as the Illinois Association it was the forerunner and the foundation upon which was built the great National organization and all of the many great state organizations that now exist. The Illinois Association is second to none in point of efficient functioning and has consistently adhered to a policy that has promoted and developed the ice cream industry in Illinois to a degree that has caused many states to turn to Illinois for guidance and advice. I reiterate, therefore, that it is a pleasure to call this great convention together. It has been a signal honor indeed to have acted as your executive officer for the last year and while there have been no great legislative matters to be looked after nor unusual policies to be determined upon as there have been in previous years, still we find our association carrying on persistently and quietly the work of promoting a better and clearer understanding amongst manufacturers.

We find conditions in the State of Illinois much better than we find them in some other sections of the country. We find a spirit of co-operation along all lines, that has unquestionably done much to promote the prosperity of the ice cream industry in this state.

It is a difficult matter for your executive officer to address you at any very great length without trespassing upon some of the subjects that are covered in the splendid program which we are to enjoy at this convention and I would be remiss in my obligation as your executive officer if I did not say to you that I think

this is one of the most splendid programs that we have ever had and I want to qualify this statement by saying that as president of the association, I have had absolutely nothing to do with getting it together. It was all made up by our 100 per cent Secretary, Nathan, and I did not see it until it was ready for the printer.

The only thing that makes me hesitate in making this statement is the fact that there are very few associations that have a secretary of this kind and I am afraid that if these remarks of mine get beyond these four walls some of these other gentlemen in other associations who are elected to the job that I have been holding will commence to bid for our secretary's services, so I think that just as a matter of precaution and not running any possibility of having him plucked from the family, that we just better have this portion of these remarks stricken from the records.

However, in all seriousness, I do wish to say that the services of our secretary have been of the highest not only in the past twelve months but in the number of years that he has handled the job and I know we are all agreed on this point.

The greatest activity of this association for the past year was, of course, the zone meetings with which you are all familiar. Zone meetings were an innovation of the Illinois Association that I believe have been emulated by a great many other associations. It has been of unlimited value to manufacturers in this state to be able to meet in these group meetings and discuss with absolute frankness and with friendliness the many problems that have confronted us. To my mind, this is the greatest good that our organization can accomplish and I hope to see group meetings continue possibly even with more frequency than they have been held in the past.

Right at this point I desire to pay tribute to those splendid men in this organization and you all know who they are, who consented to act as Zone Captains during the past year. The amount of good that was accomplished by the unselfish service of these men in taking their time and devoting a great deal of energy toward harmonizing the many small arguments and disagreements that came up in their respective zones cannot be estimated and they may hold in their memory the reward of knowing that they have rendered a very great service.

In spite of the harmonious relations that exist throughout the state with great predominance, there were still more irregularities with which we are all more or less familiar and it is to be hoped that many of these will disappear during the coming year and that a closer bond of relationship and co-operation will be had amongst manufacturers in this state. In Illinois we are no different than the rest of the country and I do not believe that we should be ashamed to admit that our results insofar as gallonage, etc. were concerned for the year's operations were somewhat disappointing but I think in making this admission that we should consider some of the contributing causes for that condition.

First and foremost, of course, of these causes is the weather. Weather conditions affect the ice cream industry more than they do any other industry in the world and we had anything but normal ice cream weather during the past season.

Coupled with unfavorable weather conditions, we had a peculiar situation in Illinois to which I desire

The Elyria Culture Tank or Starter Can

A Development of Unusual Interest for the Creamery

An illustration of the Elyria Starter Can used by the Tip Top Creamery of Vincennes, Indiana, also two 500-gallon Ice Cream Mixing, Aging & Storage Tanks installed in 1920 for the same organization.

THE Elyria Glass Enameled Starter Can—built up to the high quality standard of all other Elyria Equipment—is a small, compact and thoroughly efficient unit, designed especially for the manufacture of starter. It can also be used successfully for holding and cooling in small quantities.

A 30 inch by 48 inch insulated Starter Can, equipped with 18 inch agitator and direct current variable speed motor, is used by the Tip Top Creamery of Vincennes, Indiana, for culture buttermilk. All processing is done in this tank—steam, water and brine being connected to one head. Agitation is perfect and cooling rapid. According to the Tip Top Creamery, the Elyria Starter Can is the ideal machine for their purpose.

Avoid Substitutes for Delft Gelatine

Dr. Frank Crane says, "The pest of the business world is the SUBSTITUTE. A man spends many years and much money developing a product, and when he has created a demand for it, along come the rascals with substitutes and undersell."

There is no substitute that compares with Delft Gelatine. Made in Holland, in the cleanest of factories, of the best materials and by skilled workmen, it is the kind of a gelatine you want to put into your goods. It is unequalled in purity, strength and freedom from harmful and liquefying bacteria. And it costs less because it goes farther.

THE ICE CREAM REVIEW COVERS AMERICA LIKE THE DEW.

direct your attention and if you have not thought about it, it might be well for you to give it some thought for it bears a direct relation to the volume of your business and the profit you derive from it. I speak of the general industrial situation. We have, in the State of Illinois, a great industrial state, one of the greatest in the Union. We were hit with two tremendous strikes this past summer. The coal strike and the railroad strike and on account of our great coal producing areas and our great industrial activities, these two strikes, without doubt, had a very material effect upon the ice cream business.

You not only had the wage earner who was on strike not buying your ice cream but there was created in Illinois, as you are well aware by incidents that were unpleasant, in the extreme, an atmosphere of timidity brought about by lawlessness and high handed action that caused a tightening of the purse strings of the consuming public. Citizens opened their newspaper with a tremor of fear wondering what would be the next headline to startle them. Unquestionably with a great commonwealth, whether it be the State of Illinois or any other state, in a turbulent frame of mind such as we were this past year, we cannot expect normal or in fact, anywhere near normal business in any line and it is to be hoped that during 1923 this can be eliminated as one of the factors in the conduct of any business and that the citizenship of our great state and in fact, the entire country will be contentedly living their lives promoting industry and gaining the prosperity that the country affords. This coming true you will find will make a tremendous difference in your operations as an ice cream manufacturer no matter where you are located.

This brings one more point to mind and that is that though you are an ice cream manufacturer you are not isolated and the problems that effect the wage earner or the industrial corporations or the problems that confront the farmer, in fact, every other class of our citizenship, are your problems and as an influential citizen and businessman of your community it is up to you to take your place in the affairs of your community, assume your full share of responsibility in helping to solve these problems which you have found out effect you and your business very materially. This influence, as a member of one of the greatest industries in the country, should be thrown into your local community in the cause of good government. This should reflect itself in your city, in your community, in your state

and in your federal government. In other words, whether you like politics or not you should at least take enough interest in politics together with the other right-thinking people of your community, to see that good government does not cease to function. You may possibly think that it is a little bit strange that this thought should be brought to you here but we must have in this great United States of ours a new awakening to our responsibilities as self-governing citizens or else we are going to be governed, you and I, whether we like it or not by a minority which is on the job 365 days and nights a year and I hope that if you remember nothing else that I have said to you today that you will go home and remember this one important responsibility that you have although it does not have anything to do with the price of sugar, salt, ice or anything directly connected with your business. As an intelligent body of men, this Illinois Association of Ice Cream Manufacturers can do much along the lines that I have just suggested.

It is impossible to more than passingly predict what conditions are going to be in 1923. We all hope to see many of the problems that have confronted us in past years eliminated in 1923. We all hope to see a stabilized material market. We all hope to see a stabilized employment situation but whether or not these things come to us in 1923 is a matter upon which no one can make a definite prediction. There are certain problems that in my opinion will confront the ice cream manufacturer.

I believe that the enactment of the tariff is going to cause an increased cost of materials in 1923. I believe that certain materials should cost more. I refer especially to the materials which we purchase from the farmer. I believe a lot of the difficulties that we have encountered in this country in the past two years have been due to the fact that there is a too decided difference between the price of farm products and the price the farmer is obliged to pay for those things which he buys. I do not attempt to say whether the commodities which the farmer buys should come down or whether the price of the farmer's products should go up but I do say, without fear of contradiction, that these two items must come closer together before we have our agricultural industry upon a basis where it will resume its great purchases of machinery equipment, and the thousand and one other things used in the industry.

Another thing that must be met by the ice cream manufacturer and this applies especially to the manufacturer who ships ice cream, is the transportation prob-

A better way for handling Cylindrical Containers

To meet the demand for greater ease in handling the cylindrical container the O-B Triangular Packer was designed. That it accomplishes its purpose is best proven by the number of repeat orders we receive for these packers.

The O-B TRIANGULAR PACKER

saves handling packages by the retailer in selecting flavors and makes deliveries easier for the ice cream manufacturer. The quality of your ice cream is also preserved to a higher degree on account of the more uniform refrigeration distributed to all containers.

New York City

lem. Transportation during 1922 was anything but satisfactory. In my opinion the ice cream industry is paying excessive transportation rates upon its products. Some manufacturers have attempted to meet this by truck deliveries and many of these have found this method of transportation prohibitive in cost and it is only being continued because some competitor is using this means of transportation. It is to be hoped, therefore, that this problem of transportation will be seriously considered and made a part of the program of activities for this association during 1923 with a view of obtaining to some degree some relief from the exorbitant cost that is now being tacked upon your finished product in its transportation from your factory to the country customer.

In conjunction with high transportation costs, there is a problem that confronts each individual manufacturer in the ice cream business, one that has been discussed many times under many circumstances and usually without any results. I refer to the problem of educating the retailer who stands between you and the ultimate consumer to his responsibility as a link and a most important link, in the chain of distribution of your products. It is my firm conviction that every manufacturer in this room could well afford to pay a high class, expert a very good salary to do nothing else but spend his time with the retail customer not as a critic, but as a friend and helper to this retailer in making him a better merchant. For example, showing him how to arrange his store more attractively, how to eliminate some of the things at his soda fountain that are offensive to the paying public, how to secure more turnover, not only of ice cream but other items of his store so that he would feel justified in taking a less profit on each sale. Do you realize what you have done when you have educated a retailer along these lines? You

have made it possible for the two or three hundred consumers who eat your ice cream and buy it through the retailer who has been educated along these lines, to buy more ice cream for the same amount of money than they have been paying for a smaller amount simply because this retailer has been awakened and is gaining more turnover on all of his items in his store, is making more money than he did under the old system and distributing a great deal more of your product.

So, gentlemen, do not overlook the retailer during 1923. You have got to have him, he stands between you and the consumer and so long as this is the case why not make him, through conscientious helpful cooperation, a 100 per cent representative for you? In closing, if I have, in discussing generalities, as I have attempted to, trespassed upon any subject which is of our program, I desire to apologize.

I want to thank you for your attendance to this convention, the interest that you have displayed in the activities of this organization for the past year. I also desire to thank each and every one of the men who have responded with talks and papers on our program, for it is through co-operation of this kind that trade organizations such as we have, are fostered and kept alive to do the good that they accomplish.

I am convinced that the Illinois Association of Ice Cream Manufacturers is in splendid shape. Each succeeding year for the past 35 years has shown improvement and solidity in our organization. It has never been torn by fractions or selfish disputes of one group against another.

It is my sincere hope, and I am sure you all agree with me, that this splendid record of achievement and harmonious existence be not broken, and that Illinois shall present to the ice cream industry and to every industry in the United States, a Manufacturers Association second to none. Responsibility, of course, for this rests squarely upon the shoulders of each and every member of the organization and as I look out upon you today I am sure you realize your responsibility and that the pride you feel in the splendid achievements of the past is going to cause a solemn resolve upon your part to carry on and grow better year by year.

I am proud to have served as your executive officer and it shall be not only always a very keen pleasure to give my best to the association but a privilege to be allowed, at any time to be of service to any individual in the organization. Thank you.

ERICKSEN LEAVES DETROIT.

Fred E. Erickson, known to many readers of this publication through his connection with the Olsen Publishing Company for several years, announces that he has severed his connections with "Dairy Products Merchandising" of Detroit.

Mr. Erickson was general manager of the new Detroit enterprise and has been the leading spirit in introducing it to the dairy trade. His family remained in Milwaukee during his Detroit experiment, so all he had to do was to pack his grip in order to move back to "the old home town."

"Fred" will take a few weeks' vacation before announcing his future plans. His many friends in the industry will hope that his next business connection will be pleasant, and that he may find abundant opportunity for serving the industry in a way which his ability merits.

Study of Gelatine for Manufacture of Ice Cream

(Continued from page 60)

gram. There are many ways in which to cut down the bacterial content of ice cream and one of them is the use of gelatine with a low bacterial count. Low bacterial count with no B coli present will mean a more healthful product and a product to be proud of.

Plate 1.

The jelling power of a gelatine is important as it is the jelly strength that increases the viscosity of the mix and aids in the incorporation of air. How do you

determine the jelling power of your ice cream? There are numerous tests such as the thumb test which I believe is used by some Indiana manufacturers. Where a definite solution of gelatine is made with the fore finger the strength of the jelly test. This while a good test gives us no very definite results. There are other tests such as the buck shot test, Lipowitz test and the Kessling test, all of which are an index of the jelly power, but to me the simplest and easiest way giving definite results is to make up definite percentage solutions of the gelatine as 1 per cent, 1.5 per cent, 2.0 per cent, 2.5 per cent and so on in test tubes or beaker or flasks and allow them to stand an hour at 60 degrees F. and then taking the strength as that lowest solution which will remain intact upon inverting. By this method, I have found some gelatines will jell in a 1.5 per cent solution while another did not jell in a 20 per cent solution. A majority jellied in a 5.0 per cent solution and a few jellied in a 2.5 per cent solution.

Out of 11 samples examined 18 per cent jellied in a 1.5 per cent solution, 18 per cent in a 2.5 per cent solution, 29 per cent in 4.5 per cent solution, 18 per cent in 5.0 per cent solution, 9 per cent in 6.0 per cent solution, 9 per cent in 28 per cent solution. The jelling power of a gelatine can quickly be altered by heating. Excessive heating can cause a gelatine to lose all its jelling power, but each heating a gelatine recovers causes a lowering in jelling power. The acidity of the gelatine or the ice cream mix may affect the jelling power, either way, increase or decrease.

We found that gelatine that were nearly neutral had the greatest jelling powers. While according to work done by Loeb that gelatine which is slightly acid has the highest jelly. I have heard of gelatines that are so acid that they would curdle the mix. I cannot say how this is possible because such small amounts are used, unless the gelatine was acid and added to the mix.

Plate 2.

that was on the verge of curling, at which time the acidity of the gelatine was sufficient to throw it out of the mix.

The chemical composition of the gelatine was studied in hopes that through the chemical composition we could obtain information as to the conditions under which the material used in the gelatine before drying. I expected those gelatines that showed a high bacterial

content would correlate with the content of amino acids and peptones. There is a slight correlation between the amino acid content and bacteria and we are studying this point further in hopes of obtaining some definite information.

In regard to color and odor, so far we have found no relationship between color and the other factors we have studied, but the color should be clear and all the gelatine should go into solution. Brands of gelatine are oftentimes made by mixing a little good with some fair and some poor and poor gelatines will oftentimes cloud up, though one of the clearest gelatines we received had an extremely high count and only a fair jelling power. The same may be said of odor, the gelatine with the most offensive odor showed presence of B coli in small numbers and its bacterial count was 10,000. Odor for a gelatine is best tested by heating to 160 degrees F., as quickly as possible. At this temperature a disagreeable odor can quickly be detected. Gelatine should have practically no odor.

We are continuing our gelatine studies here and the next time we meet, I hope that I can have the privilege of giving you more information. But this morning I hope I have impressed upon you that gelatines cannot be differential by looking at them.

The appearance of the samples at the start of the "melting resistance" experiment. Sample No. 1 contains no gelatine, sample No. 2 contains poor quality gelatine, sample No. 3 contains good quality gelatine, and sample No. 4 contains very good quality gelatine.

Same samples as shown in Plate 1 after 30 minutes exposure. Sample No. 1 had decreased in weight 9.8 per cent, No. 2 had decreased 5.55 per cent, while samples No. 3 and 4 had decreased but 0.26 of 1 per cent.

PROF. LUTHLY JOINS NAFIS ORGANIZATION

Prof. John A. Luthly has resigned his professorship in the dairy school of the University of Nebraska and has accepted the position of assistant manager of Louis F. Nafis, Inc., of Chicago, well known manufacturers of "scientific glass apparatus for testing milk and its products."

Prof. Luthly, after his graduation in 1914 from the Dairy School of Iowa State College at Ames, became instructor there, remaining on the faculty for three years. He then spent one year in commercial creamery and milk plant work in Danville, Illinois, part of the time with the Sugar Creek Creamery Company. From there he went to the University of Nebraska, where he was assistant professor in the dairy school, being in charge of the dairy manufacturing department and doing research work in the experiment station. When Nebraska passed a law requiring that all test bottles and milk pipettes be calibrated by the state he was in charge of this work in addition.

Professor Luthly is a member of the American Dairy Science Association and an honorary member of the Nebraska Creamery Butter Manufacturers' Association.

JOHN A. LUTHLY.

CLEVELAND SHOW EXPECTED TO DRAW 4,000

A registration of 4,000 persons is expected at the second national exposition, according to the Association of Ice Cream Supply Men. The association is confidently pursuing its plans on that basis.

This expected registration will set an altogether new mark in such matters.

The second national exposition, to open in the Cleveland Public Hall at noon Monday, October 22nd, will coincide in date with the assembling of the 23rd annual convention of the National Association of Ice Cream Manufacturers, in the auditorium of the Chamber of Commerce Building, two city blocks distant.

The exposition will be open for inspection every day during the week October 22nd to 27th inclusive.

The day of publication of this number of The Ice Cream Review something less than 5 per cent of the total display area of the two large floors, which total 60,000 square feet, of the public Hall remained unleased according to The Association of Ice Cream Supply Men.

An important innovation, according to the association will be the inclusion of an extensive educational display, the full details of which are not ready to announce. It is known, however, that educational institutions, different branches of the government, and various trade and professional organizations engaged in part in educational work will participate.

Several hundred reservations already have been booked by Cleveland hotels.

It will be several weeks yet before the complete entertainment plans are announced.

Growth of Motor Transportation in Dairy Industry

Exhibits at Electric Truck Show Described

SETTING forth the economy of electric trucks, as compared to other types of commercial vehicles, the New York Edison Co. held one of its most successful electric automobile shows in the main showroom of that company during the week of June 2nd. Trucks for every use in the dairy industry were among those exhibited.

Many of the members of the National Electric Light Association, and delegates to the national convention, which was held at the Hotel Commodore, New York City, were among the enthusiastic visitors at the Edison showroom. Thousands of people visited the exhibition and the salesmen of the nine truck companies represented and those exhibiting charging apparatus and accessories reported large numbers of leads obtained and many sales made.

Every type of electric trucks was exhibited at the show, including specially designed electrics in operation, including a fifteen-ton crane truck, as used for handling heavy reels of cables, or operating clam shell buckets for moving coal and other materials. The new electric autocar was exhibited by the Autocar Sales and Service Company for the first time. Besides the many different kinds of electric vehicles being shown, there were charts and special displays giving the latest methods of storage battery charging, automatic charging and many interesting cost data figures on the delivery of merchandise.

Especially interesting among these was the "one dollar race" board, an illustrated exhibit showing the comparative cost and mileage of electric, gasoline, and horse-drawn trucks, as indicated by figures compiled by the Massachusetts Institute of Technology. These statistics show that an electric will operate four miles to the dollar, as against three and one-half miles to the dollar for horse-drawn vehicles.

Members of the Electric Truck and Car Bureau, of which C. R. Skinner, manager of the Automobile Bureau of the New York Edison Company, is chairman, predicted at their convention meeting that except for a few pleasure vehicles, the horse will have entirely disappeared from the streets of New York within a few years. They pointed out that in 1917 there were 56,000 horses in New York City, while in 1921 that number had been reduced to 33,104. The economy of electrics also was stressed and their superiority over other types of trucks was illustrated by interesting statistics. It was said that gasoline trucks proved their worth in runs of sixty miles and over, but for city work the electrics were superior. The head of the Truckmen's Bureau, representing 75 per cent of the industry in New York, said that electrics are rapidly replacing gasoline motor trucks for short haulage.

The most distinguished visitor at the showroom during the entire week was Thomas A Edison, who took great pleasure in noting the present high point of development of the electric truck. He seemed to be especially interested in the two old electric pleasure cars, the first to be run on the streets of New York.

* * *

Among the Exhibitors.

Interest in electric trucks is rapidly growing in the dairy industry. Dairymen, milk dealers and ice cream manufacturers are turning to electric carriers in all parts of the country.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

This publication has gathered information concerning the different electric trucks exhibited at the Electric Automobile Show staged by the New York Edison Company in New York the week of June 2.

The following descriptive matter, prepared by officials of the firms exhibiting, will be found of interest to readers:

Ward Electrics.

The Ward Electrics are worm driven; the type that is used on more than 72 per cent of all gas trucks. Ward Electrics are standardized in other respects: Sheldon axles, Spicer universal joints, Firestone tires, General Electric motor, and Exide, Edison, Philadelphia or K-W batteries, etc.

Ward
Worm Drive

Walker Electrics.

No waste of power while standing still, no shifting of gears, and a quick-even pick-up make Walkers' ideal for congested city traffic and many stop routes. In addition, Walker trucks are clean, neat in appearance, free from engine heat, noise, dirt, contaminating odors and are dependable. The simplicity of design and operation of Walker electric trucks insures a remarkably low number of trouble calls.

Six Walker Models.

There are six Walker Models, ranging from ½ ton to 5 tons in capacity. They are as follows:

Model 12....1,000 lb. cap.	Model P.... 7,000 lb. cap
Model 22....2,000 lb. cap.	Model N....10,000 lb. cap
Model 42....4,000 lb. cap.	Model M3.....Parcel Del

All models except Model 12 are equipped with the famed Walker balance drive, which is at least 97 per cent efficient at all speeds and loads.

* * *

C-T Electric Trucks.

The three main features of the C-T electric truck, its power plant, its frame and its control stand out as distinctive. The main features of this design were adopted sixteen years ago, when the first C-T was built. In all those years it has been retained intact, except for a number of refinements, and has proven its worth in the service of many hundreds of users.

Instead of using a single motor and dividing the power between the driving wheels, the C-T makes use of a separate motor geared and in fixed relation to each driving wheel. This principle eliminates the necessity for propeller shafts, universal joints and differential gears, making an extremely simple rear assembly and providing maximum traction. The

For "Bulk" Individuals

There is distinction and profit in selling bulk ice cream in individual packages. The public takes to this manner of service and

THE PERFECT PACKAGE

is an ideal container for the purpose. It is easily filled, and closed with a handy pull cover, it can be quickly opened by the consumer without the usual inconvenience.

This feature alone has won great popularity wherever in service. Furthermore Perfect Packages are highly sanitary, attractive in design and have big advertising value.

YOUR INSPECTION OF A FEW SAMPLES WILL CONVINCE YOU OF THEIR SALES POSSIBILITIES. BETTER WRITE TODAY.

The Perfect Package Co., PARKHURST AND DAWSON STREETS Newark, N. J.

Wisconsin Representative: A. MICHELSTETTER, 405 Broadway, Milwaukee, Wis.

IDEALS

To think only of the best, to work only for the best and to expect only the best in quality ice cream, is the ideal of the wise manufacturer.

To assist in attaining these desired results is the ideal for which

Wyandotte
Sanitary
Cleaner and Cleanser

was manufactured, an ideal which has been constantly maintained for over twenty years.

During this period a steadily increasing demand for this efficient and economical cleanser bears testimony to its distinctive quality and also to the service it has performed and is performing in hundreds of ice cream plants the country over.

"Wyandotte Sanitation" is standard. The sweet, wholesome, sanitary cleanliness it produces is definite protection to quality Ice Cream.

It cleans clean.

Indian in Circle

in Every Package.

THE J. B. FORD COMPANY Sole Manufacturers Wyandotte, Michigan

illustration shows the C-T driving axle complete, the component parts of the driving unit and how it is assembled.

Bridge Construction of C-T Frame.

The familiar bridge type of construction has been utilized in the C-T frame. Truss rods running from the frame to the corners of the battery cradle support the main frame members in the same way trussing supports the stringers of a bridge. This design makes the battery cradle integral with the frame and makes it possible to cut down the size, and hence the weight of the frame members, providing an unusually light but rugged construction.

The C-T Controller.

The C-T controller is placed around and forms the base of the steering column, where it is easily accessible for adjustments or repair and where it is out of the driver's way and does not interfere with loading space. It is operated by a small wheel directly under the steering wheel at a point most convenient for the driver. The controller is designed in such a way that the switch fingers will not readily create arcs and burn out.

C-T Plant.

The plant of the Commercial Truck Company is located in Philadelphia and service stations are operated in the leading cities of the country, where a complete stock of parts is maintained and prompt, reliable service given at all times.

* * *

Milburn Electric Trucks.

Simplicity of design and interchangeability of parts, within practical limits, have been aimed at and carried out to a marked degree in the Milburn trucks, models 43, ½-ton capacity and 40, 1-ton capacity. In this way the all important matter of maintaining continuous and economical service has been amply safeguarded.

* * *

Unit Power Plant.

For instance, the power plants in both trucks, including motor, controller, resistance and motor brake, which are assembled together as one unit, are interchangeable and can be easily and quickly removed from one truck and placed in the other, by simply removing a few bolts.

Before buying a boiler do not fail to investigate the superior merits of the famous

Leffel Scotch Marine Boilers

built by this company for over 40 years in a variety of sizes from 6 H. P. to 100 H. P. and to meet all requirements of the different State Boiler Laws. This boiler is confidently offered as meeting in fullest measure and most satisfactory manner every requirement of the trade, as amply proven by the large number of pleased customers using them for many years.

This is a great advantage to all users and particularly to fleet operators; it reduces spare parts stock and carrying charges.

* * *

Kelland Electric.

In the design and construction of the Kelland electric every effort has been directed toward simplicity, durability, reduction of unsprung weight and increase in efficiency. Moreover, no radical or unusual features of construction have been incorporated in this model in the endeavor to secure these features. Only well established and standardized principles, readily understood by the average garage mechanic have been employed. All illustration in point of the extreme simplicity of the wiring system.

Other features of construction worthy of note are: Reduction of weight without sacrifice of strength; elimination of heavy steel underslung battery compartment with provision for placement of battery in body partly under driver's seat, where it is not only more accessible but permits of greater road clearance; double reduction straight line drive which has reduced to a minimum the transmission of power through universal joints, thus decreasing current consumption and increasing daily mileage; rear spring construction which is such as to take the drive through the springs. These springs are also reinforced by a sturdy spring bar, eliminating troublesome radius rods.

* * *

Lansden Electric.

Lansden electric trucks, built by the Lansden Company Inc., Danbury, Conn., are pioneers in the industry. The first Lansden electric truck was built in 1904 for the Adams Express Company, and after eighteen years of daily money making was finally retired in 1922 by the American Railway Express. That first Lansden electric gained wide fame as "Adam," the ancestor of the 1,500 electrics now operated by American Railway Express.

The product of the Lansden Company embraces a range of capacities from 1,250 lb. to 5 ton and two types; the Centurn model, a double reduction drive, and the Marathon model, a heavy-duty chain drive.

* * *

The O. B. Electric Vehicle.

The O. B. Electric Vehicle, manufactured by O. B. Electric Vehicles, Inc., Long Island City, N. Y., is a member of that family which stands for economy, safety, and service in transportation within a radius of 50 miles.

Two predominating features of the O. B. Electric are ease of power, application, and transmission resiliency. One of the factors of greatest loss in operating machinery of any kind is incurred by the shock of starting and stopping. Life is considerably increased by eliminating this factor.

* * *

Walter Electric.

Walter electric trucks are made in the heavy duty models of 7, 5, 3 and 2 ton capacities, and delivery models of 1 and ½ ton capacities.

The delivery models are made with a special patented battery arrangement and frame construction. The batteries are divided into two sections and assembled in two narrow trays mounted on each side of the frame. Because of the position the batteries are very accessible and they can be flushed without shifting. When conditions require operation over routes of exceptional mileage, the discharged batteries can be easily and quickly pulled out and fresh charged batteries mounted in place, in this way doubling the radius of operation. With this construction there is ideal weight distribution because the center of gravity is very low and there is a greater proportion of weight on the rear drive wheels, thus insuring proper traction even for wet, icy, or snow covered roads.

The weight of the batteries is taken directly by the spring hangers of the front and rear springs, in this way relieving the frame members of usual strains due to battery weight. The frame construction is therefore very simple, light but exceptionally strong.

This battery arrangement provides a very short overhang length, permitting of a short turning radius. The chassis level is very low, being 26 inches under load. This low level facilitates quick entry and exit of the driver, which is desirable in frequent delivery service. In spite of the low chassis level the clearance under the batteries is greater than with the old types of battery compartment construction.

... A DEPARTMENT Intended to Assist the Manufacturer in Bolstering Up the Weaker Links in the Chain of Distribution

ADVERTISING THE FOUNTAIN TO COLLEGE STUDENTS.

College students like their advertising snappy. The O'Neil Dairy Company of Ames, Ia., in the college paper of the Iowa State University runs a picture of the sun and a brick of ice cream with:

"Old Sol Is Losing Out! O'Neil's Velvet Brick Ice Cream made him take the count! Order now from a pleasing selection of different flavors and ices."

The Best Ice Cream Company, of Syracuse, N. Y., suggests to the students of Syracuse University, through their college paper:

"Fruited Sherbet in Ramekins Decorated.

"This attractive new novelty in frozen desserts has proven itself to be one of our most popular individual services.

"Delicious, fruited, frozen punch decorated with whipped cream, cherries or nuts."

The decorations of the Onondaga Shop (the candy shop connected with the Onondaga Hotel) form a feature advertisement to Syracuse University students:

"In tones of blue, with service planned for folks like you.

"This leads up to the fountain service, luncheon specials and salads and sandwiches to take home."

Students at Syracuse University are addressed in shop talk by the Syracuse Ice Cream Company through the college paper:

"Learn this for today's little lesson:

"It really isn't a bad idea to get as much as you can out of your college course. You will be glad when you get through if you make it a point to learn a little something every day!

"For instance, learn today that Syracuse ice creams are the most refreshing and satisfying you can get.

"Whether you order in quantity over the phone for some special occasion, or over a counter for a treat for yourself, be sure that you get Syracuse ice cream. Ask for it by name."

A SALES TALK ON ICE CREAM.

From a Letter Issued by W. P. Abel, of The Impruv-Mix Co., New York.

A greater ice cream industry makes its start in your plant. Consider yourself a factor in the advancement of ice cream as a national industry. You strengthen the industry, hasten its expansion and create a greater demand for the "national dish" by raising and maintaining quality.

"Quality and profits are synonymous in the ice cream industry," says The Ice Cream Review in an editorial. (See page 4, May, 1923, issue.)

We have found that quality—volume—profits go hand in hand. Your success, as ours, is in presenting a

product of real merit—supreme quality. Most important in selling the dealer, is to reach, secure and hold him, by having your product make an appeal to the consumer. Create a desire for your ice cream and that preference keeps him sold. Quality ice cream, therefore, sells both the dealer and the consumer.

HERE'S AN IDEA.

By J. M. Antrim, Vice-pres., Furnas Ice Cream Company, Indianapolis, Ind.

We have one druggist in this city who is using a very model scheme with wonderful success for the sale of ice cream and soda. He has an excellent location on one of the main boulevards and just completed a new drug store, which I think is as fine as any in the United States.

His building sets back sufficiently far to allow him to decorate with flower beds and potted plants, and in this space, of an evening, he places tables for the accommodation of his customers. He has perhaps 18 or 20 boys to wait on what he calls his "Curb Service." Immediately upon the arrival of an automobile, their orders are taken and they either sit in the machine, go inside the store, or sit at the outside tables.

He has enjoyed a most wonderful business, as this form of service seems to attract the thousands of automobiles that pass his door each day and evening. We believe that anyone who has space capable of taking care of a like proposition would do well to follow up his ideas. Any location where automobile traffic is heavy will profit greatly by following an idea of this kind.

He is very particular to see that the best of everything goes in the make-up of his products and combined with the very active service that he gives, has certainly been a winner for him. He has also made his place attractive in the day time by using the Beach Umbrellas over the tables.

VOLUME RESTS WITH THE DEALER.

By a Florida Manufacturer.

I have come to the conclusion that practically all of the development of more volume in sales of ice cream rests with the dealer. If we can create salesmanship among our dealers and their employees, the ice cream will be sold.

I had two or three striking examples of that this season. One dealer who took a fountain that was practically doing no business immediately increased his sales nearly 200 per cent, and when I went over to investigate I found it was simply salesmanship, everybody in the

TRUE ECONOMY

Patented Nov. 14, 1922
Cut illustrates No. 825 and 8210 sizes

It is sometimes difficult to determine just what is true economy but not in the case of ice cream cabinets.

Here true economy lies in the ice conserving factor and the ability of the cabinet to stand constant usage over a long period of years. It is these attributes which have won for Grand Rapids Cabinets their high standing in the trade.

Manufacturers who furnish their customers Grand Rapids Cabinets have the satisfaction of knowing that in this particular matter they have done their utmost in the way of service.

hope some of the manufacturers will be able to give me an idea as to the manner in which this salesmanship spirit can be developed in our other dealers. Up to this time I have been unable to get much co-operation along this line.

Creating Business for the Dealers

Southern California Ice Cream Manufacturers Successfully Blaze Co-operative Advertising Trail

YOU can't put Southern California ice cream, as good as it is, in cans and ship it to Massachusetts or Japan or England. So when the foremost ice cream manufacturers of sunny California reached the point where their territory extended from beyond Santa Barbara to Mexicali, Mexico—from the Pacific to the desert, the only possible increase in ice cream sales that could be hoped for was increase due to larger consumption by the public. Every conceivable place that could sell ice cream had it for sale. The only growth in gallonage was a natural growth due to increase in population. The market as far as dealers was concerned was saturated.

Increasing consumer demand was the only answer, which meant taking the story of ice cream direct to the public. And this, in turn, meant that the manufacturers must do the advertising usually done by the retailer in other lines of business to benefit himself.

So then the far-sighted manufacturers of this district, to expand themselves, must create business for the retailer and for the smaller manufacturers who cared nothing for the future of the industry. Some few took the old fashioned selfish attitude of caring nothing for the development of the industry as a whole. If someone else increased the consumption of ice cream, they would get their share of the new business whether they paid their pro-rata of expense or not—so why pay?

The Crescent Creamery Co., the L. J. Christopher Company, The National Creamery & Produce Company, Alfred's Pure Ice Cream Company, Hughes' Ice Cream Company, The Globe Ice Cream Company, of Los Angeles, and Imperial Ice Company, of Santa Monica, Excelsior Creamery Company, of Santa Ana, and San Pedro Creamery Company, of San Pedro, raised an appropriation based on the gallonage of each member manufacturer. This appropriation is much smaller than what the individual ice cream makers would have spent in scattered advertising.

* * *

Family Brick Advertising Campaign.

FIRST came a campaign advertising "Family Brick" ice cream, running from November 1 to January. "Family Brick" ice cream is a trademark name covering the individual manufacture of each member factory; all plants making the same combination of flavors each week. No need to explain that this campaign proved much more successful than one splitting the same appropriation into nine or ten small individual efforts attempting to push different bricks. "Family Brick" ice cream soon dominated the field, and is now selling at the clip of four hundred per cent increase over all previous brick sales.

Beginning January this year, an educational campaign on "Ice Cream is a Food" was added to the "Family Brick" advertising.

Such a campaign without the price argument and without the novelty appeal of a new product, is usually

regarded as a rather slow process, but results so far have exceeded all expectations. Each member of the combined advertising campaign reports the best spring ice cream business ever enjoyed. The increase over last year averages around one-third, in spite of the latest summer in California in years. With immediate results so gratifying the cumulative power of this advertising is expected to yield remarkable returns this summer and throughout this winter.

You will notice that this advertising ran throughout the winter, and while the California winter season is famous—ice cream sales fall off here at this period just as they do elsewhere.

* * *

Making Ice Cream "Queen of Desserts."

THE ice cream industry has spent forty years creating ice cream queen of desserts. The appetite appeal has been the principal appeal. Today you cannot find one person in a thousand who does not enjoy ice cream. How few times have you heard someone say, "I don't like ice cream." Yes, the attitude of everyone was that ice cream was a mere dessert, a luxury, to be eaten for enjoyment only.

In the southern California advertising great care is taken not to tear down this reputation; if anything, it is religiously built higher, at every opportunity. Yet, no matter what appetite or other appeal is employed, the key note of all is, "Ice Cream is a Food."

Newspapers were selected as the backbone of the campaign. All Los Angeles papers and one paper each in San Pedro, Santa Monica and Santa Ana being used.

A change in pace of copy was carefully observed. "Ice Cream is a Food" has been proved in this advertising in such various ways as to convince each and every class of people; the deduction has been arrived at in every possible way between popular circus style and that of the highest kind of high-brow grand opera. Everyone likes ice cream—its appeal is universal. There is no age limit.

Starting the educational campaign a series of ads based on cold, hard facts were run; comparisons in food value backed up by authoritative proof from government reports findings by nutrition experts, etc., was presented in an analytical form. In addition to this, six forty-inch ads was devoted to the scientific analysis of the component parts of ice cream.

* * *

Advertised Ice Cream to the Housewife.

BOTH "Family Brick" and bulk ice cream were merchandised through a long series of ice cream recipes, inducing the housewife to buy ice cream as a basis ingredient for many dishes; just as she buys flour when she desires to make a cake.

Complete dealer advertising display on "Ice Cream as a Food and Family Brick" was prepared. Wagon banners, awning strips, fountain and window strips,

fountain hangers and cards, etc., were made to be placed by the individual manufacturer at this "stops."

The entire campaign is sold direct by mail and through trade papers to the dealers. An ice cream recipe book and a scientific study in booklet form of "Ice Cream as a Food" for babies, children, convalescents, nursing mothers, the aged and the normal individual is being prepared for direct distribution to doctors, nurses, home economic teachers, the housewife, etc.

The content of milk fat in ice cream is set by state laws, and its principal ingredients are pure rich cream and fresh eggs, yet it was ascertained that in several instances ice cream was classed with cheap candies and "trash" by Parent-Teachers' Associations governing school cafeterias. Which shows two things very plainly. First, the need of the above educational work and next, the disrepute into which a food product can fall by the neglect of constructive advertising. Ice cream advertising consists in far more than buying expensive, beautiful cutouts and "putting an ad in the paper" (in the summer time) saying, "Eat So and So's Ice Cream."

Wall space and bulletin display also are being used.

The "Grosse Plan" has been so impartial and so tied in with the practical, every-day activities of the manufacturers—the returns to each manufacturer have been so exactly in proportion to the expense incurred, that today the campaign has lived over the troublesome doubtful period so peculiar to co-operative advertising plans and is an assured success.

The ice cream manufacturers in southern California have satisfactorily answered many big questions over which the rest of the ice cream world are still wrinkling their brows.

Harry F. Grosse, who directed the advertising campaign, has recently been elected secretary of the Cali-

fornia Southwestern States Ice Cream Manufacturer Association. He states that inquiries from all over the country have come to him regarding the organization and details of the combined advertising. San Diego manufacturers have recently duplicated the campaign. He will continue his work for the Los Angeles group in addition to the new honor.

DEALER BULLETINS.

The New State Ice Cream Co., Oklahoma City, Okla. issues a peppery little bulletin to its dealers, pointing out reasons why they should endeavor to push the sale of ice cream. In addition to other features, an issue mailed to this office contains a comparison of the food value of ice cream to the value of other food products enabling the dealer to tell his customers actual reasons why more ice cream should be eaten.

A SALES PROMOTION MENU.

A new type reversible sign makes it very easy for the ice cream retailer to change his fountain menu. One flavor gives out or another is added. As shown in the accompanying illustration, the panels operate independently, and on the back of the panel reading "vanilla" appears "orange ice," and on the opposite side of "eskimoe pie" is "brick dessert."

FRONT

BACK

This reversible flavor board also is arranged so that different sales suggestions can be mixed in with the ice cream menu. For instance, a single turn can take the word "chocolate," when that flavor gives out, and leave in its stead the line "Eat a plate every day." This line appearing under the word "vanilla."

Other slogans mixed in with the menu are: "Is nourishing," "ice cream is a food," "take home a quart," "the dessert supreme" and "Be sure it's—the name of the manufacturer appearing on the back line. They are sold for a dollar a sign. The name of the manufacturer will be furnished upon request of The Ice Cream Review.

Why a Catering Department?

Answers to Some Questions that have Troubled Ice Cream Manufacturers. By MILES D. ALLEN*

MANY an ice cream manufacturer is constantly asking himself the question, "Will it pay me to establish a catering department within my own organization to take care of catering and special orders which I receive through my wholesale dealers?"

This problem confronts every ice cream manufacturer, and it will be the purpose of this article to discuss the problem and show several outstanding advantages of such an organization in connection with ice cream making.

First of all, it is not necessary to establish a com-

frozen ice cups, catering ice cream in a variety of flavors and designs, individual ice cream moulds in many shapes and sizes, suitable for any occasion, water ices, sherbets and punch.

With this group of special desserts to start, you can add baked goods, such as ice cream pie, sultana rolls, special puddings, spun candy baskets, ice cream cake, log cake, wedding and birthday cake and individual cake. After you have started making these special desserts, enlist the aid of your dealers and allow them a generous commission for their trouble in taking orders.

modious and expensive display room to exhibit your catering subjects. There is an advantage in a display room, but additions and betterments can be added after the department has proved its worth as a business builder, and you feel that the added expenditure is justified. Ordinarily, a room in your ice cream plant can be conveniently set aside for a catering and special order department where dainty ice cream moulds, frozen desserts, etc., can be made with special care and attention.

If the business is large enough, an oven and a kitchen should be installed to care for your baked goods and cakes, and special cakes for use with ice cream. The following frozen desserts can be made without the use of a chef and kitchen, however, and will prove business-getters and aid in building up your special order department. Melon moulds, ice cream baskets,

In this way you can work up a very profitable side line as an adjunct to your ice cream business.

Now, as to the best means of advertising such a department. This question is one to conjure with. In the case of most of the successful concerns, however, the following plan of advertising has been found the best—to stimulate sales and to build up prestige for the concern a direct mail campaign to the prospective customer enumerating the advantages of such a catering service, embodying the principal idea that the details connected with entertaining guests are too annoying for the hostess, and she should employ the services of expert caterers who know all of the finest details of proper entertainment and service.

A booklet describing your catering service and a retail price list are absolutely essential. Small attractive but inexpensive brochures can be published to supplement the catering booklet and price list and many of

NORTH, EAST, SOUTH AND WEST—"REVIEW" IS LIKED THE BEST.

inal ideas will suggest themselves to the wide awake ice cream manufacturer.

The wholesale dealer should be paid particular attention to by the manufacturer in order to make him an enthusiastic booster for the catering service. He should be given an abundant supply of booklets and price lists and the manufacturer can be of invaluable assistance to him in securing a live list of prospects in his particular neighborhood for circularizing. The dealer must be made to become enthusiastic and be shown how he can make an added profit by soliciting such orders. Many dealers send out personal letters to their customers reminding them of several events for which they should use catering service.

A letter written by a dealer, and published in the "Southern California Retail Drug Journal," is particularly good and will give the reader a typical illustration of how one dealer tied up with his manufacturer on catering orders. The letter is very brief—here it is:

To the Parents of Wm. Ames:

Away back in the days when I was William's age I remember the preparation made for my "7th" birthday. Mother did the baking of pies and cakes, while sister insisted upon having some fancy salad stuff; she should have known better—kids don't like salads. Parties to kids of our age meant pies and cakes and ice cream—particularly ice cream.

This great day came and when I awakened that morning our little middle West town was snow laden. All morning we hoped and prayed for sunlight, but as noon came the weather became more severe and none of the children came. That was the most disappointing day of my life. I am sure William will remember for a long time his "7th" birthday—particularly if you call on us to supply the ice cream, not just ordinary bulk ice cream or brick ice cream, but assorted animals in different colors.

The cost is so small and the kids will be so pleased with each little ice cream animal that I know you will be as delighted as they. Just drop in and talk it over with us. We have a catalogue and you can pick just the kind of animals to suit them best.

Very truly yours,

STAR DRUG COMPANY.

Attractive catering display posters for the dealer's windows are also absolutely essential and should be distributed with care and thoroughness among your best dealers. Too much attention cannot be paid the dealer for he is the most important link between the manufacturer and the ultimate consumer.

Catering dummy moulds to be used in window trays should be circulated among the better dealers, as it is possible to check definite results from these displays, and they prove very valuable. Your dealers will soon call on you for such displays when they see with what popularity they are received by the public.

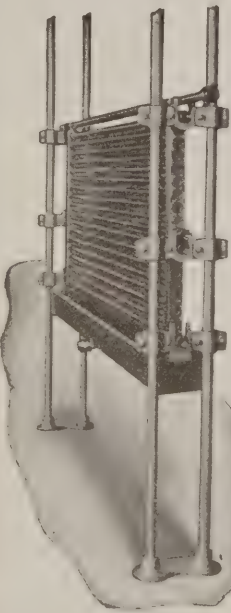

The advantages of a catering department are many and varied, but probably the most important one is the matter of prestige, good-will building—most people associate a creamery or an ice cream plant with milk and its allied products, and it seems that the thought of these products does not always convey the best impression. It is here that the catering department can put a sledge hammer blows to build up prestige and a fine association for your products. The high quality association of a fine catering department is bound to have a beneficial influence on your entire business.

Patrons of your catering service if pleased will gain a lasting and favorable impression of your concern and will probably talk with others, thus the good work goes on helping to build up prestige, and a high quality association. Many an ice cream manufacturer sees enough advantage in gaining prestige and good-will through his catering department that he is satisfied to let it pay for his overhead only and be content without a profit. If a definite loss is incurred through the establishment of such a department during its infant stages the loss can very logically be charged to advertising, for a catering department is the best builder of good-will and prestige that an ice cream manufacturer can employ.

Ice cream men all over the country are coming to realize the very evident advantages of such departments and are making investigations relative to establishing such organizations in their own plant. After noting the many manufacturers who are conducting successful catering departments, it is only logical to think that there must be a good reason for such a move. The good reason is that catering departments pay big dividends not only financially but in establishing a wonderful and lasting prestige for your concern.

Don't be without a position, when at a small cost you can locate one through the Want Department of The Ice Cream Review.

DUNN'S CELEBRATED EDIBLE GELATINE

COMPLIES WITH ALL STATE AND FEDERAL PURE FOOD LAWS

THE mammoth Ice Cream Industry of today owes more than the average manufacturer appreciates to the founder of our firm, the late Mr. Thomas W. Dunn, who was instrumental in overcoming difficulties which beset the manufacturer of Ice Cream. These difficulties were eliminated by the introduction of GELATINE into the mix.

DUNN'S EDIBLE GELATINE

is today an important ingredient of Ice Cream, because not only is it a stabilizer, but it adds to the Food Value of the finished product.

THOMAS W. DUNN COMPANY, 546 Greenwich Street.

Way down South in Dixie

SUPPLYMEN are natural boosters, but the average road agent for ice cream supplies is very dependable in such a matter as how much trouble he is having selling goods. For the supplyman, sublimely optimistic though he is ordinarily, loves his orders just as a ball player loves his base hits—and is cheerful or peeved accordingly.

People who have for some years followed the fortunes of the Southern ice cream industry, from stationary observation, are amazed at the optimistic predictions today of supplymen who were frankly discouraged over the situation a few years ago.

Salesmen from the South who used to call on us with an "all is lost" expression on their faces, now are telling everybody that things are doing very nicely in Dixie, and the future looks bright.

The supplyman's views carry much weight. He gets a pretty large picture of the situation in his mind.

A GOOD price for cotton is the big reason for the good business conditions prevailing in the South at this time. The coming fall should find the farm situation even better, since the cotton acreage still is comparatively low and farmers have learned much about combating the boll weevil. At the same time more food-stuff has been produced, giving the farmer something to eat, and leaving him free to spend his money for other things. The dairy cow is doing a little good. Not much, but a little.

CONVENTION calls struck the ears of Southern ice cream manufacturers while business was at its highest swing. The late spring opening delayed the production peak, but there is every reason to believe that there will be considerable of a "follow through."

A late spring generally means a later winter unless the epidemic of volcanic eruptions disturbs the weather scheme as some learned gentlemen believe will be the case.

However, there is more than one reason to believe that the Southern industry is in for a protracted period of activity, judging by reports reaching The Ice Cream Review of continued heavy buying of supplies.

There is yet time to talk of the convention menu of the coming winter months. But now reports of the approaching National Exposition at Cleveland, the Southern convention at Little Rock, the Oklahoma convention at Tulsa, the Texas gathering, etc., are just gentle suggestions of good things to come in the sweet bye and bye.

THE dates have been selected, committees are getting to work, and in a little while the stage will be all set for the 1923 convention. How swiftly things move! It seems such an incredibly short space of time since the genial "Mike" Costa took the gavel from the hands of the equally genial W. W. Campbell at New Orleans and started on his business of presiding for the year.

Of course, some four months or so are to pass before the Southern clans actually gather at Little Rock, but there is much work to be done in this time. Conventions committees must take off time from their business and gather up the loose ends here and there, and supplymen must get in their work boosting the convention.

It is a little early to make any serious review of the work of the present administration, but even now enough has been done to make members of the "Southern" feel very well satisfied about "the lay o' the land." Progress has been made on such matters as standard of ethics, sales promotion, etc., and there is no doubt that something of real interest will develop at New Orleans in this connection.

ADD another achievement to the already long list of the North Carolina association. Success has come to its efforts for pasteurization regulations. The Carolinians take their association work seriously. Other associations will do well to take lessons from them. Every member is a member throughout the year—not just at convention time. Officers and members maintain close personal contact, and there is splendid understanding.

WRITING in this issue, James J. Harvey, dairy and ice cream sales manager of Bessire & Company's southeastern branch, tells something about the progress made in dairying in the South. He is especially well acquainted with the situation in Georgia, where much progress is being made. Although many are agreed that it will be many years, if ever, before the South reaches equal footing with the great dairy states of the North, it must be admitted that a state that could increase its butter annual output from 25,000 pounds to 969,000 pounds, in two years, is certainly making progress. Mr. Harvey's story is very interesting. Read it.

MANY Southerners are looking forward to the Cleveland Show. Good things are promised.

Do You Need a Refrigerator Body Very Quickly?

1,000-gallon Baird Refrigerator Body on a 3½-ton Truck

In addition to making the best refrigerator bodies in the world, we render the best *delivery* service in the world in this field.

Realizing that just at this time of year ice cream manufacturers who need new delivery bodies need them *promptly*, we have provided a special construction and assembling crew and can fill your order in from *ten days to two and one-half weeks*, dependent upon the painting required.

In the various features now required in ice cream refrigerator bodies—perfect refrigeration, lightness, durability and moderate price—Baird Bodies have this year proved their superiority notably.

Coupled with this rush-delivery service, Baird Bodies represent the best investment for equipment of this sort that ice cream manufacturers can possibly obtain.

Southern Convention Preparations go Forward

PRELIMINARY preparations now are being made for the eleventh annual convention of the Southern Association of Ice Cream Manufacturers. Southern association officials now are deciding upon the various committees, the personnels of which will be announced some time this month.

Little Rock was selected as the scene of the convention at the close of the New Orleans session. The convention will be held December 4, 5 and 6. Marion Hotel will be convention headquarters. As accommodations are limited in the convention hotel it is advisable to make early reservations. The Capitol Hotel, near the Marion, offers good accommodations.

While Southern association officials are pondering preliminary arrangements the Arkansas association is keeping a pace ahead. As this issue is about to go to press arrangements are being made to hold a meeting of Arkansas manufacturers at Little Rock to work out some plans for their role as hosts. It is no court secret that the gentlemen of the Traveler state are taking the coming convention very seriously, and while the Ar-

kansas officials are modest in their statements at the time, it is easy to see that they are moving with determination to make the Southern manufacturers' visit to their Capital City one of the most enjoyable of all past conventions. Although Little Rock has not the glamour of quaintness offered by New Orleans, it has many attractions of its own, being one of the progressive cities of the South, and the capital of one of the South's most rapidly developing dairy states.

After all, a successful convention is the aim of all. With such great promise of the earnest co-operation of Little Rock manufacturers, there is every reason to believe that the 1923 session will come up to all expectations.

No announcement has been made as to an exhibit by the Dixie Flyers, but it is thought that some steps in this direction soon will be forthcoming. At any rate, members of the Dixie Flyers will be sure to give to the coming convention their strongest support and encouragement. President Mortensen will waste no time in getting his force in action at the proper time.

How We Can Best Serve the Public

By B. G. ANDERSON*

SERVICE is of many kinds and of many different grades, the highest of course, being the absolutely unselfish service advocated and lived by the Great Teacher, and perhaps best expressed in the words: "He who would be first among you, let him be servant of all."

If service is the keynote of successful living in the sense emphasized in the above quotation, it is no less true in the field of ice cream manufacturing, that he who would be first among ice cream manufacturers must be the servant of the public.

But, to be more specific, as is true with any other business, conventions and customs dictate that we must be selfish to a certain extent, and this condition, coupled with the ideal of service mentioned above, brings us to what I conceive to be the ideal of the ice cream business, and that is, in serving the public, to first be true to our own legitimate interests. These interests are a healthy profit and an unquestionable reputation for honest goods—both are necessary.

No business can be a success in serving the public—in giving to the public some commodity that makes for health and pleasure—which does not make for its owner his livelihood; truly, the laborer is worthy of his hire, and just as soon as we begin to dispense our goods without a reasonable profit, just that soon does our bark strike financial rocks, and just that soon is the quality of our service lowered. This rule is an axiom in any business; our business is no exception.

Stand For Honest Goods.

Therefore, let's stand for a reasonable profit, but not for that alone; let's also stand for honest goods.

THE ICE CREAM REVIEW, Milwaukee, Wis.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

In no other business can this be more important than in ours, and partly because children are large consumers of ice cream. A shoddy suit of clothes may hurt a child, but poor ice cream will.

Let's make goods of integrity. Let's so conduct ourselves that membership in this Association means to the person who purchases our products that he is getting something all wool and a yard wide; something that the retailer can put over his counter and say to his customers: "This ice cream is made by a Member of the Mississippi Ice Cream Manufacturers Association, no matter which one of them made it, it is good. No member of this Association puts out anything else."

Is it not true that we are looking for success?

Value Counts.

I think so. And what has been the most noticeable thing about the success of the great manufacturers of America? Pardon my calling the names of a few. Tiffany, I am told, does not get out an illustrated catalogue, but the short description in the Tiffany Blue Book is a more accurate guide to the customer than reams of colored page advertising.

A Tiffany diamond is what the Blue Book says it is. What does the name Eastman mean to you on a Kodak, or the name Winchester on guns, or ammunition; and what does Colgate mean on toilet preparations? In all these questions the quality of the products of these manufacturers, and you must agree with me that good value has been the greatest factor in their success. These people serve the public by giving value at a reasonable profit. They are true to their profit; they are true to the reputation of their goods; in being thus true to themselves, they make a happy and better served public, and we can do the same. Shakespeare was talking to us all when he said: "First, to thine own self be true, and it then follows as the night the day, that thou can'st not be false to any man."

6' Vacuum Pan at Wellington, Ohio, plant of
Telling-Belle Vernon Company,
Cleveland, Ohio

THE TELLING-BELLE VERNON CO.

CLEVELAND, O.

EXECUTIVE OFFICES

September 23rd, 1922.

C. E. Rogers & Sons,
Detroit, Mich.

Gentlemen:

We take pleasure in saying that the Rogers condensing pan installed in our new Wellington plant is a great improvement over the pans heretofore used. We find that we can boil at a lower temperature with water at a higher temperature, and with less entrainment loss than has been our experience with other pans. The pan also has a decidedly greater capacity. We are very glad in this way to express our satisfaction with this installation.

Yours very truly,

THE TELLING-BELLE VERNON COMPANY.

A handwritten signature in dark ink, appearing to read "J. H. Cassidy". Below the signature, the words "Vice President." are printed.

LARGE SOUTHERN PLANT FORMED.

Organization of the Lone Star Creamery Co., a Houston, Tex., firm, with a capital stock of \$200,000, was announced recently in a newspaper advertisement. The new company has taken over the plants and business of the Magnolia Dairy Products Co. and the Clover Leaf Dairy Farms. It will operate the plant of the former organization and also will use the machinery of the latter.

The company will supply milk, cream, ice cream, sherbets, ices, butter and cottage cheese. The officers are: President, Ralph B. Feagin; treasurer, C. M. Malone; secretary, Sam Suravitz; city sales manager, W. C. Smedes; county sales manager, G. A. Moeller. The directors are: Ralph Feagin, B. A. Reisner, C. M. Malone, Walter H. Wainex and W. C. Smedes.

PASTEURIZATION LAW PASSED IN NORTH CAROLINA.

Efforts of the officers of The North Carolina Ice Cream Manufacturers' Association have finally been rewarded by the passage of regulations requiring all products going into the manufacture of ice cream to be pasteurized just previous to freezing. W. M. Allen, state food and oil chemist, notified the association's officers of this step by the board of agriculture on July 8.

Passage of the bill is the result of earnest efforts being made by the Carolina association in the interest of high quality standards in Carolina. Members and officers joined hands in the undertaking to pass the pasteurization regulations.

WITH THE MANUFACTURERS OF NORTH CAROLINA.

By A. E. Dixon, Secretary North Carolina Ice Cream Manufacturers' Association.

As regards association activities, it has been a great pleasure that the secretary has visited the following cities since the convention at Raleigh: Charlotte, once; Raleigh, three times; Wilmington, once; Hamlet, once; Wilson, once; Washington, N. C., once.

At all these places your secretary was made to feel like "home folks," and official, as well as personal thanks for same is extended to Messrs. Obenshain, Charlotte; White, of Wilmington; Carty, of Washington; Corning, of Hamlet, and White Bros., of Raleigh.

Regional meetings have been held covering Durham, Raleigh, Hamlet and Wilmington. The writer is very glad to state that the Durham situation was adjusted satisfactorily and at the other places, conditions were problems were discussed and, while no definite solution was accomplished, progress was made along the line of becoming better acquainted with each other.

The ice cream business seems to be in a flourishing condition, so far as volume is concerned, but poor regarding wholesale prices. Return of tubs is somewhat better than last year, but still very unsatisfactory. Dealers do not hesitate to make requests for anything and to refuse shipments on the least provocation. The industry is becoming so highly competitive, steps must be taken for closer co-operation, and the only way to do this successfully is to have full CONFIDENCE in the other fellow and act so he will have the same in you. This can be accomplished by having regional meetings with LESS TALK AND MORE ACTION.

The secretary will be glad to attend any meetings desired, and will go anywhere in the state when called. Prices are gradually in the ascendancy, but are still far from what they should be. Certain sections are practically demoralized by compound manufacturers selling their product as ice cream. As far as the writer is able to observe, the time and field are ripe for ACTION.

SCHOTTMUELLER IS SOUTHERN REPRESENTATIVE.

H. E. Schottmueller, recently of the Carpenter Ice Cream Co., St. Louis now is associated with The Dairy Corporation, Chicago, as Southern representative, according to recent announcement.

Send news items and personal notices to the "Review" and see how well they look in print.

ON THE ICE CREAM TRAIL IN TEXAS

TEXAS LONGHORNS

President—J. B. HUFF,
Prall-Huff Co., Ft. Worth, Tex.
Secretary—H. B. COX,
Parker-Brawner Co.,
Ft. Worth, Texas.

With F. E. ROBINSON
A. H. ANDERSON
("The Mississippi Valley Twin")

HOUSTON, TEXAS.—Yes, fellers, this town is on the map insofar as ice cream manufacturing is concerned. There is no secret attached to it—in fact, we will let you in on it. Our mutual friend, Mr. Sullivan, of the Houston Ice Cream Company, has placed this city on the map, and if good ice cream means anything this town will stay put.

Congratulations are in order for the president of the Texas Ice Cream Manufacturers' Association for the modern plant he has just built. It never rains but what it pours. This is what the double-shift operators tell us in his freezer-room—that "ice cream continually pours from their freezers." And perhaps you will wonder what it is all about? Sullivan's ice cream can hardly be made any better.

By heck, you can't fool us, we ate some.

* * *

Shreveport, La.—We held a foursome in this s'port town and, of course, it is always good weather when four good fellers get together. "Bill" Campbell, Byron Morris (the Heavyweight Creamery Package Representative), Andy and Robbie all answered present.

* * *

A camel can go eight days without drinking, but who the hello wants to be a camel? Our friend Bill says he drinks every day—water, of course, and also eats a plate of ice cream. We checked him up on this and found him to be in balance.

We ate quite a bit of Bill's ice cream, which was very good. "Pardon our gloves, we thought we were at a banquet." No doubt our presence had some ill effect on his over-run that day. We don't come often, but when we do we sure do take care of the cream. There is only one fault with Campbell's ice cream—it has that **Morish** taste—the more you eat the more you want.

Everyone on the Oasis knows Bill has the stuff—and, yes, he is the only "Campbell" this sime of the pyramids making ice cream. What do you know about that? Larry, turn the crank!

* * *

Dallas, Texas.—Who said let George do it? You all know George Boedecker. He says let the meat balls

roll, he can take care of them. Business was better since Christopher Columbus left America. "Old Cris" known his eggs like Friend George would have parked his car in Dallas and won fame.

Of course, every one does not fit in this cold which is a frozen proposition, but remember George wears his tortis-shell spectacles and does not miss anything.

Boedecker spells the very last word in ice cream manufacture. Ask the Dallasites, they will tell you that all good things come in small packages. George says his package business is also very good.

We understand Mr. Boedecker lost a customer a week—yes, too bad—he died.

* * *

Mineral Wells, Texas.—Where did the Sons of the Fourth (July, of course)? In Mineral Wells, Texas. When you need a drink, crank your Ford and get it that way. Crazy water is aged in the woods and bottled in the barn. The Royal Northwest mounted never in the town. Why should we pass up the springs. Appreciate these small town hotel bunks are—all without springs. A spring will aid your rest, when you are at your wits' end.

Andy has a wave in his hair. While in Galveston we had a dip in the ocean and a wave slapped him. Too bad this happened. They say it will be permanent.

Glasses—why we wear nothing else but. Some of them sun glasses others drinking glasses. What is the difference? Absolutely none, Mr. Gallagher. Position not, Mr. Shean.

* * *

Friend Taylor still has his shingle out, it reads, "Taylor-made Ice Cream." The fit is guaranteed; the more you eat the more you weigh. Mr. Taylor is identified with a plant in Weatherford. Miss Taylor, manager of this plant and say, fellows, she is a good Taylor for the has all this business sewed up.

* * *

Forth Worth, Texas.—"Polly says"—Eat Polly's ice cream. You can't fool Polly, for we have seen her all over Fort Worth. This covers some territory; are you following us? Why question Polly—it is the dry land surrounding this town crackers would be more binding.

* * *

The Long-Horn who does not know W. W. Wren may be called a bird who has not flown into the Old of White Caps. Yes, he has no bananas. The present in San Antonio will say he served oysters instead. Friend Wren advises us that the dog died. Perhaps some of you fellers will now be able to get a taste out of your mouth.

Your mouth never puckers up when our friend Wren serves you Alta Vista Ice Cream. Don't know what this Polish name means, but the taste of his product spells volumes. He advocates "Eat a Plate of Ice Cream every day."

U. S. Heavy Duty Freezers

Offer Improved Open Head Construction

New Front End Construction of U. S. Heavy Duty Freezers

Note the New Fruit Hopper with its hinged lid, the Patented Removable Bearing and Tripod Support, Independent of Cover, for front end of Whipping Device, and, incidentally, the new U. S. Sanitary Rotary Disk Cream Can Valve. Its housing is cast in one piece with the new cast bronze end of the cream can. It is operated by the lever seen over the right side of the fruit hopper.

You need to lift the cans with fruits and flavors only as high as the top of the cylinder head to empty them into the U. S. Freezer with the New Open Head Construction. Besides, you can rest them comfortably on a solid casting as you turn out their contents, instead of laboriously holding them up in the air for fear of crushing a fragile sheet metal fruit funnel.

The metal fruit funnel has been altogether done away with, and instead, a substantial wide mouthed hopper is cast on solid in one piece with the cylinder head—its rim just above the top of the cylinder head. It is covered by a simple Hinged Cover.

With this new construction, you will find it much easier to take a look into the freezer cylinder to see how the freezing of the mix is coming on. All passages are big and easily reached, so they can readily be cleaned. There are no separate parts to wash. Everything is flushed out together when the inside of the cylinder is cleaned.

*The
U. S. Freezer
A Really
Heavy Duty
Machine*

We Are Ready for Rush Orders

We are ready to make prompt deliveries on any of our very complete line of U. S. Heavy Duty Freezer sizes, including 40, 50, 60, 80, 120 and 160 Quart Capacity Machines. Whether you make ice cream only to supply your own ice cream parlor, or are a wholesale manufacturer turning it out in thousands of gallons per day, we can give you just the ice cream freezer equipment you need quick, should the emergency arise in the heat of the mid-summer rush.

Texas Ice Cream Manufacturers' Association

(Continued from page 56)

is filled with ice water, the milk passes over the outside and runs through a cotton strainer pad into the cans. These strainer pads are easily constructed simply by taking a half yard of cheese cloth 36 inches wide, cut a piece of absorbent cotton about 10 inches square and put on one end of cheese cloth and folding the other end of the cheese cloth over it; this pad is then placed over the milk strainer on top of can directly under the discharge of cooler. The use of these pads gives the farmer some idea of what he had been selling, for these strainer pads catch any foreign substances which might have fallen into the milk. The pads are used only once, and then destroyed.

After the milk is cooled it is held until the truck calls, the truck driver keeps the milk covered and delivers it to the plant between 7 a. m., and 11 a. m. The milk is then sent to the samplers and weighers. First of all, milk is tested by smell for bad odors; should any be found 9c.c. of this milk is taken out and tested for acid and preservatives; should it show that it is not fit for pasteurization it is returned to the farmer. This seems to have the desired results for it seldom happens a second time. If milk is found all right this far a 5cc sample is put in a steril tube and packed in ice for a bacteria test. A pint sample is then taken out for sediment test—this pint is forced through a cotton disc by air pressure, these discs are dried and mounted on a tag; each pay day the dairy farmer gets his daily sediment test, bacteria test and fat test. It is very gratifying to see the farmers comparing sediment test and bacteria test; very little, if anything, is said about butterfat test. The milk, after it is passed and weighed goes to the clarifiers and then to the pasteurizers where it is pasteurized—heated to 144 degrees, held 30 minutes, and cooled immediately to 40 degrees; it is stored in glass lined holding vats or 10 gallon cans, held ready for the ice cream mix.

The 5cc samples with the pint samples are taken to the laboratory, the pints are tested for butterfat while the 5cc samples are used for bacteria plates. Until recently it would take 36 to 48 hours to develop an agar plate in our laboratory, which means that our bacteria counts were always behind two to three deliveries, which is dangerous, for should there be any pathogenic bacterial development the milk would not be stopped until several deliveries had been made.

By using and combining the idea of Doctors Frost, Berg, Eyer and Conn we have worked out a simplified short method of developing bacteria by which means we turn our plates over night fully developed, and in case

any contamination or pathogenic development found we have this patron's milk stopped before it gets in for his second delivery. The simplified method takes up scarcely any room, very little glass work, very little other materials, milk powder agar and two stains are all that is required. We have over 100 milk patrons and were using over 2500cc of agar a day and stacks of petri dishes and pipettes, now using about 25cc of agar and very little glass. With the balance of the 5cc samples a hydrolytic test is made for acidity and the balance is used for colorimetric hydrogenium determination, which gives you the keeping quality of the milk by making hourly comparisons. Five cc of the milk or ice cream sample is dropped into a tube of beef culture with proper indicators, and held in the incubator at 100 degrees for one hour and then compared every hour after to known standards from 6.2 to 7.8 with the use of a color comparator. These hourly comparisons show how the milk and ice cream will keep and stay in good condition by the colors developed, and you know long before the product is on the market just what it is. If there are any faults in your process these methods will locate them for you and you can locate and correct them before the same trouble can happen to another mix.

The bacteriologist and the sanitarian today know before the ice cream is offered for sale its composition, bacteria count and its keeping quality. The ice cream manufacturer will have a well equipped laboratory which is going to be just as essential as his hardening tank and the ice cream freezers. These laboratory methods are inexpensive and are time savers, so when all is said and done the manufacturer must know his product from the producer to the consumer.

Now this little incubator I have here we have had for years and it is handy and you can carry it around with you and you can see how many places it has in it. When we used to have five hundred pieces of glass we needed 196 plates or 196 patrons, and we carry it around with our arm, we don't have to have a bushel basket to carry them in.

* * *

President Sullivan: Does any one desire to ask MacGillivray any questions?

Mr. Ridgeway: Mr. Sullivan, I would like to make this observation. I happened to be in San Antonio the first time they put this sediment tester on a truck. I was at the back door when some of the producers got their checks, and they were commenting on the sediment test. There was quite an argument among them. One fellow would get his sediment tester and take it around and show it to the other fellows, doing that you are able to build up quite a sentiment in favor of good milk. You cannot tell a man that his milk is dirty, but if you put it through your sediment tester and show it to him it will work wonderful results.

(To be continued in next issue)

ON THE ICE CREAM TRAIL IN TEXAS.

(Continued from page 100)

You cannot think of Ft. Worth unless you have Stubbs in mind. Lee chirped a clever one when he broadcast his solo entitled, "Say it with ice cream, bananas will be served later." From this you can gather that Lee is a good ice cream merchant at heart. You know birds can't sing unless they have the proper seed. Lee claims he got that way from eating ice cream.

* * *

What's the difference between cold cream and ice cream? That's just as easy as saying Shaw Bros.

Our friend Dunn says you put cold cream on your face, and Shaw Bros.' ice cream in your face.

That's a new one. It hasn't had time to melt.

* * *

We must tell Uncle Ab that we haven't left Texas yet. Who has ever left Texas without eating M-B Kream? "It's the taste that tells."

* * *

M-B covers Texas like the dew.

* * *

Uncle Ab says none of his dealers keep M-B Kream—they all sell it.

* * *

Robbie says his old side-kick and himself have been suffering with the writer's cramps. Of course, there's a cure for this, but who craves it? Johnnie Joys says, "If you can't dance, get on and ride." They both know the other half of it, which is the fun in pulling the pencil.

We are now doing our spring cleaning and are ready to pick up. Nuf Sed.

—"The Mississippi Valley Twine"

MYLES SALT MINES.

Salt is derived from many sources, but by far the most unique, is the naturally evaporated dome of pure salt, at Weeks Island, La., the property of the Myles Salt Company, Ltd., New Orleans, according to official records of that firm.

The mill and production plant are based on a pile of pure salt. This dome is actually one of the wonders of the earth, consisting of a solid mass of pure salt over a mile and a half in diameter and practically of unknown depth. Geologists claim that this phenomenon was formed in pre-historic times by intense salt evaporation and pressure simultaneously exerted.

TAG HOOKS

Save Dollars

Why use expensive, untidy, time-losing strings or wires while tagging your tubs or pails of ice cream?

SNAP 'EM ON

and use our rust-proof tag hooks.

SAVE TIME—Figure the cost of strings or wires. Then think of the value of a man's time while tying the tags on your tubs.

CAN'T RUST

Our new type of hooks are made of SPECIAL SPRING BRASS. They sell at \$1.95 per hundred, including staples. Besides a 10 per cent discount in lots of a thousand or more. Samples on request.

Dairy Development in Georgia

By JAMES J. HARVEY

THE creamery industry in Georgia continues to grow. Scarcely more than a year old, yet it has passed the age of swaddling clothes, and is rapidly rounding out into a robust youngster with vigor and stamina undreamed of 18 months ago.

An industry that only a few months back was born of necessity, now primes to be one of Georgia's most flourishing lines of business. From a total of 25,000 pounds of butter to 240,000 pounds a month, is no small achievement in 18 months. And, yet, that is the record of Georgia's development in her creamery industry in that short space of time.

JAMES J. HARVEY.

While we are apt to think of the product of any new industry as not measuring up to the standard of quality set by other communities in which the industry has become established, yet such is not the case with the creamery industry of Georgia.

Very recently the U. S. Department of Agriculture sent a man into the state to make a survey of the fast growing dairy industry. The government expert spent two weeks visiting the creameries (13 in all) in the state. A personal inspection was made of every creamery. The butter was carefully examined and scored as to quality. It was found that the average score of butter was 90 or above, the lowest score being 88 and the highest 92. When it is remembered that 90 score but is classed as Standard and 92 score as Extra, you can readily see the high position the Georgia creamery industry occupy. This fact reflects in the price the producer receives for his cream.

Georgia farmers should congratulate themselves for having close at hand a local creamery that is making high score butter, because it is only when high score butter is made, can the creamery afford to pay high prices for the raw product. Georgia housewives are recognizing the high quality of Georgia-made butter. They are demanding Georgia-made creamery products from dealers and as a result practically all the creameries in the state are behind with their orders. Keep the supply of butter ahead of the production and it will mean more cows for the state. More cows mean more prosperity and better health for the community. All these conditions combined mean health, wealth and happiness to the state.

* * *

New Installations.

The Savannah Co-operative Creamery is the first of the new plant opening up in our port of entry. As indicated by the title name, it is a producers' co-operative establishment, manufacturing ice cream and other dairy products.

The plant opened on July 2. The most modern machinery built has been purchased and installed. For handling of milk, glass-lined pasteurizers and strainers are used. In the butter department a thousand pound combined churn and worker is installed. Cream will be purchased all over southeastern Georgia and southern South Carolina for this department. The device and piece of equipment for the manufacture of high grade butter will be used.

There also will be produced a high grade lactated bulgarius buttermilk. For the manufacture of nutritious drink, a special glass-lined machine will be used, which will protect the quality of the product. This machine will be first one of its kind in this territory. Chatham county and Savannah are to be connected on the enterprise of her citizens in establishing such a modern creamery plant.

* * *

The Alachua County Creamery at Gainesville, Florida, is the last addition to Florida's rapidly growing dairy industry. The creamery will produce butter and maintain cold storage for meats and fruit. A new concrete building is being erected and operation will begin about October 1st. Cherry equipment will be used throughout.

* * *

The Americus Ice Cream & Creamery Company, Americus, Ga., is building a new plant. This company has recently re-incorporated and is extending its operations to cover the manufacture of Creamery Butter.

The new plant will be completed and ready for

Get the Facts of This Offer

We will ship a gallon of Cremilla to you—let you test it thoroughly in your cream—and, if you are not completely satisfied, cancel all charges upon receipt of the unused portion.

One-third ounce of Cremilla flavors perfectly ten gallons of cream. One and a quarter to one and a half pints flavors 500 gallons.

Cremilla is *better* than Vanilla. It is smoother, creamier, richer in flavor and more economical. Cremilla does not freeze out!

Ice Cream Overrun Scale

Eliminates Guesswork and Insures a Uniform Product

No. 4600

Graduated dial gives direct readings in percentage of overrun. Determinations speedily made and with great precision. No calculations necessary. No weights required. No cost to operate. No special skill required. Uses only about two oz. of frozen cream.

Designed at the suggestion of the U. S. Dept. of Agriculture. (Dairy Division) and supplied to U. S. Government and prominent ice cream plants for the rapid and accurate determination of overrun or inflation of ice cream.

Container on the left is filled with unfrozen mixture—container on the right with frozen ice cream; the dial pointer moved until scale balances. The percentage of overrun read directly from dial, reading from 0% to 140%.

The two 4 inch weight plates permit the scale to be used for the ordinary weighing of any commodity up to 2 lb. (1 kg.) when weights are used. Price, complete with 3 containers.....\$50.00

For sale by leading jobbers.

Sound Banking.

At a recent meeting of dairy interests in Georgia, the statement was made by a leading banker that the best service he has rendered his bank was the fostering of the dairy industry in his community. He stated that the only loans his bank was encouraging to make were those for the purchase of dairy cows.

It is a foregone conclusion that his bank must continue to flourish, because as the farmers increase their herds, their bank deposits must increase in proportion and it becomes an endless chain, spreading prosperity throughout the community.

LADIES' AUXILIARY TO S. A. I. C. M. AND OTHER ORGANIZATIONS

A Word from President "Sally"

My Dear Ladies:

Well, how are you all these real summer days? Hope you are all well and "warm." Won't you write and tell us, through the columns of The Review, what is new and exciting with you? We would all love to hear about it.

December is not far off, and I hope you are all going to be in Little Rock. We are planning on having the "bestest" kind of times. Any novel, entertaining suggestions that you have to offer will be gratefully received by "SALLY." We want to make our Little Rock meeting one that will be long remembered. We had such a delightful gathering in New Orleans. I hope you are all just as anxious for December to come as we are.

Now, my dear ladies, we are going to make this Little Rock auxiliary of our something worth while, and if each and every one of you will try to get some of your friends who are wives and daughters of the Southern Ice Cream Manufacturers and who are not members to join us, we will have "some gathering" in Little Rock.

I had the pleasure of lunching with our charming bride, Mrs. Florence Miller Evers, on Friday last. She is just as sweet as ever and will see you all in Little Rock.

If any of you ever come to this little town (the "Chicago," do not forget to look up "Sally Hudson." I shall be delighted to see you.

Hoping the "Dixie Flyerettes" column in The Review will be full of interesting tid-bits from all of you. I am, with best wishes,

Sincerely yours,

SALLY H. MAHONEY, President

You can get somebody to sell you anything you want if you use "The Ice Cream Review" Want Department. Hundreds of others to secure a good position.

You Need Never Worry

Atlantic super-clarified Gelatine passes the pure food requirements of all states in the Union. It is the highly-perfected process of making, together with the use of only the best raw materials, that has enabled us to supply our trade with gelatine of unexampled purity and clarity and high viscosity. Safeguarding our customers in this way has made our manufacturing costs slightly higher, but still our gelatine sells at less than ordinary gelatines of corresponding grades.

The test tube at the left contains Atlantic Super-Clarified Gelatine. Note its clarity — its high viscosity.

**"Purest and Best —
It Stands the Test"**

**Try It Out!
FREE!**

Make the test of trying out our gelatine by ordering a barrel from the nearest office. Use five or fifteen pounds and if it doesn't match up with our claims for it, send the unused portion back. We will pay the freight both ways.

It costs *less* and it does *more*.

Concerns who have standardized on Atlantic super-clarified Gelatine are assured of uniformly high quality, body and texture to their product.

On a Fast Train Through Arkansas

By ROBY and ANDY

Little Rock, A

Understand that Will Terry took a trip West. Wonder if he went to Shelby? We can tell him of places to witness fights.

S. S. Sommerfield chirped it was not necessary for him to look up the calendar for July 4. His customers shot in their orders so large and fast that his barometer reached the height of Pike's Peak, outstripping any previous season's attempts. You never get your feet wet in Arkansas, so why shouldn't good ice cream sell to an advantage?

Stuttgart, Ark.—Yes, we saw our friend Palm. Not Palm Olive. Mr. Palm is identified with the Meyer; and both are owners of the Grand Prairie Creamery Company.

Mr. Meyer reports a brisk business in his neck of the woods, and, with the aid of healthy crop conditions, their business certainly shall go over the top.

We believe Mr. Meyer, secretary of the Arkansas Ice Cream Manufacturers' Association, has the proper opinion on the situation, and such facts, coupled with sufficient optimism, shall award the industry a steady growth not only in the returns of substantial stock dividends; but in the service of a truly great food product of exceptional merit—both nutritious and delicious, since the present-day standards are held in high regard by all active association members. Co-operation spells strength in the Southern associations. Nuf sed.

Pine Bluff, Ark.—When you speak of Pine Bluff, you talk of Charlie Hooberry. Remember reading the notice on the wall, which is a welcome to all peddlers?

Charlie has won a cut glass door-knob for the honorary, well equipped plant he operates. Aside from running up shipping orders, he obtains a great pleasure in seeing that his plant is neat and orderly.

Friend Hooberry was a little under the weather but has acquired his boyish form again. No, he was not suffering with "writer's cramps."

Overheard in an Arkansas Barn-Yard.

"That's the Guy I am laying for," muttered the hen as the farmer crossed the yard.

Broke Again.

The cake-eater escorted his best girl into their ice cream parlor, and both ordered an ice cream soda.

The drinks were served. It seemed the fair maiden had some trouble with her straw and, after some deliberation, beckoned to the waiter and said: "My sucker broke."

The waiter promptly responded: "Oh! that's all right, kid, you look good to me, I will take care of the check myself."

Birds cannot sing without the proper seed. And you have cleared your throat and toned up your vocal chords try this one:

THE "Ella Brand" Ice Cream Compound Flavors are the most distinctive of all Ice Cream flavors—distinctively different—they have "life"—they are healthful and delicious—they conform to all Federal and State Pure Food Laws.

More Orangella, Lemonella or Limella can be sold with less pushing than any other fresh fruit flavors, due to the intelligent, powerful and attractive advertising of Orangella, Lemonella and Limella. These flavors are known and well established—the demand is already made; there is no missionary work to do. The splendid reputation of these three fresh fruit flavors, built up by our advertising, is an advantage that can hardly be overestimated.

Orangella, Lemonella and Limella are used in ice creams, ices, frozen custards, milk or water sherbets, parfaits, frappes, punches, brick combinations, etc. Formulas tested and tried by some of the best known and biggest manufacturers in the country are at your disposal.

DIXIE MAIL BAG

ARKANSAS MANUFACTURERS BUSY.

July 11th, 1923

Every Arkansas ice cream manufacturer just now very tired, but happy. Some report an increase in business for the "Fourth" of 150 per cent—others not so much, but all are satisfied with the way business is going.

The Arkansas boys are making preparation to entertain the Southern association in Little Rock December 4, 5 and 6. All of those that wish to attend should make their hotel reservations as soon as possible.

A meeting of the directors of the Arkansas association will be called in the near future to prepare to make arrangements for this purpose.

For the present every manufacturer is very busy. We are having real ice cream weather and everybody is making up for the late season we had in this part of the country.

Business conditions are greatly improved over a year and from the looks of the volume of ice cream business is moving at present, this will be a good year for the industry.

The "Mississippi Twins" made a very pleasant trip on some of the manufacturers this week and, as usual, brought cheer and a good time with them. Andy has a new trick that he is trying on everybody, also a lot of stories that are very good. Come again, boys; the last string hangs on the outside.

WHAT THE DIXIE FLYERS MEAN TO THE SOUTHERN ICE CREAM INDUSTRY

By THOS. J. STEWART*

WHAT do the Dixie Flyers mean to the Southern ice cream manufacturers? This question has often been asked but left without a definite answer. As a general thing the Southern ice cream manufacturer considers the Dixie Flyer his friend, but to broaden this where it will do the most good it will be necessary to have more co-operation on the part of both the ice cream manufacturer and the Dixie Flyer.

THOMAS J. STEWART.

When they broaden out and look at the matter from a general instead of an individual point of view co-operation will bring real results.

The Dixie Flyers cover Dixie from one corner to the other, and try to accomplish the same idea in the South that the Salesman's Club of the National Ice Cream Supply Association are doing in a national way, namely, to "help build the ice cream industry."

The Dixie Flyers recognize that the ice cream business is just an average American

business, with a fair profit, and that it is not a get-rich-over-night affair. They know that the ice cream business has become so big that it is really an American industry and that the American public are interested to know the truth about it, and if the truth about the ice cream business was really broadcast, some of these wild tales that one hears from the layman whose only knowledge about ice cream is that it is cold, sweet and good to eat would disappear.

There is too much good, from a food standpoint, in ice cream and just as soon as the public appreciates the food value of ice cream, the ease with which it is digested and its value to the sick and children, ice cream will become a year round business and not simply that of six months.

The Dixie Flyers can do much good to the ice cream manufacturers by seeing that the truth regarding ice cream is told, and in his every day work he is in a position to give such information as is beneficial from one plant to another, he can give the new ideas of progress and methods. He also helps to stabilize prices and he also upon occasion can give good advice to the ice cream manufacturer who is a bit weak in the knees, and to the chap who really don't know the actual cost of his product.

Actually more harm is done to the industry by the

* Written especially for The Ice Cream Review by Mr. Stewart, who has for several years been identified with the development of the Southern ice cream industry.

chap who undersells his product than the man who overcharges. The man who overcharges will be put right by competition, but the chap who undersells is headed for bankruptcy, and when that occurs it is Dixie Flyers who generally comes out the small end of the horn.

It may be that the Dixie Flyers' idea is in the line of selfishness. This is granted but this selfishness is with the idea of helping the other fellow build his business, make a better customer for the Dixie Flyer and real money for himself. There are so many advantages that cannot be described by close co-operation of the ice cream manufacturer and the Dixie Flyer that it would take pages to tell and the above suggestions are just a few that come to the mind.

SUPPLY ASSOCIATION'S CODE STUDIED.

The Association of Ice Cream Supply Men has again been the object of special recognition by the Chamber of Commerce of the United States.

The latter organization some months ago appointed a special committee to study business codes. It has now issued a preliminary report in which are embodied fourteen of the 42 paragraphs of the fair practices code of The Association of Ice Cream Supply Men, now a part of the daily life of the country's ice cream industry.

The final report of the special committee of the chamber will be issued to members of the chamber which includes leading persons and organizations in American business.

DIXIE BUSINESS GOOD, SAYS HOLLINGER.

A pleasing report of business conditions throughout the South was made by Chris. Hollinger, Hudson Manufacturing Company, representative, who visited the editorial office of The Ice Cream Review last month. Hollinger was fresh from a trip through Georgia, Kansas, Tennessee, Oklahoma, and Texas.

"Found business strong everywhere," he said, "with a few of the Southerners looking forward to the Southern. Things also look good in Kansas, Missouri, Minnesota, and other states I've visited lately."

JORDAN'S SPEECH QUOTED.

M. G. Downing, assistant secretary of the Mississippi Ice Cream Manufacturers Association, has asked The Ice Cream Review to announce that the paragraphs under the subhead "Romance of Ice Cream," in his speech at the 1922 Mississippi convention, were erroneously credited to President Charles G. Morris, of the National Association of Ice Cream Manufacturers' Association. The quotation really was from a speech by Oliver S. Jordan, president of The Association of Ice Cream Supplymen, broadcast from a Cleveland radio station at the time of the 1922 National Exposition.

A Message to
The American Ice Cream Manufacturers
from
The Edible Gelatin Manufacturers of America, Inc.

An Association composed of the following manufacturers of Edible Gelatin:—

CRYSTAL GELATINE CO., Boston, Mass.

ESSEX GELATINE CO., Boston, Mass.

KIND & KNOX GELATIN CO., Camden, N. J.

MILLIGAN & HIGGINS GELATINE CO., New York, N. Y.

SWIFT & COMPANY, Chicago, Ill.

UNITED CHEMICAL AND ORGANIC PRODUCTS CO., Chicago, Ill.

***UNITED STATES GELATINE CO., Milwaukee, Wis.**

J. O. WHITTEN CO., Winchester, Mass.

*NOTE:—Through error, the United States Gelatine Company's name was omitted in the July advertisement of this association. We would now emphasize the fact that they were one of the original members and donors of the Fellowship, and a most loyal supporter.

¶ These manufacturers have followed the advance of the ice cream industry since its infancy, particularly the work of the scientists that has been compiled.

¶ By supplying edible gelatine of indisputable quality (pure, uniform strength) our members have materially aided in the maintenance of standards which makes the product of American ice cream manufacturers paramount.

¶ In addition to particular attention to individual requirements, prompt shipments, active co-operation, the Edible Gelatin Manufacturers of America, Inc. offer technical service through the Industrial Fellowship which is maintained at the Mellon Institute of Industrial Research, University of Pittsburgh, Pittsburgh, Pa. Problems of direct in-

terest to the ice cream industry are being investigated there by unbiased scientists, whose reports will be made available to ice cream manufacturers.

¶ The Edible Gelatin Manufacturers of America, Inc. will greatly appreciate your visiting its booth at the National Convention and Supply Men's Exhibition in Cleveland, Ohio, October 22nd to 27th, where unbiased information regarding edible gelatine, its properties, and use, can be had.

¶ Research has shown that edible gelatine has a very decided food value. It greatly increases the dietetic importance of ice cream, in addition to its well-recognized, and essential stabilizing qualities. Experimental results obtained will be fully demonstrated at Cleveland.

BOW, WOW! SEE WHO'S HERE.

Union Springs, Ala., July 9, 1923

Just finished a two weeks' trip down in Florida. The ice cream men down there are all enjoying good business, and all are optimistic regarding the coming "tourist season."

ROY S. JENNINGS.

A great many of the Southern manufacturers have told me they are going to Cleveland. Believe this convention is going to be the best yet.

All the manufacturers I have met report a big Fourth of July business. It has rained here in Dixie nearly all summer and if we can just have some hot weather, without the moisture, we can all expect big business.

* * *

The other day while in Albany I heard a good one on the boll weevil. One of these Georgia crackers said he was awakened a few nights ago by a tremendous commotion in his cotton patch along side his house. He dressed and went out to see what the trouble was all about. Said he found an old boll weevil just beating the life out of a young one because he wouldn't take two rows at once.

Yours very truly,

ROY S. JENNINGS.

You can find the person who will be glad to buy what you wish to sell, by letting your desires be known through an advertisement in The Ice Cream Review.

"Talk About Romance You Have Romance in Your Hands"

By R. Lee Sharpe

The Ice Cream Review—in the best sense of the word—has just as important a place in the modern ice cream industry as modern equipment. Equipment may be well and good, but without the latest information on the best use of that equipment how can one expect to obtain results which will enable him to survive the exacting demands of present-day competition?

WE LIVE IN A WONDER AGE. The touch of a button, and the evening is another day. Marvelous, but commonplace, for when one tiny globe bursts into light at your touch, literally millions repeat the performance the world 'round, the same globe, the same button, the hand pressing is the only difference.

There's the telephone, motion picture, aeroplane, and other wonderful inventions that tell us of the advancement of man to a point where the romance of Arabian Nights sinks into insignificance. In your hands you are now holding and reading one of the romances of modern times—your trade paper.

In a practical way, The Ice Cream Review is your Aladdin's Lamp. It will help you in the realization of your many worth while wishes—and you will find it ever ready to do great things for you, if you will only let it. Through its magic pages you can find your "dreams come true"—successful men tell of their visions that led them on to greater heights. Herein you will find the ideas and plans that will prove stepping stones to your ideal. All are yours, if you only wish and work for them.

What an age we live in. To us, heirs of all the artistry of the past, come the products of the world, the magic inventive genius, all at our command. At a stroke of our pen or pencil on our letterhead, they step right out

of the advertising pages, with their catalogues and salesmen to tell us of their merits, and we do not have to move out of our office chair.

There is nothing more wonderful than modern American commerce. Nothing more alluring than to be master of the enormous flow of ideas that run through the trade paper, the trade catalogue and the trade correspondence.

No fiction, no book of fiction, no book of romance ever was the equal to it. If men fail as they do, in the successful conduct of their business, if their business goes down, it is because they have failed to look at it in a broader in a larger sense.

The Ice Cream Review is more than paper and ink, just as man is more than flesh and blood. Its mission is to give the news of "your world," its throbbing messages for your advancement—and the big and little things that help you to go on and on to even greater things.

In its columns you will learn the hundreds of things you WANT TO KNOW, and MUST KNOW to go hand in hand with progress, to keep step with modern business, in these modern days.

Give The Ice Cream Review welcome. Read it, and interpret its monthly messages. Find the romance between its pages—the magic in its columns, for it has much to give—and it is yours.

The Olsen Publishing Company's Outing

good winners, which is the most important part of the sportsmen's creed.

A chartered car on the interurban, along with a fleet of automobiles made the journey a short one, and ideal picnic weather insured the day's success.

The sports committee arranged a long list of events suitable for all stages of physical prowess. A ball game for the men between the "H. P.'s" and the "E. K.'s" was easily the big event of the sports program. It ended in a riot—of protests from the losing side, the members of which still insist that the umpire was bribed to throw the game to the "H. P.'s" with a score of 20 to 19. At any rate it was close enough to be crooked.

Everybody felt satisfied and was happy over whatever happened. Never were winners in such abundance. It was this spirit which made the day one grand success—which made everybody feel particularly light of heart when the quartet from the night press crew wound up festivities just before nightfall by singing "The End of a Perfect Day."

It was a tired but thoroughly happy band that went on its way rejoicing back to the city to take, up, the following Monday, where it had left off in its day-and-night service to the dairy industry. Everybody did not have a prize, but nobody was depressed. For all had won—everybody from the printer's devil, with his unfamiliar clean face, on down!

There can't be any losers at "The End of a Perfect Day." Just can't be.

"All also-o-and-d for Mequon!"

Now, Mequon doesn't appear on anybody's timetables and on mighty few maps. But if you could have been with us June 30, you would have wondered why folks ever pay good money to go to California, Atlantic City, King Tuts tomb, Sing Sing, or any such resorts.

The Fourth had its fireworks, Christmas its toys, Memorial Day its flowers, and St. Patrick's day its "eats," but our June 30 had all of these things rolled into one day. Only, the fireworks of our picnic consisted of dynamic energy and unchecked spirit.

Nature provided the flowers, the "eats" came from the best restaurant in the world, the Great American Home, and Nature's Wonderland was the temple of our festival. We had our own band.

Some demon statistician might be able to tell how many trips around the world we ran in our games, how many walls around China could be built with all the ice cream cones eaten, and how many tons of energy was expended, but everybody in this band was a performer, and all statistical facts are lost to posterity.

In fact, everybody was too busy having a good time to worry about such things as figures and rent day. The sentiments of the picnicers were eloquently expressed by the office-boy, who said: "Gee, I ain't had so much fun since the school-house burnt."

But one thing about that picnic and its contests and races, there was no one to shake hands with the losers. This was for the simple reason that no-

avored land, but it has gone down as a red-letter day for The Olsen Publishing Company and its large family, not even being eclipsed by the fiery Fourth, the impressive 30th of May, or any other occasion of pomp and splendor.

For June 30th was the day of our picnic. It was fun-and-frolic day for the men and women who spend six days in the week producing the world's leading dairy publications and dairy advertising literature.

Officially, it was get-acquainted day for the members of our day-and-night forces, members of the editorial, advertising, circulation, service and art departments, printers, pressmen, engravers, office employees—everybody.

With all other cares and troubles of the world, titles and ranks fell thicker than crowns in Europe as department heads joined with the rank and file in quest of fun. First names, and lots of them, were the order of the day.

Friends who have seen our family at work, know how seriously it takes this business of serving the dairy industry. It is composed of red-blooded, fighting men and women who work and play and love with their whole hearts. The program called for play on June 30 and play they did. The gamiest bunch of sports that ever talked back to a boss packed up their troubles in their old kit-bags and went forth to show that they could win and lose with a smile the same as they could work over-time for the good of the cause—and like it.

At 8:30 Saturday morning we stopped the clock

WASHINGTON

News From Far and Near

CALIFORNIA

Los Angeles, Cal.—A new ice cream company has been organized under the firm name of Wholesale Ice Cream Company, with a capital stock of \$100,000.

Los Angeles, Cal.—The L. J. Christopher Company has in operation a distributing plant, placing approximately 500 gallons of ice cream a day throughout this territory. It was installed at a cost of about \$20,000, officials announced.

Tracy, Cal.—The new \$35,000 creamery and ice plant at Tracy, Cal., was opened a short time ago. The building was constructed of steel and cement tile, and the patent process cement brick. This creamery will include the dairy products in its output.

Probably the greatest interest attaches to a new invention which will be put into use for the first time in this country. It is the invention of R. Stolberg, formerly of Valley Creamery of Stockton, who is now interested in Tracy Creamery. Mr. Stolberg has had wide experience in creamery management and reports have it that the new invention bids fair to revolutionize the industry. The invention is an electrical pasteurizing or purifying machine which does away with the heating and then the cooling of the milk, thus saving valuable time, and costly machinery. They say it is economical in construction and simple to operate.

The plant is equipped with modern machinery throughout, and nothing has been spared to make it a model creamery in every way. An ice plant is an adjunct, the capacity being fifteen tons daily. A 200-gallon homogenizer is included in ice cream mix manufacture.

Dover, Del.—Shanahan & Elliott Ice Cream Co. has filed articles of incorporation for \$100,000. The new company will manufacture ice cream.

Wilmington, Del.—Articles of incorporation were recently filed by the Purity Ice Cream Company. Capital \$100,000.

Paris, Ill.—The Boyer Ice Cream Company's new \$40,000 plant opened for business recently. Mr. Boyer has a modern plant at Charleston, which burned down some time ago.

Colfax, Ia.—The Porter Farming Co. has purchased the necessary machinery and will begin the manufacture of ice cream made ice cream soon.

West Union, Ia.—E. C. Johnston recently began manufacturing ice cream in his new plant at West Union, Ia. Johnston's West Union Ice Cream factory has a capacity of 500 gallons of ice cream every fifteen minutes. The daily output will be about 500 gallons, the present run being 300 gallons.

Seventeen towns in northeastern Iowa will be supplied with Johnston's ice cream by trucks. West Union and Hawkeye creameries supply most of the sweet cream.

The factory is operated by an X L ammonia refrigeration plant installed by H. A. Born & Co., of Chicago, and only use the new factory has for ice is to pack the ice cream for shipment. In a very large compartment protected by the most complete cork insulation is located the brine room which is kept at from zero to 5 degrees below. The freezing room has a capacity of 1,200 gallons of ice cream. That large quantities of the product can be made up in advance of special requirements and kept in storage.

Wichita, Kan.—The Vernon Ice Cream Company has made \$10,000 worth of improvements at their ice cream factory on Marshall St.

Wichita, Kan.—B. F. Copley, president and owner of the Wichita Creamery Company, has purchased the entire output of the Zipp Butter and Ice Cream Company, 114 Pattis St. The Zipp Butter and Ice Cream Company has capital of \$20,000 paid in.

Jennings, La.—The Farrell Ice Cream factory has opened a branch house in Jennings. Headquarters of the company are located at Crowley, La.

Hagerstown, Md.—The Sine Creamery Company, capitalized at \$150,000, has filed notice of dissolution, and is being sold out to the Imperial Ice Cream Company.

Portland, Me.—Simmons & Hammond Manufacturing Co. has purchased a factory building comprising a little over 40,000 square feet of floor space at 323-329 Commercial Street, Portland, Maine. A modern ice cream plant has been completed in the basement and the two lower floors, which, according to those who have visited the plant, is the best ice cream factory in New England.

According to officials, the new equipment is of the approved construction; the new lay-out has multiplied the capacity about three-fold. In the present hardening

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

degrees below zero) 20,000 gallons of ice cream can be made at one time.

There has been taken in the designing of the plant to large rooms and equipment so as to bring the cans to the temperature absolutely clean and cooled to near the temperature of the ice cream going into them. This chilling room, according to reports, the only one of its kind east of New

gravity conveyors, bucket elevators and specially designed trucks play an important part in bringing up the efficiency of the plant and assuring a quality product. With modern conveniences the same force can readily handle as much cream in a day as it was able to in 1922.

It is expected that the entire plant will be completed September 1. The plant as it stands today, represents building and equipment about \$200,000, according to N. J. Mayo.

Plainview, Minn.—The Plainview Co-operative Creamery Association was recently formed to produce ice cream and dairy products. George H. Christison is one of the organizers. The company is capitalized for \$50,000.

Lythedale, Mo.—Work has begun at the creamery to add an addition to the building for an ice cream factory.

Jackson, Miss.—The Magnolia Ice Cream Co., Walter M. Whit, manager, will install additional equipment.

Glen Falls, N. Y.—The Glen Falls Ice Cream Co. has leased another lot in Maple St., adjoining the one at Prospect Sts. The company will begin the erection of a plant soon, contract for which has been awarded to Fred Acker.

Minot, N. D.—Plans for the building of a new \$40,000 ice cream factory and creamery have been announced by E. White, Sr., who is associated with S. J. LaDue in the ownership of the White Ice Cream Co., of this city. The building will be 40x50 feet in size, and two stories high, with a basement.

Cincinnati, Ohio.—At a stockholders' meeting of the Velvet Ice Cream Co., a corporation organized under the laws of the state of Ohio and authorized to do business in the state of West Virginia, held at Wheeling, on June 18, the following resolution was adopted: "That the Velvet Ice Cream Company withdraw from the state of West Virginia." Telling is president of said corporation.

Columbus, O.—The Crane Ice Cream Co. is erecting a new plant over its power plant, but has taken no move to put the new building on its Long St. side as once was reported.

Mechanicsburg, Pa.—Many improvements are being made at the Rakestraw Ice Cream plant.

Okasie, Pa.—Walter K. Terry purchased the defunct Central Ice Cream Co., at a sheriff's sale recently.

Galveston, Tex.—Galveston Ice Cream Co., L. M. Kelsey, has bought the site at Fifth St and First Ave., and erect plant with capacity of 500 gallons of milk daily. The structure will be one and a half stories, brick, and will cost approximately \$17,500.00.

Bellevue, Wash.—Increased business that has come to the Thompson & Parrish Ice Cream Company has necessitated some important additions of machinery, which will increase the capacity of the plant 50 per cent. It is claimed that for this year the business of the company has doubled in one month over the business of the same months in the previous year.

The Thompson & Parrish plant is the most complete ice cream plant in western Washington, south of Seattle, according to reports. The company enjoys the reputation of producing quality ice cream and its product is sold in many surrounding towns.

Bellevue, Wash.—J. W. Carlton is proprietor of the new Belvue Ice Cream Co. on fifth St., where operations were commenced recently. The plant has a capacity of 500 gallons of ice cream daily. A refrigerating plant has also been installed and ice machine. The hardening room has a capacity to store 500 gallons of ice cream.

Richland Center, Wis.—The Richland Dairy has been sold to the Carter Ice Cream Co. by Theron Elliot.

Sparta, Wis.—Sparta Ice Cream and Bottling Company recently incorporated for \$15,000. Incorporators are W. Hoffman, Fred Hausmann and Victor H. Caspers.

Don't You Forget!—The 23rd annual meeting of the National Association of Ice Cream Manufacturers will be held in connection with the second national exposition of The Association of Ice Cream Supply Men at Cleveland, October 22-27 inclusive.

PROSPERITY FOLLOWS THE DAIRY COW. Be sure you attend the National Dairy Exposition—Syracuse, N. Y., Oct. 5-13.

Refrigeration Facts

To any ice cream manufacturer we will gladly send this booklet. It contains some useful information that you will want to keep, besides showing how the Baker Ice Machine is especially adapted to meet every refrigerating problem of the ice cream manufacturer.

The Baker is a slow speed type, which is a positive guarantee of economical operation. Any man knows that if he races a horse at top speed all the time the horse soon wears out—so it is with an ice machine. Some of the first machines built 17 years ago are still in daily service.

Baker Plants are Cheaper Now Than Before the War

Any manufacturer who does not use mechanical refrigeration absolutely loses money every day in cost of operation.

With the new low prices of the Baker Plants there is no need for any company suffering such loss, especially when a Baker will cut manufacturing costs from 50% to 75% over ice and salt.

We will gladly estimate
the cost of installing a
Baker in your plant
without obligation to
you.

Trade Notes

"Three days after the date an order was received, the John J. Grothe Co., Woburn, Mass., promises to ship "Zero" refrigerator bodies to take care of that new route or unexpected jam." The foregoing is the substance of a little piece of advertising literature now being sent out by the Grothe Company which bears all the earmarks of a promise to pay and the Grothe main plant and branches have got to make it good. Mr. Mackay, the general manager, said so himself.

* * *

There is a man, well known in ice cream machinery circles, who has acquired the distinction this past year of

N. M. THOMAS.

writing the two largest orders for equipment placed during the season. At least this is his claim, and there is another who has surpassed his achievements, let him challenge N. M. Thomas of the Cherry-Bassett-Winner Co.

His two record-breaking orders consist of an order from the Hoefler Ice Cream Company of Buffalo for six viscolizers and 43 Pfaudler glass lined tanks, and an order just recently taken to outfit the new Breyer Ice Cream Co. plant at Philadelphia.

This second order consists of two viscolizers, twelve Cherry coil vats, twenty-one Cherry freezers, fifteen Thomas batch measures, two direct expansion Bestov coolers, and two R. & A. can washers.

* * *

Ice cream display material in 150 designs is supplied by Wolf & Lavenson, advertising display specialists, with plants in Philadelphia and Camden, N. J. The company produces high-grade posters, hangers, cut-outs, lithographed window trimming displays, and what special material of this nature manufacturers may wish to get to tell their story in the retailers' windows and over their fountains. A specialty is made of individual trade-mark work. Frank Jones represents the company in the states of Indiana, Illinois and Wisconsin, and there are representatives in all other states. Ice cream manufacturers in all sections of the country have used this advertising material.

* * *

Impruv-Mix is a semi-paste produce of 75 per cent solids, of egg-yolk color, quickly soluble in warm water or milk or may be applied to the hot mix or the gelatine solution according to the Impruv-Mix Co., New York City. Its color imparts a cream lustre, removing the gray tint found in most pasteurized mixes, it is claimed. Impruv-Mix dispels all butter flavor in a sweet butter, condensed milk and milk powder mixes, and produces therein a tempting cream flavor, free of the unpleasant aftertaste caused by insoluble substances, officials of the company say. Impruv-Mix is used in quantities of 4 ounces for usual freezer batch of 5½ gallons, or 1 ounce for every 13 pounds of finished mix, when added at the pasteurizer.

* * *

C. H. Roessner has been appointed district sales manager for The Foxboro Co., Inc., manufacturers of high grade recording and indicating instruments, Foxboro, Mass. He will have his central offices at 1510 Monadnock Bldg., Chicago, Ill.

A. F. Mundy, formerly of the Chicago office, will represent the company in southern California, with offices in the Pacific Finance Bldg., Los Angeles, California.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

One of the most interesting developments in the ice cream industry is the appearance of the national advertising campaign of Heathized ice cream in scores of the leading magazines and periodicals in the United States.

This is a long jump from the humble booth at the National Dairy Show in the fall of 1919, less than four years ago, when the story of Heathized ice cream was first told by interested ice cream manufacturers by the inventor.

At that time only one ice cream manufacturer in the country was employing the Heath method. Today, according to P. Heath, of the ten largest ice cream manufacturers in America, fifty per cent are employing this new method. The development of the Heath idea has been so rapid that Heathized foods—ice cream, butter and bread—may be purchased in thousands of cities in the United States, Canada and foreign countries.

The national advertising campaign put out by the National Ice Cream Products Company of Chicago is of a generally cooperative nature. The public is urged to eat more ice cream. The story of the food value of ice cream is intelligently told.

* * *

The U. S. Freezer & Machine Corporation's 120 quart freezer has been a big seller, according to officials. They give herewith a list of all those recently sold, "to give an idea of how popular they have become." Keeley Ice Cream Co., Salt Lake City, Utah, One 120 quart; Caum Ice Cream Co., Altoona, Pa., one 120 quart; Turner Center Store, Boston, Mass., one 120 quart; Frost Kist Ice Cream Co., Passaic, N. J., three 120 quarts; Westchester Ice Cream Co., Yonkers, N. Y., three 120 quart; Superior Ice Cream Co., 734 E. 134th St., New York City, three 120 quart; Bros. Ice Cream Co., E. 125th St., New York City, four 120 quart; American Ice Cream Co., 8 Cannon St., New York City, three 120 quart; Ideal Ice Cream Company, 256 N. 10th St., Brooklyn, N. Y., two 120 quart; Supreme Ice Cream Co., 66 Rochester Ave., Brooklyn, N. Y., three 120 quart; L. J. Purity Ice Cream Co., 1046 Myrtle Ave., Brooklyn, N. Y., four 120 quart; Chapin-Sacks Corp., Washington, D. C., five 120 quart; Evansville Pure Milk Co., Evansville, Ind., two 120 quart.

The Rice & Adams Corporation has moved into new quarters, now being located at 217 East Illinois St., Chicago, Ill. The company formerly was located at 104 South Michigan Ave.

* * *

The Creamery Package Mfg. Company, 61-67 W. Madison St., Chicago, has just published a bulletin describing the Progress ice cream mixer. It is made in regular heavy duty types and in sizes ranging from 30 to 100 gallons capacity.

The drive mechanism for the revolving agitator is of a new gear and can be furnished for operation by belt from a shaft or suspended motor or by motor mounted on machine.

The agitator may be removed entirely and the drive mechanism may be swung to one side, out of the way. Dress the above manufacturers for free copy of the bulletin.

* * *

The new Lamson dairy conveyor is described by the manufacturers, The Lamson Co., Syracuse, as being so constructed as to do away with all the annoyance and expense of breakdowns commonly caused by the bearing being worn away by the lactic acid in milk, the hot water used in washing, etc. The "new improved and acid resisting bearing" in the Lamson conveyor is claimed by officials to be one of the simplest ever devised, "yet embodying advantages not to be found in bearings many times as costly. The roll is built on a cold rolled through shaft, and is signed for maximum liveliness and strength, officials say. The pressed steel roll heads are welded to the roll and are a force fit on the shaft, making roll, heads and shaft one hermetically sealed unit. The shaft revolves in solid acid resisting anti-friction alloy bearings which are held by means of split rings in accurately punched holes in the side angles of the conveyor. The diameter of the holes is slightly larger than that of the bearing, so that the rollers are self aligning. The side thrust of the rollers is kept up by the pressure of the ends of the spindles against the inside of the bearings.

* * *

Officials of the Orange-Crush Company, Chicago, have announced arrangements whereby orders for orange-crush, lemon-crush, lime-crush, Ward's cherry, and Ward's ice cream compound will be handled in such a way "as to give very much better service and a better price." MICHIGAN ALLIED DAIRY ASSOCIATION

Butterfat Content of Ice Cream.

Experiments conducted by representatives of Federal Department of Agriculture may be worth attention. Just the "high spots" are here recorded.

82% of purchasers favored 18% fat in ice cream
10.4% of purchasers favored 15% fat in ice cream
7.6% of purchasers favored 12% fat in ice cream
60% of purchasers favored 19% sugar in ice cream
30% of purchasers favored 16% sugar in ice cream
10% of purchasers favored 13% sugar in ice cream

Ice cream made from milk containing 10 per cent and with varying proportions of milk solids not fat

55.6 per cent of purchasers preferred ice cream with 12 per cent of these solids.

25 per cent of purchasers preferred ice cream with 9 per cent of these solids.

18.6 per cent of purchasers preferred ice cream with 6 per cent of these solids.

In a 14 per cent ice cream 63 per cent of purchasers preferred 1 per cent gelatine; 25 per cent of purchasers preferred no gelatine; 14 per cent of purchasers preferred 5 per cent of gelatine.

Fat content did not seem to have any great effect on quantity a person would eat, except when ice cream was very rich. But little difference in amounts eaten in 10 per cent and 13 per cent fat.

Exhibits of the latest and
best products of all the lead-
ing makers of equipment and
supplies will be in themselves
a liberal education for every
man engaged in any branch
of the milk using industries.

COME! Bring your older
boys and girls. Bring
your superintendent and other
technical heads. Invite your
larger producers to join your
party—they'll learn how to
produce better milk and more
of it, and how to get it into
your hands in better condi-
tion.

And while there, make our
exhibit in Machinery Hall
your headquarters.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

4000 Persons will Register at the Cleveland Exposition

Why?.....Because it is the annual demonstration meeting, market, Idea Exchange of the whole industry.....It is the practical university of ice cream.

Entertainment—of the proper sort—throughout the week.

Everything in machinery, equipment, service, supplies.

Everyone in the supply field who is contributing to the production and selling efficiency of the industry.

In conjunction with ice cream's greatest National Convention.

Fare and one-half round trip rates to the 23rd annual convention, National Association of Ice Cream Manufacturers.

Be One of the 4000!

BULLETIN OF EVENTS

World's Dairy Congress—Washington, D. C., Oct. 2-3; Philadelphia, Oct. 4; Syracuse, Oct. 5-10, 1923. H. E. Van Norman, President, 426 Star Bldg., Washington, D. C.

National Dairy Exposition—New York State Fair Grounds, Syracuse, N. Y., Oct. 5-13, 1923. W. E. Skinner, 910 So. Michigan Ave., Chicago, Secretary.

National Association of Ice Cream Manufacturers—Annual convention, Cleveland, Ohio, week of October 22, 1923. Secretary, N. Loewenstein, 155 N. Clark St., Chicago, Ill.

Association of Ice Cream Supply Men—Second Annual Exhibition, Public Hall, Cleveland, Ohio, October 22-27, 1923 (inclusive). Roberts Everett, Secretary, 1328 Broadway, New York.

Association of Ice Cream Manufacturers of Pennsylvania—Annual Convention, Nov. 13 to 15, 1923, Alto Hotel, Altoona, Pa.

Oklahoma Association of Ice Cream Manufacturers—Annual Convention, Tulsa, November 21, 22 and 23. Secretary, J. B. Porter, Tulsa.

Texas Ice Cream Manufacturers' Association—Annual Convention, Galveston, November 26, 27 and 28. Secretary, A. J. White, Mistletoe Creameries, San Antonio.

Southern Association of Ice Cream Manufacturers—Eleventh Annual Convention, Little Rock, Ark., December 4, 5 and 6. Convention Headquarters, Marion Hotel. Secretary, J. W. Clopton, Decatur, Ala.

Pacific Ice Cream Manufacturers' Association—Annual Convention, Vancouver, B. C., Dec. 3, 4 and 5. Secretary, Bert Walker, Tacoma, Wash.

North Carolina Ice Cream Manufacturers' Association—Annual Convention, Winston-Salem, January 15 and 16, 1924. Convention headquarters, Robert E. Lee Hotel. Secretary, Arthur E. Dixon, Fayetteville, N. C.

Western Canada Ice Cream Manufacturers' Association—Annual convention, Moose Jaw, Sask., February 6, 7 and 8, 1924.

THIS is the time of the year when your association secretary may be found walking around in the office stopping occasionally to bite himself in the arm or the office cat out of the way. For this is the time of the year to draw up programs, and the poor, pleading secretary certainly has his troubles in gobs.

If everybody asked to make a speech at a convention had his way about it, there would not be any speech for it seems that nobody in the world likes to make a speech. But since a convention must have speech, somebody has to be sacrificed. It certainly is a fine thing to show your loyalty to your association to agree to let members about some experience you have had that might be helpful to others.

If you are called upon to take part in your association program, by all means accept. If you do not feel qualified to discuss the subject assigned to you, say so and tell the secretary what you really would like to discuss.

Every man has some kind of an idea he can discuss and false modesty should not be allowed to starve the way.

THE effort toward something new and novel in ice cream is being carried on very aggressively at this time. It is not to be discouraged. Many are absolutely right in the belief that the greatest effort should be directed toward making plain ice cream more saleable. Plain ice cream is the rock bottom foundation on which the industry securely rests when many new fads and frills have had their day and past; but anything doing a greater outlet for ice cream is worth considering.

We believe in conservatism to a certain extent, but when it is practiced to the sacrificing of progressive ideas, conservatism is misapplied.

Several years ago a novelty came to the ice cream industry in the form of the ice cream cone. It proved a real boon to the industry. Then followed the ice cream sundae dishes, ice cream sodas, fruit combination dishes, etc. All helped to sell more ice cream. The idea of packaging ice cream to take home did much to increase home consumption. The chocolate-coated ice cream have moved lots of ice cream since their advent.

One of The Ice Cream Review's interesting features is the one dealing with trade mark ice cream novelties. It is worth while to keep up to date what is going on in this direction. Some day we will find somebody with an idea that it will mean much to the industry. Ideas are the things that count. Many of you have some. Try your hand at it.

EVERY year finds more ice cream manufacturers interested in the National Dairy Exposition. There are good reasons why all should be. The dairy industry is the foundation of our own. A good business man believes in building up his business along thorough lines and wants to work from the foundation up.

Every ice cream manufacturer should interest himself in the work of dairy officials. The ice cream trade

called the "Rose of the Dairy Industry," is vitally interested in any effort toward building up popularity for dairy products. The growth of the dairy industry is dependent upon the co-operation of its various branches, and all of those branches have important relations to the advancement of the ice cream industry.

At this time there is plentiful evidence that dairy officials are moving with well-defined plans for an event of great profitableness to the dairy industry and all its branches. The ice cream manufacturer, even aside from the special program prepared for this branch, should find much to benefit him by taking in the National Dairy Exposition in Syracuse, N. Y., October 5-13.

SELLING your troubles to a policeman is not as satisfying as telling them to some other people you know, and not even telling them at all requires a real effort sometimes.

You make the best ice cream in the world. Sure you do! Every manufacturer with the right sort of faith in him believes that about his own product. But you are not selling as much of it as somebody else, don't forget yourself and tell folks that the other man is getting away with something. It won't do your business a bit of good to make people believe that anybody in the wholesale industry makes bad ice cream.

Let's stand up for the product we make, fight for its position in public favor, laud it as the most wholesome and palatable food in the world—even if we have to keep silent about a man who, we fully believe deep down in our hearts, is not playing the game fairly and squarely.

The public is pretty fair minded in most cases, and can generally be relied upon to distinguish your cause, if it is right, from "the nation not holy."

SOMETIMES the ice cream manufacturer seems justified in believing that, in his business, conditions are made up of one shortage after another, of shortages and rumors of shortages as it were. First and most misleading was the sugar bugaboo, and often enough we were faced the shortage in the buyer's pocketbook. Now prices fall, with the coal miners' threats heavy on the air.

What will happen in the coal situation? Time and a new president shall have to answer that.

Both the operators and the miners are drawing their breath. The unfortunate part of it is, their arms are pointed toward the public, where the blow, if any be struck, will fall hardest.

If the courage of the new president is as great as we think, maybe we shall see the delightfully strange sight of the government telling the quarrelsome parties in this case that American industries and American citizens have some rights that have not been blocked off by a much amended and contended Constitution of the United States.

However, it seems that the wise course is to lay in for coal now ahead of the heavy demands of fall and

winter. Let them talk about your rights all they want to—but get the coal.

DR. S. H. BAER of St. Louis is back from Europe. While abroad he took occasion to size up the ice cream situation in England, concerning the progress of which so much has been said lately. Dr. Baer sees a long road ahead of the British pioneers in the frozen beverage industry.

The Englishman has no natural ice cream appetite. Perhaps prohibition would make it different. But England will never have prohibition. At least, it is hard to figure out how they would get along with it. Prohibition requires a sense of humor. Where else in the world, except America, are there people willing to laugh and joke about it when somebody takes away something from them that they enjoyed very much—or thought they did, anyhow?

It was nothing but the great, American sense of humor that rescued the situation and induced former lovers of alcoholic beverages to turn to ice cream and other temperance beverages.

The best of it all is, the gentlemen who used to wear corkscrews on their keyrings have found out now that they are having lots more fun than ever before. The man who used to hide a case of Scotch in the closet from the wife and little ones, now walks right in by the front door and puts down a package of ice cream on the refrigerator, and later on joins the family in disposing of it. The companionship in a "Tom and Jerry" is not to be compared with the fine companionship over ice cream plates set for the family.

Sometimes "sense of humor" is just another term for good, old-fashioned common sense.

YOU may swear by all the bearded prophets in Prophetdom—or wherever it is that bearded prophets live—that there is not another line of business in the world that yields so slowly to effort as the ice cream manufacturing business.

You may hold forth at great length on how people fail to appreciate quality goods, and vow to your heart's content that all the rewards seem to settle on the side of the unrighteous.

To people given to earnest thought, life does seem to abound in strange little jokes. And yet if these obstacles were not present, if these handicaps did not exist in some way, if these disappointments did not come before us at least once in a while, living and working would lose much of the salt and savor that have so much to do with making life interesting and making you want to keep looking on to the next trick—and then to the next one. And so on.

But the man with the "goods" eventually wins. All things big in life and business work out slowly, unless you believe what the wildeat oil stock salesmen tell you. Bell was a gray-haired man before his telephone invention was recognized. Peary felt heavy years on his shoulders before he heard the world give him due ac-

claim as the North Pole's discoverer. The author of "Lightning" carried the manuscript in his pocket twenty years before he found a producer who could understand its merit. Our own late President, Warren G. Harding, made his silent, heart-breaking battle and went back to the dust of his fathers just after having tasted the sweets of his life's struggles. For every man that brought back medals of valor from France, hundreds sleep with the poppies under little wooden crosses they have never seen.

All worth-while rewards are slow in coming but if you are running a business that is yielding employment to men and women and enjoyment to many customers, you can well be satisfied to hold to the faith and wait. If some stick it out through gray hairs and the shadows of death, you have no right to be discouraged because Fortune has not loaded you down with riches after your first few splashes toward success. If we simply keep sticking out, success is a matter of course. It comes to some sooner than others, but men who have the goods never fail to win in time.

STEPS by the National Association of Ice Cream Manufacturers to get the views of its members regarding a butterfat standard will be watched with the greatest interest. When the opinion of the majority is ascertained the association's committee on standards will be in position intelligently to voice the views of its associates in appearing before the government bureau designated to handle the matter. Thus far only a few more than 100 members have expressed themselves in the matter. In view of the great importance of the association's purpose, it is greatly to be hoped that the membership will waste no more time in speaking right up and making its voice as a whole understood in the matter.

ICE cream manufacturers of the nation again are about to come face to face with the challenge of opportunity. Folks down Cleveland way are polishing the silverware and washing the window curtains getting ready for company. Those who made the trip last year and walked the gauntlets of mechanical magic displayed, know what to expect of the Exposition to be held there next month. They recognize in it the opportunity to see the agencies at their command for advancing the business of manufacturing and distributing ice cream.

Last year's Exposition was a most startling affair in every way. It attained the high-water mark in arousing the enthusiasm of members of the trade over possibilities for their industry.

This year we are assured that the Exposition will be even greater. There will be more floor space, more exhibitions, more products, more people—and more enthusiasm. All of this we gain from the matter-of-fact announcements by officials of The Association of Ice Cream Supply Men.

Nor is the Exposition all to be considered. In the excitement some of us lose sight of the convention itself.

Few of us fully appreciate the good work the national association is doing in our interest. Some fail to co-operate with the association as we should. This work has for too long fallen on the shoulders of a faithful few. They deserve better support. What reflects upon the many achievements made possible by the loyal, conscientious work of the comparatively small band of men actually serving in the association. Their triumphs appear nothing short of marvelous. Mr. Morris, Loewenstein, and others on the firing line calling upon ice cream manufacturers not just to help but to come and be helped.

Time is passing. Don't fail to shape up your shoulders to go to Cleveland. And, in going, go prepared to lend a hand in every play.

Act now and make your appointment with opportunity.

LAST month was The Ice Cream Review's birthday. On August 1 it began the seventh year of its glorious career. A period of six years is not any great span of time in itself, but six years of steady, conscientious service deserves at least passing comment.

We were content to allow the occasion to pass without calling attention to it. But when the August issue was off the press and we saw Volume No. 1, staring us in the face we could not help but move to pride over the lusty appearance of the "child" that has made its influence so strongly felt for the welfare of the industry in such a short space of time.

Six years and its record of usefulness long since established. Six years and its friends numbered everywhere that men grapple with problems in making and selling ice cream. Six years and the breath of enthusiasm at least as strong as on the day the first issue went to win its way. In six years it has become the most widely read paper in the industry, has become the official organ of 27 associations, and now is published in its home, together with others of the world's greatest publications and dairy exploitation literature.

In the light of what has passed, our friends now will feel that we are justified in expecting great achievements as "The Review" continues to march "in the service of the industry."

WITH two months still to go before time for the convention, the Southern Association of Ice Cream Manufacturers, with the co-operation of its allies, the Dixie Flyers, even now have things sufficiently well shaped up to create the understanding that theirs will be a highly successful convention. Turn to page 106 of this issue and read what Secretary J. Miller, Jr., of the Dixie Flyers has to say about the coming convention. Whether you do business in the East, South or West you can not help being interested in the tremendous enthusiasm and inspiration which those gentlemen of the South move for at the convention.

*Electric
Weld*

SOLDERLESS ICE CREAM CANS

Your late season order will
be filled *Promptly*.

While it is the usual custom to stop making cans in June or July, the unusual demand for "Electric Weld" cans has made it advisable to continue production without a pause.

"Electric Weld" cans are sold direct—Also distributed through Jobbers or our Warehouses in every section of the country.

JOHN WOOD MANUFACTURING CO.
CONSHOHOCKEN, PA.

The Old Process

A Better Made By a

Until our scientists and engineers invented the "Wheel Process" of drying gelatine, all manufacturers made what is called "Tunnel Dried Gelatine"—the usual granulated gelatine daily offered you.

By this Tunnel Process, the gelatine goes from the cooker through the filters, and in best equipped modern factories to a chilling, cutting and spreading tunnel, and is deposited on nets to dry. This drying operation is accomplished by passing these nets through a series of cold and hot tunnels and blowing millions of cubic feet of air over the thin film of gelatine. In spite of the fact that the air is usually filtered and washed, all dirt and dust cannot be excluded and the gelatine is contaminated thereby.

Furthermore, the temperature in the drying tunnel is just right to promote the rapid growth of bacteria

As leaders in the world's production of gelatine, it is only natural that we should also lead in the development of new processes and equipment for the improvement of edible gelatine—the result is our Wheel Dried Process—the greatest advance the industry has ever known. Instead of exposing the gelatine to the air from 16 to 48 hours, as in the tunnel process, it is packed in barrels in less than 10 minutes from the time the liquid gelatine leaves the cookers.

There is no comparison between Wheel Dried and Tunnel Dried Gelatine in purity and bacterial count. We know, for we make both kinds and test them continually. Wheel Gelatine is free from dirt. It is also free from harmful bacteria. And our customers were not long in discovering

No. 1 shows the filtering process from which the liquid gelatine goes through the cooling tunnels where it is deposited on aluminum nets (Fig. 2) and dried by enormous volumes of air as it passes through a series of hot and cold drying tunnels (Figs. 3 and 4). The dry gelatine is then knocked from the nets (Fig. 5); put through crushers, and packed for shipment. 16 to 48 hours are required to complete this process.

Ucopeno Pure

The New Process

Gelatine Better Process

ing the difference, for now more than 90% of them demand Wheel Gelatine, and the balance are rapidly turning to it.

o great is the improvement in the product that two of our leading competitors have already made overtures to us to permit them to make Wheel Gelatine on a royalty basis.

COPCO Wheel Gelatine costs no more than ordinary gelatine, but the superiority of the product is readily apparent. Let us send you a sample. Test it. Compare it with any other gelatine on the market. You will be surprised at the improvement it will make in our marshmallow, ice cream, or in any other food product.

By our Wheel Drying Process, the liquid gelatine from the filters (Fig. 1) is piped directly to the wheel (Fig. 2), where it is dried and packed. This is done in less than 5 minutes.

Food Gelatine

Survey of Ice Cream Laws of Different States

By D. H. LUCAS*

DUE to increased interest in ice cream control shown of late, an operative questionnaire of fourteen sections was sent to enforcement departments throughout the United States to enable a comparison of methods in vogue at present. Taking this questionnaire as basis for this report we will consider each section separately with resulting information detailed as far as possible. Out of 47 states, replies from 37 were received as follows:

Section I—"What are Standards set for Ice Cream in Your State as to (a) Fat?"

The average butterfat of all states was 10 per cent with 10 states having this for plain cream. Of these, Arizona, California, Michigan, Kansas and Kentucky are some of the largest, and perhaps most active, in ice cream control. The highest butterfat was 14 per cent, or government standard for plain mix found in 7 states with no active control; the lowest of 7 per cent was in one state divided into municipal control laws by state board of health, but as a fact this ice cream generally runs from 10 to 12 per cent. Sixteen states require 8 per cent, while three held 12 per cent. The average of fruit or nut ice creams was 8 per cent, or an average of 2 per cent leeway found in fifteen states, including above mentioned states. Twelve per cent was highest in states using government standard, while 6 per cent was lowest, found in Maryland, New Jersey, Pennsylvania and Tennessee, which states held 8 per cent for plain cream, but stated their usual tests were found to be 10 per cent or better for plain. The trend of all remarks held that 10 per cent for straight flavor cream and 8 per cent for fruit or nut mix seemed to be the run of larger manufacturers.

(b)—"Solids not Fat?"

Eleven states have standards ranging from 10 per cent to 24 per cent, with an average of 18 per cent. West Virginia was lowest of 10 per cent, while Arizona, Kansas and Oregon have 24 per cent; Montana, 23 per cent, and Oklahoma, 22½ per cent. Illinois, Maryland, New York, Tennessee and Washington have 18 per cent. From the experience of some of today's largest manufacturers it seems that for a 10 per cent fat that a 24 per cent solids is necessary for the best ice cream. Comments covering these two points from several states suggest that with a set butterfat the manufacturer will bring his solids up to requirements, but the experience of the writer has been with twelve plants for the past year that this is not so, for without a solids standard the trend is always to cut down on solids and jeopardize the smoothness and food value of their product.

(c)—"Weight per Gallon?"

Three states have standards of 4¼, 4¾ pounds to half original volume. Personally believe that a 90 per cent over-run gives best cream or a weight of 5 pounds per gallon, approximately.

(d)—"Bacteria?"

Five states have a standard of not over 500,000 bacteria, with a limit on B coli. Believe this to be a satisfactory standard. These states are Florida, Georgia, Kentucky, Mississippi and Montana.

* Health Commissioner, Birmingham, Ala.; contributed to The Ice Cream Review.

(e)—"Is a Distinction Made Between Straight Flavor Mix and Fruit or Nut Creams as to Fat?"

Twenty-one states advocate a distinction, some have no distinguishing standard.

Section II—"What Department or Bureau is Charged with the Enforcement of Law and How are Inspections Made?"

Fifteen states have bureaus of agriculture responsible in conjunction with a dairy and food commission while six states hold the state boards of health responsible. I believe the more active states with largest

ATTRACTIVE AND EFFICIENT

GOOD DESIGNING both inside and outside, lends a two-fold advantage to your business. Sales increase and operating costs decrease. Can you afford to disregard a service which brings you this advantage?

For many years this organization has devoted its entire time to the planning of low operating cost Dairy Plants which have been accepted as models of efficiency by the industry.

Let us show you how your plant can be improved.

William H. Timm

Engineer and Architect
for the
Dairy Industry

Perry Building PHILADELPHIA

Two states have both tax and regular appropriation, while one has all three forms.

Section VI—"What are Provisions of Law as to Return of Containers?"

Twenty-two states have specific laws as to washing before return—eleven have no laws to date, but realize the necessity of same; in fact, a number of states mentioned bills for present legislature.

Section VII—"Is this Complied with by Public?"

Fifteen states were very well satisfied, the balance were unable to state satisfactory due to limited number of inspectors.

Section VIII—"Is it Enforced?"

Thirteen states reported favorably, while some were handicapped by appropriations and left enforcement a matter of honor.

Section IX—"What Penalties are Imposed for Non-compliance?"

The fines run from \$5 each container, to \$10, \$25, \$30, \$100, as case is considered by the authorities. Ice cream penalties vary from \$25 to \$500 each.

Section X—"Is there a Provision for Scoring Plants, and What?"

Twelve states score plants, while eighteen do not. In this connection have worked out personally a score card as efficient in covering all points of any plant as the present government milk plant score card. The trend of all states runs to sanitation scoring, with no emphasis on plant conditions. Of the twelve plants under my jurisdiction all favor a score system, with monthly publication as a business advertisement, let alone the value received of being made to keep their plants up to the mark.

Section XI—"What Methods of Analysis are Used, and What is Ice Cream Tested For?"

The A. O. A. C. methods predominate in all states with tests for fat and solids as individual law dequires, also adulteration and color used. States with bacteria requirements run plate counts and an isolation of B coli colonies.

Section XII—"What Ingredients Permitted?"

All pure milk products, sugar, flavoring, pure food coloring, gelatine (limited) vegetable gums (limited) powders and stabilizers.

Section XIII—"What Ingredients Barred?"

All injurious and deleterious substances hold the majority of thirteen states; others specify starch, saccharine, fats other than butter, added color other than pure food colors; foreign oils, preservatives; paraffine, cocoa butter, other than in chocolate.

Section XIV—"What Laws are Available?"

Thirty-two states either have direct laws regarding ice cream or govern same from pure food or sanitary amendments. Four states use the United States pure food and drug laws.

Remarks.

Several states require ice cream under requirements of standards to be marketed as "Imitation," "Gum," "Gelatine," "Egg," "Home Products Ice Cream," etc.

Bacteria generally run under limit unless a unsanitary condition is present for which plant closed until rectified.

Sources of revenue are obtained in various some of which are the following:

Tax on gallons capacity.

Tax on number freezers.

Manufacturer's tax \$25, and individual retailer \$5 each.

Tester's licenses where milk and cream are brought under B. F. test.

Fines reverted to department use.

Fees paid by individual manufacturer for inspection by state.

Summary of Survey.

The best standard for ice cream mix, as estimated from above survey, seems to be B. F., 10 per cent solids not fat, 24 per cent, of which at least 10 per cent should be serum or milk solids; total solids, 34 per cent weight per gallon, not less than 5 pounds; bacteria limit of 500,000 bacteria per c.c.; gum tragacanth, gelatine, not over one per cent by weight; no color matter other than national pure food colors, vegetable and not coal tar dyes. No starch, saccharine, fats, other than butter, foreign oils, preservatives, paraffine, cocoa butter, other than in chocolate, to be allowed. Also deleterious or injurious ingredients to be allowed.

Fruit and nut ice creams allowed 8 per cent butter fat with at least 24 per cent solids not fat.

It is quite evident that ice cream control laws are in their infancy, for a number of states mentioned the desires of bringing up their present laws to a standard capable of being of some service to the community. Proper scoring of plants for manufacturer's own benefit is getting serious consideration, as the present system takes sanitary conditions only and does not dig into plant operations efficiently. This is also due to inexperience of inspectors that are employed perhaps in many instances.

Can laws for return of clean containers are also coming into prominence, with more emphasis being put in investigations and inspections.

GIFFORD PINCHOT TO ADDRESS DAIRY CONGRESS DELEGATES.

Gifford Pinchot, governor of Pennsylvania, will be the principal speaker at the banquet with which the dairy and civic interests of Philadelphia will entertain the delegates to the World's Dairy Congress on the evening of October 4. The Congress, after holding its opening sessions at Washington, D. C., on October 2 and 3, will adjourn to Philadelphia, where it will be the guest of the National Dairy Council and the civic interests for a day, before proceeding to Syracuse, N. Y., where its concluding sessions will be held in co-operation with the National Dairy Exposition. The Council has prepared an elaborate program for explaining to the delegates, many of whom will come from other countries, how it promotes a wiser use of milk and milk products. The banquet of the evening will be one of the features. Governor Pinchot sent word that he would welcome the delegates to Philadelphia through F. J. Willits, secretary of agriculture for the Commonwealth and Executive Committeeman of the Inter-State Milk Producers' Association—one of the organizations allied with the Council.

See What The Genius of Man Has Created in Dairy Machinery

Partial View of Machinery Exhibit at 1922 Exposition

MARVELOUS machines that handle automatically almost every process in the making of butter, ice cream, cheese, or preparation of market milk, will be shown in bewildering array at the 1923 NATIONAL DAIRY EXPOSITION. Every leading dairy machinery manufacturer in the country will exhibit one or more of each machine he makes and courteous dairy plant engineers will explain in detail each unfamiliar feature without asking you to buy.

Here you will be able to inspect machines which will wash 600 milk or ice cream cans per hour; here are machines which will bottle and cap 3500 quart bottles of milk per hour; here are giant churns which will produce 1200 lbs. of butter at one churning and work it in the same machine; and here also are large freezers which will make 120 quarts of delicious ice cream in 15 minutes.

Every man who is ambitious—who wants to keep up with the latest inventions in dairy equipment—who wants to reduce his labor costs or improve the quality of his product—will learn more from a short visit to the NATIONAL DAIRY EXPOSITION than he can learn in a year in any other way.

NATIONAL DAIRY EXPOSITION

Syracuse, New York, October 5-13, 1923

Gelatine—Viscosity and Melting Resistance

By V. C. MANHART*

A VERY general complaint among ice cream consumers during the hot days and evenings of summer is that the packaged cream they buy is spongy, and does not make a pleasing appearance when served. Another complaint is that the cream melts too rapidly when served. So long as brick ice cream is sold at the corner drug store and the consumer carries it home without being iced, this complaint will never cease. However, quite often neither the dealer nor the consumer is at fault. It may be that the dealer has kept the cream iced properly, and the consumer has not permitted too long a time to elapse before the cream is served. If this be the case, the manufacturer has failed to produce a product with sufficient melting resistance.

Viscosity of the mix as affected by gelatine is a factor influencing the melting resistance of ice cream. Ice cream made from a mix relatively high in viscosity stands up better and melts slower when exposed at room temperature for a period of sixty minutes, than does ice cream made from a less viscous mix.

Gelatine and Viscosity.

There exists a wide difference in the viscosity of aged, emulsified ice cream mixes of like composition, but containing different gelatines. From a number of samples of edible gelatines, three gelatines, numbers 1, 2 and 3 were selected. When these gelatines were added to the mixes at the rate of 0.6 of 1 per cent, gelatine No. 1 increased the average viscosity of the mixes 140 per cent over that of the control, the viscosity of which was 1.715, (comparative to that of water at 15 degrees C.); while gelatine No. 2 produced an increase of 595 per cent, and gelatine No. 3 showed an increase of 869 per cent.

TABLE I.
Relative Influence of Gelatines on Viscosity of Ice Cream Mixes.

Mix containing	Viscosity comparative to water at 15°C.	Present inc. in viscosity of gelatine mixes over control mix
No gelatine (control mix)	1.715 (aver. of 10 mixes)	...
Gelatine No. 1	4.128 (aver. of 7 mixes)	140
Gelatine No. 2	11.93 (aver. of 5 mixes)	595
Gelatine No. 3	16.626 (aver. of 5 mixes)	869

Table I, illustrating the relative influence of gelatines on viscosity, shows that gelatine No. 2 increased the average viscosity of the mixes nearly three times that of similar mixes containing gelatine No. 1, and that the mixes containing gelatine No. 3 were nearly four times more viscous.

Melting Resistance.

The method used to determine the relative influence of the three gelatines upon the melting resistance of ice cream was as follows:

Representative samples of the ice creams containing the three gelatines, as well as of the control, which contained no gelatine, were run into twelve ounce cartons. These cartons were then placed in a hardening room where they remained twenty-four hours. The cartons were then removed from the ice creams, each of which was placed on a wire mesh over the mouth of a glass funnel. These funnels containing the ice cream were placed in a chamber kept at a temperature of 86 degrees F. The melted ice cream ran from the funnel into a

beaker and was weighed at the expiration of 30, 50 and 60 minutes.

Viscosity an Important Factor.

The results of the experiment show that the containing gelatines which produce relatively high viscosities make an ice cream possessing greater melting resistance than mixes containing a gelatine which does not have the property of greatly increasing the viscosity of the mix.

TABLE II.

Relative Influence of Gelatines on the Melting Resistance of Ice Cream.

Ice Cream Containing	Per cent Ice Cream Melted at end of			
	30 min.	40 min.	50 min.	60 min.
No Gelatine.....	9.80	16.66	24.56	33.32
Gelatine No. 1.....	5.55	14.43	26.65	38.89
Gelatine No. 2.....	0.26	2.86	12.23	24.45
Gelatine No. 3.....	0.26	2.35	8.60	19.05

An inspection of Table II, illustrating the relative influence of gelatines on the melting resistance of ice cream, shows that at the end of a thirty minute exposure nearly 10 per cent of the control and slightly over 5 per cent of the ice cream containing gelatine No. 1 had melted, while only a small fraction of 1 per cent of the two ice creams containing gelatine No. 2 and gelatine No. 3 had melted.

The control started to melt almost immediately after being removed from the container, and as the melting progressed, the exterior surface of the ice cream became spongy with a solid core on the inside. It retained its original shape during the entire melting period, with the exception that the top extended slightly beyond the sides. Not only did it retain its original shape, but it was of the original size as well, in spite of the fact that it had decreased 33.32 per cent in weight. Consequently at the end of the melting period it was a spongy mass, consisting mostly of air with a small core of ice cream in the center.

The ice cream containing gelatine No. 1 did not commence to melt until it had been exposed to the room temperature for about twenty-three minutes; thereafter it melted rapidly and readily sloughed away. The appearance of the ice cream during the melting period was in striking contrast with that of the control. The two ice creams containing gelatine No. 1 and gelatine No. 2. Near the completing of the period of exposure, the upper edge rounded off and the original cylindrical shape became hemispherical. The surface became very smooth and regular with a high gloss. This appearance of the melting ice cream is very similar to that of ice cream containing gum tragacanth.

There was but very little difference in the melting resistance and the body characteristics while melting the two ice cream containing the other two gelatines. Melting was scarcely noticeable until after the expiration of forty minutes exposure and thereafter was rapid, the ice cream containing gelatine No. 3 melted slightly slower than that containing gelatine No. 2.

Both during the first sixty minutes melted much slower than the one containing gelatine No. 1. They like the control retained much of their original shape but not nearly so much of their original size. The gelatine No. 2 ice cream showed a tendency to slough away which was not observed of the gelatine No. 3 ice cream. Like the control, but not nearly so much, they

became slightly foamy. The surface of each was spongy and porous and presented a dull appearance.

Quality of Gelatine.

The amount of gelatine necessary to produce cream that will stand up well for a reasonable and not melt too rapidly seems to be determined by the viscosity it will produce in the mix. The average viscosity of the mixes which contained 0.6 of 1 per cent of gelatine No. 1, was 4.128, while the average viscosity of the mixes which contained 0.6 of 1 per cent of gelatine No. 2 was 11.93. It was found that when the amount of gelatine No. 2 used in the mix was reduced to 0.4 of 1 per cent, that the viscosity of that mix was practically the same as the viscosity of the mix containing 0.6 of 1 per cent of gelatine No. 1, and the melting resistance and standing up properties of the hardened ice creams from the two mixes were practically identical.

TABLE III.

Melting Resistance of Ice Cream Containing 0.6 of 1 per cent of Gelatine No. 1, and 0.4 of 1 per cent of Gelatine No. 2.

Mix Containing	Viscosity	% ice cream melted at		
		30 min.	40 min.	50 min.
Gelatine No. 1.. 4.06 (aver. of 6 mixes)		5.24	17.42	31.08
Gelatine No. 2.. 4.42 (aver. of 4 mixes)		5.17	15.40	30.00

Table III, illustrating the relative influence of different amounts of gelatine on viscosity and melting resistance when used in different amounts, shows that 0.4 of 1 per cent of gelatine No. 2 will produce as high a viscosity in the mix as 0.6 of 1 per cent of gelatine No. 1, and the ice creams possess equal melting resistance.

NOTE:—The three gelatines used in the experiments were sold at practically the same price per pound.

O'CONNOR BUYS INTEREST.

Thomas O'Connor, better known as "Tommy", has purchased an interest in the Crawford County Creamery Company, Pittsburgh, Kans., which is engaged in the manufacture and wholesale distribution of ice cream and butter.

"Tommy" has been foreman and superintendent of the Snyder Ice Cream Plant at Wichita for the last 10 years. He took over the superintendency of the plant about July 15.

No doubt, Mr. O'Connor's ability as an ice cream maker coupled with the reputation which the Crawford County Creamery ice cream has, will be able to place the plant as one of the foremost in the state in quality and in a few years time, in quantity of their output.

B. F. Perkins, secretary-treasurer of the Kansas Ice Cream Manufacturers Association, is president and general manager of the Crawford County Creamery Company, manufacturers of the 4-C Brand of ice cream.

Lest You Forget!—The 23rd annual meeting of the National Association of Ice Cream Manufacturers will be held in connection with the second national exposition of The Association of Ice Cream Supply Manufacturers, Cleveland, October 22-27 inclusive.

Send news items and personal notices to the "Review" and see how well they look in print.

MEXICO INTERESTED IN SCIENTIFIC DAIRYING.

an evidence of the awakening of Mexico, after a long period of internal disturbances, to the value of scientific methods in the production and handling of milk, a commission of Mexican agricultural engineers are now making a year's tour of the world to get first-hand knowledge of the means employed in other countries. For a fortnight, two members of the commission remained at Washington, D. C., to make a study of the dairy division and the activities of the Department of agriculture. These were Gonzalo Robles and Juan Ballesteros. Senor Robles explained the Mexican dairy situation, while visiting the offices of the United States Dairy Congress Association. The Congress Association has extended personal invitations to all Mexicans interested in dairying and many are expected to attend the meeting. The congress will hold its open sessions at Washington, D. C., on October 2 and 3, and then to Philadelphia, Pa., for October 4 and 5, and finally at Syracuse, N. Y., from October 5 to 10. Senor Robles said:

In Mexico, the dairy industry is growing every year, especially around the cities. We have not yet begun to gather statistics as to the number of dairy cows. A year ago, the Animal Husbandry Department was organized as a separate entity. It has a dairy division. A year ago, also, a modern, scientific milk plant was established at San Jacinto, near Mexico City, as a demonstration school. It has electrical machinery, a pasteurization plant, a cheese plant and a creamery. The teachers are graduates of the Agricultural College of Mexico City. Many girls are taking short courses in dairying. I found one teaching at the Escuela Conde de Pozos, Cuba, as I came northward. We have had sanitary agents two years. They now number 40 and are doing fine work in some places.

Most of our cows are Holsteins from the United States. Before the war, we imported cows of all sorts; now we have only two breeds. Jerseys are kept for fancy milk. In importing cattle from the northern States of the United States, we have had no trouble, as the dairying in Mexico is carried on in the highlands, where the climate is cool. This is practically the best dairying in our lowlands. Mexico City has a large quantity of milk; but little of it is pasteurized. Most of the milk is sold loose at stores, but some is distributed in bottles. Milking machines are finding their way into Mexico. However, we lack scientific and sanitary control of milk production and distribution and we desire to see what other countries are doing in these respects. We are particularly interested in co-operative efforts. Our government recently established a Department to foster the formation of co-operative organizations."

MILLION-DOLLAR CREAMERY PLANT CONTEMPLATED.

Following out a program of extension and improvement of Southern California plants, the Crescent Creamery Co., of Long Beach, Cal., will soon begin construction of a million dollar creamery at South San Fernando road, Glendale, Cal.

According to plans, the plant will be erected on a one and one-half acre site which was recently purchased there. In addition to this the company bought a number of building lots, and it is understood that houses will be constructed there for their employees.

It is stated that the new building will cost \$500,000 and the equipment will cost a like amount.

MENTION "THE REVIEW"—IT IDENTIFIES YOU.

Reduce Bacteria Count

Buy one of these cells—

- Put salt water in it.
- Turn on current of electricity.
- Product is Sodium Hypochlorite.
- Keeps down stale milk odors.
- Reduces bacteria count.
- Bacteria count is the index of quality.
- High quality increases business.

Following is a City Bacteriologist's report on a big ice cream plant using this Hypochlorite freely:

	Bacteria per C. C.
Mix No. 3 Chocolate	3,000
Mix No. 4	1,000
Vanilla Ice Cream	2,000
Peach Ice Cream	1,000
Strawberry Ice Cream	2,000
Chocolate Ice Cream	4,000
Harlequin Ice Cream	2,000
"Milco"	1,800

CAN YOU BEAT IT?

Write for bulletins.

The Electro Chemical Company

Dayton, Ohio - - U. S. A.

PROFESSOR BAER'S INQUIRY DEPARTMENT

Dear Sir:—We are enclosing ice cream mix which we are using at present. It is giving very good satisfaction, but we want to know if we can improve on it. We use the very best materials possible and want to make the highest grade of ice cream, regardless of expense. Would it be advisable to use more butterfat?

P. S.—Can you give us formula for French vanilla? Is it simply vanilla with eggs added?

Ice Cream Formula.

100 lbs. cream, 35 test.
200 lbs. milk, 3.6 test.
48 lbs. sugar.
7½ lbs. condensed skim.
21/7 lbs. gelatine.

Reply: You will find the analysis of your mix given below in table one, and I am suggesting in table two how your present mix might be improved upon, especially by using a little more milk serum solids.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
100.0 lbs. 35% cream.....	35.00	5.79	40.79
200.0 lbs. 3.6% milk.....	7.20	17.16	24.36
48.0 lbs. sugar.....			45.60
7.5 lbs. condensed skim.....		2.02	2.02
2.2 lbs. gelatine.....			2.09
357.7 lbs.	42.20	24.97	114.86
Per cent.....	11.8	7.0	32.1
Per cent sugar.....	13.4		

Table 2.

Ingredients	Fat	Serum Sol.	Total Sol.
56.0 lbs. sugar.....			53.20
2.0 lbs. gelatine.....			1.90
40.0 lbs. skimmed condensed..		10.80	10.80
119.0 lbs. 35% cream.....	41.65	6.87	48.52
183.0 lbs. 3.6% milk.....	6.58	15.67	22.25
400.0 lbs.	48.23	33.34	136.67

Ice cream should have at least 20 per cent total milk solids, which includes the butterfat and serum solids.

* * *

Dear Sir:—Could you give us a formula for a 14 per cent ice cream, as we understand state law calls for a 14 per cent cream?

We are using, for a five gallon mix; 18% sweet cream, 3 pounds sweetened condensed skim milk, 42 per cent sugar, and 70 to 72 per cent total milk solids, 1 oz. Washburn's ice cream improver, 7 pounds sugar, 7 ozs. gelatine, 2 ozs. pure vanilla.

Reply: I have noted your ice cream formula which you stated you are using for a five gallon mix, and I have analyzed it below. You will notice that you had 15 per cent butterfat all right, but your total solids were very high due to an excessive amount of sugar.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

Your Mix.

Ingredients	Fat	Serum Sol.	Total Sol.
7.0 lbs. sugar.....			
3.0 lbs. sweet condensed.....		.84	
.5 lbs. gelatine and improver.....			
39.5 lbs. 18% cream.....	7.1	2.85	
50.0 lbs.	7.1	3.69	19.8
Per cent.....	7.4	7.4	38.8
Per cent sugar.....	18.5		

I am suggesting in table one how your formula might be worked over for a lower cost, and also I believe for better results.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
5.0 lbs. sugar.....			4.5
5.0 lbs. sweet cond. skim.....		1.40	3.0
39.75 lbs. 18% cream.....	7.15	2.90	10.05
.25 lbs. gelatine and improver.....			3.0
50.0 lbs.	7.15	4.30	18.3
Per cent.....	14.3	8.6	37.3
Per cent sugar.....	14.0		

I notice further that you were using seven ounces gelatine, along with an ounce of improver for your mix. Unless you are using a very poor quality of gelatine that amount is very excessive. It is not necessary to use over a half pound of gelatine for one hundred pounds of ice cream or for twenty gallons of ice cream.

After you try out the mix given in table one, I shall be glad to hear from you as to the results. I shall be glad to assist you in any way to get the right mix in your ice cream department.

* * *

Dear Sir:—We have just installed a vacuum condenser and are making condensed milk. We also want to get into the market of manufacturing and selling ice cream mixes. We understand this is being accomplished in certain sections of the country. We do not know how they handle it, but it seems as though they put the entire mix into a pan and then condense it down to a certain per cent of solids.

Reply: You probably have noticed that the Ruff Condensing Company of Port Huron, Michigan, has been experimenting with the condensing of materials for ice cream mix by putting the entire mixture into a condenser and then condensing it down to a standard weight for a given per cent of butterfat and solids.

I suggest that you write to the Ruff Condensing Company, Port Huron, Michigan, for a copy of their pamphlet entitled, "One Hundred Practical Ice Cream Formulas."

To illustrate how the Ruff people are doing this, I am glad to quote below from page 113, ice cream formula No. 81: To make 900 pounds of ice cream mix testing 12 per cent butterfat, 11 per cent serum solids, 12.5 per cent sugar and 36 per cent total solids. To make this mix the following ingredients are put into the condenser:

You Need Never Worry

Atlantic super-clarified Gelatine passes the pure food requirements of all states in the Union. It is the highly-perfected process of making, together with the use of only the best raw materials, that has enabled us to supply our trade with gelatine of unexampled purity and clarity and high viscosity. Safeguarding our customers in this way has made our manufacturing costs slightly higher, but still our gelatine sells at less than ordinary gelatines of corresponding grades.

The test tube at the left contains Atlantic Super Clarified Gelatine. Note its clarity —its high viscosity.

**"Purest and Best —
It Stands the Test"**

**Try It Out!
FREE!**

Make the test of trying out our gelatine by ordering a barrel from the nearest office. Use five or fifteen pounds and if it doesn't match up with our claims for it, send the unused portion back. We will pay the freight both ways.

It costs *less* and it does *more*.

Concerns who have standardized on Atlantic super-clarified Gelatine are assured of uniformly high quality and texture to their product.

Atlantic Gelatine Company
WOBURN, MASSACHUSETTS

Branches:

Chicago: Suite 510, 118 N. LaSalle Street
New York City: Room 1081 Woolworth Building

ATLANTIC ^{Super-Clarified} GELATINE

1051.7 pounds 3.5 per cent milk.
178.0 pounds 40 per cent cream.
118.4 pounds sugar.
4.5 pounds gelatine.

1352.6 pounds.

From this, 452.6 pounds must be evaporated, which leaves 90 pounds of ice cream mix. If you figure this out you will note that the ice cream mix will have the composition as indicated above.

As far as I know no experiment station has conducted any experiments with the condensing of an ice cream mix.

I might suggest, however, that you write to the Illinois Agricultural Experiment Station relative to this matter. They have a vacuum pan condensor at the University of Illinois, and it is possible that they have tried this out.

* * *

Dear Sir:—Will you please advise me what acidity is the best for pasteurizing ice cream mix and where the danger point is of acidity of mix which is liable to curdle. Also advise what acidity mix should contain when freezing, and if acidity will increase or decrease the overrun in ice cream freezing.

Reply: The acidity of an ice cream mix as tested by the regular burette method, using Mann's reagent and indicator, varies with different ice cream mixes, depending upon the per cent of serum solids in the mix.

Before pasteurizing the acidity of the mix had not better be higher than .25 per cent providing some extra milk solids either in the form of condensed milk or milk powder is used. Sweet milk should not have an acidity

VIKING—The Practical Pump

For pump users who demand dependability and economy of operation.

The VIKING is self-priming and delivers a steady stream under varying heads. This eliminates all splashing and pounding.

Only two moving parts—no valves, springs or other trouble-makers.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

over .20 per cent. Sweet cream not over .17 or .18 per cent. If these acidities are higher they are apt to cause trouble on pasteurization.

It is not necessary to develop an acidity in the cream mix to get the overrun and no ice cream factory can afford to take any chance on trying to ripen the mix or to increase the acidity while the mix is being aged. Proper aging of mix, keeping it at a low temperature between 35 to 45 degrees for 24 to 48 hours will give sufficient viscosity so that no increase in the acidity is necessary to get the overrun. An ice cream mix should be kept as sweet and pure as possible from the time it is processed until frozen.

* * *

Dear Sir:—Last year I made a raw mix and had any trouble, but this year I am viscolizing my tire mix, except vanilla. After the mix has cooled to 36 degrees F. it gets so very thick that it will not flow through a 2-inch sanitary pipe.

I run the batch when it reaches 118 to 120 degrees and at 1200 to 1400 pounds pressure, it comes off the coils at 78 degrees F. and I cool it down in the storage tank to 34 to 36 degrees and then it begins to get the like mush.

I desire to have not less than 12 per cent butter and 36 to 37 per cent total solids.

Using butter, milk powder, water, and skim condensed milk. If you can tell me of any way to come the mix getting so thick I would greatly appreciate it. I use a medium grade of gelatine and gum

Butter, 84%	1429
Skim milk	2100
Sugar	1400
Skim cond. milk 33% milk solids not fat	1650
Skim milk powder	272
Water	3026
Gelatine, 700 oz.; gum, 100 oz.; vanilla extract, 1128 oz.; cheese color, 45 oz.	123

10000

Reply: I am showing below in table one the calculations analyzing your mix. Your trouble in having your mix very thick so that it will not flow through a two-inch sanitary pipe line is due probably to two conditions. One being the high per cent of solids in the mix and the other too much gelatine and gum for the amount of solids. A total solids of 34 to 35 per cent is plenty high, and it is in my opinion undesirable to have as high as 37 per cent total solids.

I suggest that instead of using both the gelatine and gum you try either to reduce the amount of gum materially or eliminate it entirely and see if your mix will not flow through your pipe line. If that will not eliminate the difficulty you should reduce the amount of gelatine until you find that it will flow through your pipe. I believe, however, if you will cut out the gum which may contain, according to your description, a little pepsin or rennet you will not have any further trouble.

Table 1.

cent serum solids along with 12 per cent butterfat. This would mean that you could materially reduce either the amount of skim condensed or the amount of skim milk powder, or both. If you do not desire to reduce the milk serum solids you can eliminate your trouble by reducing the amount of stabilizer.

You stated further in your letter that you kept your mix in the storage tank at a temperature of 34 to 36 degrees. A temperature of 40 degrees or from 35 to 40 degrees is low enough for the storing of the mix.

Dear Sir:—I am at some little loss as to a proper formula, and if convenient I would appreciate your giving me a little information, as follows:

Formula 1—100 lbs. mix, using 32½ lbs. at total solids. Ingredients: whole milk, butter, powdered milk, gelatine, flavor, etc.

Formula 2—Same as above, only 34 per cent total solids.

Formula 3—Same as the others, only 35½ per cent total solids; but instead of all whole milk we want to add about 25 per cent sweetened skim milk (condensed).

Aside from showing the total of each I would like you to figure out each formula, showing the whole transaction in figures, or at least giving the total of each step in the transaction.

We figure our fat solids in milk at 3.5, total solids in butter at 84, milk powder, 95, sugar 95, gelatine 95%.

Thank you very much for the above information.

Reply: I am suggesting below, in table 1, 2 and 3, three formulas calculated according to your suggestions. I am assuming that you wanted all three formulas to test 10 per cent butterfat and No. 1, 32.5 per cent total solids; No. 2, 34.5 per cent total solids, and No. 3, 35.5 per cent total solids.

"CHICAGO" CAN LINER

Table 1.			
Ingredients	Fat	Serum Sol.	Total
13.0 lbs. sugar.....	12.0
.5 lbs. gelatine.....
3.8 lbs. skim powder.....	3.60	3.6
8.8 lbs. 84% butter.....	7.39	7.39
73.9 lbs. 3.5% milk.....	2.59	6.41	9.0
100.0 lbs.	9.98	10.01	32.5

Table 2.			
Ingredients	Fat	Serum Sol.	Total
14.0 lbs. sugar.....	13.0
.5 lbs. gelatine.....
4.2 lbs. skim powder.....	3.99	3.99
9.0 lbs. 84% butter.....	7.56	7.56
72.3 lbs. 3.5% milk.....	2.52	6.30	8.8
100.0 lbs.	10.08	10.29	34.1

Table 3.			
Ingredients	Fat	Serum Sol.	Total
6.04 lbs. sugar.....	5.7
.5 lbs. gelatine.....
20.0 lbs. sweet cond. (27% S. S., 40% sugar).....	5.40	13.4
2.2 lbs. skim powder.....	2.09	2.0
10.0 lbs. butter.....	8.40	8.4
45.0 lbs. 3.5% milk.....	1.58	3.87	5.4
16.3 lbs. water.....
100.0 lbs.	9.98	11.36	35.5

If there is anything about these three formulas the calculations which you do not understand, I shall be glad to assist you in any other way I can.

Dear Sir:—Our ice cream maker thinks that we are using too much sweetened condensed and that it is keeping down the overrun, but I think the mix does not get aged enough.

We have no viscolizer and the mix when it is frozen is about 48 hours old. We hold it in ten-gallon cans packed in ice and salt. We try to get 100 per cent but only get from 85 to 95 per cent.

We have to cut the fat content down in our ice cream and are trying to make a 12 per cent fat instead of 14. We are using 16 per cent cream, 5.0 lbs. sugar, 5.0 lbs. sweetened condensed, 40 to 42 per cent sugar, 70 to 75 per cent total solids, 4 oz. gelatine and improver.

The above being to the 5-gallon batch.

Reply: I am indicating below the amount of solids which you have in your present mix. I believe that the difficulty which you have in getting a satisfactory overrun is due to a high per cent of sugar which makes your total solids very high.

Your Mix.			
Ingredients	Fat	Serum Sol.	Total S.
5.0 lbs. sugar.....	4.75
5.0 lbs. sweet cond.....	1.4	3.50
.25 lbs. gelatine and improver.....21
34.75 lbs. 16% cream.....	5.56	2.60	8.16
45.0 lbs.	5.56	4.00	16.62
Per cent.....	12.4	8.8	37.0
Per cent sugar.....	15.7

I am suggesting below in table 1 how I would change your formula, reducing the amount of sugar and increasing the per cent of serum solids. This means, of course, an additional amount of sweetened condensed.

Table 1.			
Ingredients	Fat	Serum Sol.	Total S.
3.3 lbs. sugar.....	3.13
7.0 lbs. sweet cond.....	1.96	4.90
.25 lbs. gelatine and improver.....21
34.45 lbs. 16% cream.....	5.51	2.60	8.11
45.0 lbs.	5.51	4.56	16.35
Per cent.....	12.2	10.01	36.3
Per cent sugar.....	13.9

You will notice that I have made your batches weigh

What Makes One Door Better Than Another?

WITH "Your Plant Only as Good as Your Door" it is an equal fact that the door itself is only as good as its hardware.

In the hardware lies one door's advantage over another! It is on the hardware that the door swings. It is the hardware which is responsible for efficient shutting. The difference in hardware helps to make the difference in doors.

Jamison Cold Storage Doors — sturdily built of heavy materials and properly insulated — are fitted with hardware embodying patented features owned exclusively by us—hardware heavy enough to "carry the load" and complete the job of the door. Hardware that is guaranteed against breakage in line of duty. Hardware that keeps your plant "in commission" and out of repair shops, with attendant loss of time and money.

Adjustable Spring Hinges and Automatic Self-Tightening Fasteners Are Some of the Jamison "Strong Points"

Both of these "strong points" are exclusively Jamison's. The Adjustable Spring Hinges enable you to keep the door forced tight against the double seals of contact at all times—regardless of shrinking, swelling or wear—through the process of a simple adjustment.

The Self-Tightening Fastener is a massive device of great strength and power that requires but a slam of the door to force it perfectly tight, at the same time exerting constant inward pressure on the door. This Fastener closes the door to stay—it cannot re-open through the force of a slam!

Catalog No. 10 fully describes the various Jamison Patents which give Jamison Products their superiority. You'll find it interesting. Copy will be mailed upon request. Write to "Desk 6 Please."

35 pounds which, according to your letter, is what you seem to want.

This 45 pounds should produce ten gallons of ice cream if your overrun is 100 per cent.

* * *

Reply to C. B.: Your trouble is not what is regularly known as a sandy condition, but you rather have small ice crystals in your cream. This is undoubtedly due to the low total solids in your formula rather than any trouble in the freezing.

I imagine that your freezer if it goes 130 revolutions per minute is running just about right. You should freeze your cream to a nice smooth consistency, and it should not take longer than fifteen minutes to freeze a batch. If it takes longer you are not using enough salt with the ice. After you transfer the frozen cream from the freezer to the packers the ice cream should be hardened promptly and thoroughly and kept hard until it is sold by the dealer. It must not be allowed to soften up and then re-harden, as that will make it icy and coarse.

I am giving below the analysis of your mix, and I suggest in table 1 a new mix for you to try out. I suggest that you use a good grade of gelatine in place of the gum. The gelatine can be dissolved and rapidly stirred into your mix. The skim milk powder for extra solids can be mixed thoroughly with the sugar and gradually stirred into the mix.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
7.0 lbs. sugar.....	6.65
.25 lbs. (4 oz. gelatine)....21
2.0 lbs. skim milk powder....	1.9	1.90
22.0 lbs. 22% cream.....	4.84	1.53	6.37
18.75 lbs. 4% milk.....	.74	1.60	2.34

MAKING TRADE PAPER ADVERTISING

By Ezra W. Clark.*

Business and trade paper advertising is more rate than that in newspapers or magazines of circulation. It must be, as its readers are hard-clear-thinking business men. Exaggeration is crang in the hands of a copy-writer who goes for sales in the industrial field. Let a firm ad "\$5.00 helve hammers reduced to \$1.97 for quick ance," and the average production manager or engineer will question the quality of the hammer the integrity of the seller. Yet that is the substance the average department store advertisement.

Engineers are the most honest men in the world; they are honest not by choice, but by habit. They are accurate; these are the men you must reach; these are the men you must convince.

Factors that Count.

The trade paper goes to men—there is no waste of circulation. It is edited, however, not for men, but for engineers, executives, master mechanics, pure scientists, agents. The editors forget entirely that these are first-class men, with the wit of men, the natural imagination of men, passions of men, the needs of men, the imaginations of men. These factors are the background against which we project our advertising message. Disregard a single one of these factors in the editing section and you throw an added burden on the advertising message.

Lord Dunsany is an Irishman—the greatest man of his generation, if not indeed the greatest Irishman ever lived. Why? Because he was born into the world with a mission—"to keep alive the imagination of men." He is a builder of fables. He creates imaginary men and women and endows them with imaginary qualities—all to the end that his readers may be led to use their imaginations.

Imagination is the Father of Sales.

Imagination is the consort of advertising and the father of sales. We advertising men try to make our message intriguing so that our prospects will lay claim to them with virile imaginations. No sale in the business or industrial field is ever made until some man has created a mental picture of the lathe at work in the plant, of the locomotive on his rails, of the tool on the drill press, of the industrial truck hauling in his place of the buckwheat cakes steaming on his table, of the bacon frizzling on the hot dish before him. Before the purchase or the will to purchase, there must be a mental picture of the article installed and functioning for profit.

Hence our advertising will be sterile unless we impregnate it with the imagination of the prospect. Then its fecundity will be marvelous.

* Advertising Manager, Clark Tractor Co., Buchanan, Mich. Excerpt from a paper read before the Chicago Trade Press Association, March 28, 1923.

If you want a manager, superintendent, experimenter, chemist, bacteriologist, operator, pasteurizer manager, help of any kind, "The Ice Cream Review" can help you find the best available man. If you want a position, "The Ice Cream Review" can help you as it has helped hundreds of others to secure a good position.

Do you use 5000 or more ice cream cartons?

IF SO—you can save on the cost of your cartons, increase their advertising value, and insure perfect protection for your ice cream by ordering Character Cartons.

We don't intend to make a lot of claims concerning Character Cartons—but we do want you to see samples and get prices so that you may judge the superiority of Character Cartons both in *quality*, price and sales value. Convincing proof awaits every ice cream maker who writes us for estimates, enclosing his present carton, or for prices on a cleverly imprinted stock design for exclusive use in his territory.

The great volume and scientific arrangement of the Sutherland plant is the prime reason why even the smallest order can be handled at a price attractive to the user and still profitable for us. Sutherland Paper Co., Kalamazoo, Mich.

Preparation and Processing of the Ice Cream Mix

By Professor A. C. Baer, Stillwater, Oklahoma

(Continued from August issue)

IN thinking of something to tell you relative to the ice cream industry I suggested to your secretary to assign me a topic, and then I could talk on whatever I wanted to, and that is about what I will have to do. As most of you know, I have for ten years kept as close contact with the industry as perhaps any man in the world. I did it because I loved the industry and the progress the industry was making. No phase of the industry—dairy industry today—butter, cheese and so on, has made as rapid progress as the ice cream industry. There is no phase of the dairy industry, to my idea, that is so fascinating as the ice cream industry all over this country. I am in contact with this business all over the world. About a year ago we straightened out one or two ice cream factories in London; taught them how to make American ice cream instead of English cream ice. We straightened out a factory in Australia; taught them how to make real ice cream. One up in Alaska, another down in Cuba.

The movement for good ice cream isn't state-wide, it is not national, but it is all over the world. If I was to discuss the important needs of the ice cream industry today I would be at a loss to point out where something was really needed. In the matter of ice cream machinery, for instance, we think we have reached the zenith of progress today—such great steps have been made that I couldn't possibly think of a machine right

now that could be improved upon, yet again we find they are making improvements in our machinery year.

Great strides have been made in the advertising of ice cream. You ice cream makers know all about it because ice cream advertising companies are coming only after you to get your money to advertise ice cream and money spent for ice cream advertising is, I believe, the best money spent in an ice cream factory. I would, however, like to see the advertising end of it held off in another way—I mean I would like to see advertising end supplemented with a higher price than we have at the present, because we are, at present, advertising our own individual ice cream more than advertising a standard food product—university which, in my opinion, should be done. Part of the money for advertising should be spent just for advertising Texas ice cream, whether that ice cream is made in Fort Worth, or Dallas, or wherever made over the state of Texas, it should be the same good ice cream and if the people could depend upon it being standard and uniform in flavor, we would be spending our advertising money a little better.

Then we have the food value of ice cream. We cannot improve very much on what we already know of the food value of ice cream. We have our great specialists—like Doctor McCollum; all the high authorities tell us of its good food value. We have colleges, experiment stations, institutions; various educational bodies are helping through their dairy divisions to advertise ice cream as a food. We cannot however, get away from the fact that ice cream is eaten even today for its refreshing qualities than for its intrinsic food value; we know it is eaten as a confection as well as food. We must however, stress the intrinsic food value of ice cream if our business is to be permanent. Ice cream should have a place on the table regularly, in the home. Ice cream as a food is being placed regularly on our tables today more than ever before.

In looking over my correspondence work with ice cream factories—I counted up the letters the other day and found I had somewhere around four thousand inquiries that I personally answered. Somebody asked me this morning whether I ever answered inquiries outside of the state of Oklahoma. I have attempted to give advice which I thought might be of value to anybody in the United States. Recently a great many inquiries came from the state of Oregon. I don't know how it happened—whether my friend Olsen got to Oregon for a little while, but they found out I answered inquiries for ice cream factories. I am glad to do that, not because I am doing this for any particular glory, but because it helps me. I have learned a great deal from the ice cream factories of the United States. I began a rather heavy correspondence than any other I have given to them. We can only learn by direct contact with the industries. The ice cream industry is general all over the United States is trying to meet the same ideas relative to ice cream. I find that in every state in the Union; they are trying to make a standard product; they are paying more attention to the amount of butterfat, serum solids and total solids. They are putting in expensive equipment in all our plants and are employing competent men in the plants to

U. S. Heavy Duty Freezer

Marvelous Rapid Vertical Discharge

The U. S. Rapid Vertical Discharge ranks high as one of the many important special features in U. S. Heavy Duty Freezers. It makes marvelously quick emptying possible, thus speeding up production. It is so rapid, that it is easily possible to empty even a 160 Quart Capacity U. S. Heavy Duty Giant Freezer about as fast as an ordinary 40 Quart machine.

Insures Uniform Quality— Saves Time—Avoids Waste

Quick emptying of the freezer, once the drawing of the batch begins, also insures a uniform quality of product.

No matter whether the valve is opened wide or just a little, there is no wobbly stream, side ways squirting past the can, no loss of time watching the cream flow to make sure none is lost. Without doing any experimenting, the operator always knows just where to place his can on the floor below the machine, before he opens the valve, since the cream always drops right straight down in a continuous steady flow from the instant the valve is opened.

The U. S. Rapid Vertical Discharge

Showing the Rapid Vertical Discharge Gate Valve in operation in the Left, and Closed in the Right Side of the Picture.

Shows the New Open Head Construction, with one Hopper Cover Shown Open and the other Closed.

Working Advantages in Construction of the U. S. Rapid Vertical Discharge Gate

All metal ground in Sliding Gate Valve is cleaned. It is ground in to a water-tight fit, and automatically take care of all adjustment for and hold the gate fast against the guide faces. It allows the operator to observe the discharge from the gate.

this product standard from day to day. You will find this true all over the country. The small factories with a capacity of a hundred gallons or two hundred gallons, are spending more money to help standardize their product, compared to the total amount invested in their plants, than a lot of our large plants. They realize they must have a standard article, a wholesome article, an article which is uniformly good every day, uniform in composition, uniform in weight, so that the consumer will have confidence in their product. We vary in different states as to the amount of solids we use, as to the amount of butterfat, but we don't vary very much in the individual states in trying to keep up to a certain standard.

I am not intensely familiar with the industry here in Texas, but I do know we have in Texas some of the best and most modern ice cream factories that can be found anywhere in the country. I know some of the progressiveness of a number of factories in Texas. I do know that the Texas men are leaders in the ice cream business, and they are striving to get a real standard product for this state.

The subject which was put upon the program for me to discuss was, The Preparation and Processing of the Ice Cream Mix. There is possibly no other thing we do in our factory which is more important than to get our mix prepared right and treated correctly before freezing it and putting it out to the public.

This subject has been discussed a good deal, and if we were to analyze it we would say there were possibly three or four important factors connected with the preparation of the mix. The first one is good raw material. The next one is to have the mix carefully standardized—accurately standardized from day to day.

The third one is to have the mix processed correctly. And the fourth one, of course, frozen correctly. Of these factors are very simple, yet very complex. In looking about for raw material to make ice cream I would like to make the suggestion that there is better raw material to make ice cream with than cream and good milk. We have factories who are continually making ice cream from butter, powder, water, and who must depend upon those ingredients. Now with a good soluble powder and fresh butter, we can make a fine quality of ice cream; you cannot make it quite so good as if you used some fresh cream and milk. Just how to get the fresh cream supply and a fresh milk supply, of course, will have to be left to the individual factories. Raw materials for the manufacture of all dairy products is a primary consideration. You cannot make good butter from poor cream, and you cannot sell whole milk unless you have run a good milk supply, unless it is clean, unless it is well cared for. The same is true in regard to the ingredients for ice cream.

Now relative to the standardization of our product from day to day. I have taught for six or eight years short courses for ice cream makers. We are just finishing a short course this week. One of the things our boys must learn is how to accurately figure out butterfat, the solids, serum solids, and total solids. How to standardize a hundred pound mix. And of course, using the hundred pound basis to make any sort of a mix. That is not all, although they often have an idea that all there is in standardization is to just get it down on paper, and if your mix figures out eighty pounds of butterfat and you have a hundred pounds of mix, you know it has got to test ten per cent. If your mix figures out one hundred per cent serum solids you know that you have got ten per cent serum solids. That is not all there is in standardization because there is a chance for many errors. We have some factories that make up five and ten thousand pounds of mix—where there is a chance for many errors. Standardization means to accurately measure the mix and then standardize that which you have made, test it out. We have splendid equipment for doing that. The smaller plants can test for butterfat the Babcock test, and the larger plants can use the Mojonnier outfit. Thousands of dollars can be saved every year by accurate standardization in a plant. At the same time we will make a product which is standard.

Now coming to the processing of the mix. The word—"processing" has not been out very long, but it means the treatment the mix gets from the time it is made up until you get it to the freezer, and there is possibly the greatest difference we find in ice cream factories today—is the method of treating the mix. Before coming to that, however, I want to emphasize the necessity of careful work. First, you must have a good man or a good ice cream maker whose work is dependable, so that standardization is done accurately. Then he must have the right equipment to work with. If he hasn't got the equipment he can't standardize. He must be careful in his work. And then, he must have a laboratory to work with, it is a part of the equipment. When you have all of that equipment it is comparatively easy. In the standardization of your mix you can't depend on the ice cream maker altogether. If the ice cream maker makes the mix somebody ought to test it. Now, if we can afford to have a laboratory and a special laboratory man, why don't we check up the ice cream maker, and you will get accurate results. Now, in standardizing for a mix we ought

standardize not only for butterfat and total solids, but also try to get out mix standardized for milk serum solids or total milk solids. As far back as six years ago I began to preach to you the use of extra milk solids rather than butterfat. The contention at that time used to be that ice cream should contain a lot of butterfat—fourteen per cent used to be the idea. I had that idea once upon a time myself. Then the question of reducing the butterfat was considered. If we are going to cut down on the butterfat why not increase the serum solids so that the total milk solids will be the same? To give you an illustration: If you make fourteen per cent butterfat ice cream, and then use sugar, and milk, and cream, you are going to have a little better than twenty per cent milk solids—total milk solids. Then the question was, suppose you reduce the butterfat to twelve per cent without adding any additional milk solids you won't have twenty per cent total; and if you reduced it to ten per cent in order to make twenty per cent milk solids you would have to have ten per cent milk serum solids, and that amounts to four per cent extra milk serum solids in your ice cream mix. Now, there is every reason today why we should continue to put this extra milk solids in. Right now in studying the market we find in regard to milk powder, for instance—there is hardly any milk powder on the market. Condensed milk is possibly a little short. But as a rule we have enormous quantities of skimmed milk that used to be wasted for human food and which can be diverted to the ice cream industry and put into the ice cream, and it will make a very fine food.

I was greatly pleased when in Oklahoma we passed an ice cream law which made it obligatory upon ice cream factories when they put in ten per cent of but-

terfat that they had to increase the milk solids to make legal ice cream. About two years ago, got a similar law requiring 10 per cent butterfat and 20 per cent total milk solids. I am convinced a much better cream than we formerly had was put in fourteen per cent fat and no extra milk solids, and then, we didn't figure the food value of cream. We actually made the ice cream better by reducing the butterfat content and putting other solids into it.

Down here in Texas you have eight per cent butterfat standard. Now, if you ice cream makers make a product and use eight per cent butterfat and put in any additional milk solids, you are going to have your total solids pretty low. I know most of the ice cream factories in south Texas put extra solids in the ice cream, because it pays to do it, they get a much more solid body in the cream, and are able to get a higher overrun; putting extra solids into the mix they will get a better quality of ice cream. We are doing it in order to comply with the law—that you don't have to do, but to come back to that a little later.

I would like to discuss with you, since I heard yesterday you are contemplating some legislation, in regard to the ice cream law, and give you an idea what the ice cream law in Texas ought to be. Now if you are going to make eight per cent ice cream in order to have twenty per cent milk solids you have to use twenty per cent serum solids—that is six per cent over what you would have if you didn't use any extra solids; but twenty per cent serum solids is pretty high, and some of you are going to have some sandy ice cream if you are going to use twelve per cent milk solids, especially if the milk solids are furnished from certain products. This makes this sandy condition more liable than others when you come to eight per cent fat standard. If you put in twenty per cent total milk solids, it is a pretty good standard to follow. I will talk a little more about this a little later on.

In the preparation of ice cream mix the use of things besides milk products and sugar becomes necessary. We thought long ago that gelatine or something else similar must be used in commercial ice cream; I have thought so continuously for a number of years, although I hesitated at first to make myself clear in the matter, but in the last few years I am absolutely convinced there is no better stabilizer in ice cream than good straight gelatine, and I am afraid to say so because I know I am correct. I have no objection to the use of gum or commercial stabilizers we are using, because they are all right in the mix. I have no objection to the limited use of these things, but when it comes to a real stabilizer—considering all points of view, we have so far not arrived at anything that will equal a good grade of gelatine; and I would recommend to our commercial trade the use of gelatine or something else for it.

Now we have some differences in the way of using this gelatine, and how to use it. I have for a number of years recommended the use of gelatine in the mix directly into the mix rather than cooking the mix previously in a boiler. We know that our standard is absolutely correct in that respect. The action of gelatine on the water we have in our mix causes the formation of little globules; the water crystallizes all the sharp crystals. The little gelatine globules and the particles of water make it impossible for the crystals to become apparent. If you add water to gelatine, you have got to add a larger amount of gelatine. We have the practice of adding hot gelatine to

NATIONAL MANUFACTURING COMPANY
1006 W. Slauson Avenue, Los Angeles, Cal.

“—the only really successful brick cutting machine”

mix—some of you still do it—is absolutely wrong. Why we will continue to do that I don't know. Just the minute a little hot gelatine strikes a cold mix it congeals, while if you would have that gelatine mixed in a comparatively warm temperature and then pass it through your homogenizer it will be in proper shape. I am not going to enter into this discussion any further. Professor Burke, who is with me in the dairy work in Oklahoma has analyzed over eight hundred different lots of gelatine, not only for its strength, for its purity as a stabilizer in ice cream, but also for fat. That information isn't ready, and I will not attempt to give you some of those results; we will give them out a little later; possibly a year from now we will be ready to give them out, and we will have something worth while.

Now the first thing in the making of ice cream mix or in the process of ice cream mix is thorough pasteurization. Pasteurization does not mean heating ice cream mix at 120 and then run it through the homogenizer, but pasteurization means to heat it to at least 145 degrees, and hold that temperature from twenty to thirty minutes. I need not talk to you about pasteurization and why we should pasteurize—I was a little discouraged yesterday when the talk was made by your health department man and when he stated that you back-watered two years ago on the law that you were trying to get through the legislature—allowing ice cream factories that make only twenty-five gallons of ice cream a day to be exempt from pasteurization. (Applause.) My advice would be that you go to the legislature this winter and tell them that you want one hundred per cent pasteurization law or you don't want any at all, because the little fellow, the twenty-five gallon man is the one who ought to pasteurize. You big

ice cream factories do pasteurize anyway; it's the other fellow you want to get. There is no more dangerous product made over this state than the product made by just these little fellows that the health department man tried to defend; if he was here today I would be glad to give him all the argument I can in this respect. We tried that up in Kansas. The health department man there said, "What are we going to do with these little fellows?" he said, "These fellows make such nice delicious ice cream." I asked that man who was sitting right across the table from where we were, if he had ever been on the inside of one of these places where they made this nice sweet ice cream, and he admitted he had seen one or two, and he also admitted they were not very desirable institutions.

The Kansas people finally got a law and they made it one hundred per cent. A man that cannot pasteurize dairy products—I don't care whether it is butter, milk, or ice cream, ought not to be in the dairy business for the purpose of furnishing supplies to the consuming public; that is all there is to pasteurization; there is no argument against pasteurization, every argument for it. I am so thoroughly convinced of this matter that I have made a thorough study of it for the last fifteen years. There has not been a drop of milk in my family table; there has not been a speck of cream or butter on my table, or ice cream, unless I knew it was thoroughly pasteurized. I would consider myself criminally negligent if I allowed my three or four year old child to have any kind of dairy product unless it was thoroughly pasteurized. I want to get into your minds that if you come to fight for a pasteurization law in Texas, you must include in that law the manufacturer of ice creamery butter—you can't touch the farm products, you cannot include in that law the small milk; but you can at least go this far, that any milk which is bought by a dealer and resold by him, must be pasteurized. It is pretty hard to require pasteurization where a man runs a dairy farm and bottles his milk at the farm and sells it in town.

Another thing that was brought out by your health department man yesterday was, that these little factories that make only twenty-five gallons a day ought to be thoroughly inspected to be sure that everything is clean before they are permitted to make ice cream. You could not enforce any law, and the legislature would not afford the money to inspect those fellows one day in two years; you can't do it. Gentlemen, you, as an ice cream industry ought to see that you get the right legislation. I like particularly well the attitude of your health department man; I like he is open and frank; I like his attitude of co-operation with you as ice cream manufacturers for you to suggest what you want, and this, that is the other, and that he would give you the proper support and co-operation and assist you in putting it across. We have got to do it. Now, if I were to give this talk to an audience of women, or consumers of milk and dairy products I wouldn't dare to make my argument quite so strong, so that they wouldn't feel that the product was something obnoxious to eat. We can go before the public and advertise milk, and cream, butter and all of these other dairy products as good food when we, who are in the game, know that these things are produced under circumstances which make them liable to contamination; we also know that the product is handled by human beings; that human beings are apt to have disease germs, are apt to be those that milk the cows, that their separators are not clean; but we do know there is one safeguard which will insure good pure dairy products—I mean all milk, cream, ice cream, butter, and so on—the

TEXAS ICE CREAM MANUFACTURERS' CONVENTION.

(Continued from page 36)

make all of them safe as an article of food by pasteurization. So let's go with this pasteurization down to the limit and not stand for any compromise. You ice cream manufacturers—the ice cream men of this state—the milk men of this state don't take any compromise like was mentioned here today. I certainly hope you won't do it.

In order to get the confidence of the people in a product like ice cream we must convince the public consuming public that we have a real article and, and they must have confidence in us—they always have it in your ice cream, I can assure you.

You will find club women in a town, and especially private families in town, they will go to an ice cream parlor and eat all the ice cream that they can get, and then on Sunday morning they will make their own home ice cream for Sunday dinner. If they could feel that the ice cream they bought down town was good ice cream they wouldn't make their own ice cream. I saw an illustration of that not very long ago. The governor of Oklahoma and two or three very prominent men in Oklahoma were over at the college creamery, and as usual we gave the visitors the ice cream to eat. Mrs. Robertson said, "Isn't this ice cream delicious ice cream. Isn't it funny we can't get that kind of ice cream in Oklahoma City where we live. We have just got to make our own ice cream in order to get good ice cream." Now she thought, of this particular ice cream was made better. It seemed to be real good, but it wasn't any better, possibly not as good as she could buy in Oklahoma City, she just had that idea. I tried to convince her then and there that she had made a mistake—I said it wasn't a hundred per cent true—but I told her she could buy ice cream anywhere in Oklahoma just as good as that ice cream she had at the college—that the ice cream factories of Oklahoma were all making a standard product; that they were careful in the selection of their raw material; that they all pasteurized their products thoroughly and made it safe to use; and she could, without any doubt, buy ice cream anywhere in Oklahoma City—from any factory, or anywhere else in Oklahoma, and that she need not be afraid it would not be good. Now, I said I really didn't make it a hundred per cent—I made it a hundred per cent; we do have, I am sorry to say, still factories in Oklahoma that are not coming up to that hundred per cent standard. Now that is what we have got to fight.

Ice cream is an American national dish, not only for pleasure, but a national dish to be eaten as such and we have got to convince the American people, people of Texas, and Oklahoma, and Kansas, wherever they are, that it is ice cream, and if it is ice cream it is a standard food product regardless of whether it is made in Mississippi, or Texas, or Oklahoma, or wherever it may be made, and we must get the consuming public to realize that, and if we do that we will double the consumption of ice cream. We are just beginning the ice cream business today, in ten years from now the public knows what it will be.

We have got to convince the public we have got a good product. What does the public expect of a food product? There are a number of things I would like to mention. First of all, a food product in order to be a national food product must be nutritious; that is a simple fact. Second, it must be balanced. Third, it must be palatable, people must like it. Fourth, it must be a safe food product; they must be able to eat it without getting sick from it. And the fifth requisite,

The Manning is, first of all, a can washer of durability. A great many Manning users have written us that this machine has given unequalled service for as long as eight years.

What other can washer will give service like this at so small a first cost?

Manning Manufacturing Company

Rutland Vermont
U. S. A.

*The Washer that Grips
The Can!*

JUDGE NOT LEST YE BE JUDGED—CUT NOT LEST SOMEONE ELSE CUTS, TOO.

it must be comparatively cheap in order to be a food product.

We think ice cream is a very nutritious food product. You have a very much better balanced food in ice cream than you have in anything else we eat. If we eat a dish of lettuce, or a beefsteak, we have not got a balanced ration; but if we eat some potatoes, and all of those separate foods combined into a meal, we have a balanced ration; but you have in ice cream a balanced food without anything else. If you have a balanced dinner and end up with a balanced dessert, ice cream will not over-balance your dinner because it is already balanced. That is especially more true of your eight per cent butterfat ice cream in Texas than it is in fourteen per cent ice cream in some other state. Fourteen per cent is over-balanced in butterfat. We know ice cream is palatable, and we must convince the public that ice cream is safe. Everyone knows that on every Fourth of July picnic that someone—somebody gets sick and goes to a doctor, and the first thing the doctor says, "How much ice cream did you eat?" And he tells him how much he ate. "Well, that is what make you sick; better not eat any more ice cream."

I had a case come to my personal observation. I found out that the man got sick from eating ice cream, but he ate twenty-two dishes of ice cream that day, and the ice cream tested twenty per cent butterfat; it is no wonder he got sick. We have the so-called cases of poisoning come up every once in a while. The first thing they think of is, ice cream did the poisoning. There are fewer cases of poisoning that can be attributed to ice cream than any other food product under the sun—you can make up your mind to that if they are actually traced out.

We think ice cream is comparatively cheap. It is hard to convince people that ice cream at fifty cents a quart is cheap. It is hard to convince people that at ten cents a quart is cheap, they think they ought to buy it for six cents, because it is such a common article of food. Milk is the cheapest thing they buy. Ice cream, of course, is not the cheapest thing we eat for the amount of nutrition, but one of the cheapest things we can buy because of its one hundred per cent digestibility. We cannot compare a pound of ice cream and a pound of meat, because your meat is an indigestible piece of goods, it is not such hard work to eat that piece of steak as to digest that piece of steak. With ice cream the butterfat in ice cream is the only thing that is working on by the digestive organs of our body to get it in soluble form to go into the blood, the rest already is in a soluble form.

Nearly every factory is equipped with an homogenizer, or viscolizer, or emulser, and that is today the process that in ice cream cannot very well be left out. We can still make ice cream by putting milk and cream into a vat, and pasteurizing it, and then cool it down and freeze it, but we can't manufacture large quantities of ice cream in that way without some sort of processing. The small factories can afford an emulser. There is so much trouble that occurs trying to do without this process that you pay for the machine many times, sometimes in a single season. In the spring of the year when you have a lot of fresh cows from which you derive your milk and cream, if you are not very careful you will have greasy ice cream, and people do not want grease for ice cream, and you can't get away from that condition unless you process your mix through anyone of those machines. The homogenizer and viscolizer for the large factories, and the emulser for the small factories; they have done more to keep the quality of ice cream uniform from day to day than possible with any other machines we have. It is my opinion that they are not only a necessary adjunct to processing the ice cream mix but that they are indispensable in an ice cream factory. I don't need to hesitate in saying that, for I am not going to sell any homogenizers or viscolizers by saying it; they are so universally on the market today that we know we can't get along without them.

Now, the temperature at which to run the mix through the homogenizer, viscolizer and emulser will vary. If you have followed up the discussions—answers to a lot of inquiries on that subject you have undoubtedly noticed that the temperature run on a homogenizer varies from 120 to 190. Some of them will pasteurize, they say so at least—pasteurize at 120, hold it thirty minutes and then cool it down to 110, and then run it through the homogenizer. On viscolization

LIKE the Proverbial Acorn, The Olsen Publishing Company has grown to a mighty oak, spreading its many branches of service to all ends of the dairy world.

Its publications, The Milk Dealer, The Ice Cream Review and the Butter, Cheese & Egg Journal have long ago been recognized as leaders in their respective fields. They have maintained their prestige only on account of the service rendered to the dairy industries.

And with the sturdy growth of this business of Service to the Dairy Industries, a mighty printing plant has been developed.

The advertising and printing needs of the dairy industries is a specialized line to which our organization has devoted its entire energies. Profit by commanding our experiences. No obligation to you to submit your advertising and printing requirements for comment and quotation.

The Olsen Publishing Company
5th and Cherry Streets Milwaukee, Wis.

I think the directions that go with the machine says, to bring it down to 120, if I remember right, before processing. Now, it is a technical point, a scientific point, that the hotter you put it through the homogenizer the better will be the effect. It has to be, because the liquid is thinner when it goes through a higher temperature, and it is better processed in going through the machine. I haven't had enough practical experience with the viscolizer, I have with the homogenizer—to know whether or not 120 is right or not. If I was running a machine in a factory I wouldn't start cooling but I would start it through the homogenizer or viscolizer—it is possible that the viscolizer wouldn't work at a temperature of 145 or 150, but I think the homogenizer will work at that, but that is left to your discretion. You may get good results through the homogenizer at 110, and the next man may run it through the homogenizer at 140 or 145 and get good results. I would try it out in the winter months when you can practice on your machines and actually find out. I could not tell you off-handed, but if I stayed in your factory for ten days and watched everything carefully, and put on a pair of overalls and work like I have done many times, I could find out just exactly what was right.

Now, after your mix goes through the homogenizer and after it has cooled down, the question that seems to be bothering ice cream factories still is: What temperature to hold this mix before you freeze it, and, of course, the length of time you ought to hold it. Some factories will freeze within six or twelve hours after processing. Some will say they never freeze until 48 hours. Usually the majority of the factories freeze within twenty-four hours. Now, what temperature must you hold or should you hold it? That differs in the

opinion of ice cream factories today. Many of our cream factories, lots of them have the idea that when you process your mix you have got to ripen it. I have asked a great many questions about ripening ice cream. They say you have got to hold the mix at a temperature of, say 60 for so many hours, or 70, and then cool it down in order to develop enough acidity—enough in the mix so it will ripen. Five years ago I was absolutely sure that you did not have to develop any acidity in ice cream mix to get the overrun. You need acidity in ice cream mix to get the overrun. There is every reason why you should not ripen ice cream or develop any acidity; every reason why you should not do it. Still only last winter a factory in Oklahoma brought some ice cream to me, and they said, "The way we ripen it, we throw a can of butter milk into the vat just about four or five hours before freezing, and it will ripen it." Another man said, "The way I usually do it, I just leave a little mix in the vat, and then put the mix back in the old vat, and then start putting in the new mix, and in that way acidity develops." Three years ago I came in contact with the Ward Ice Cream factory at Fort Smith, and in talking with them I found that they never developed, or tried to develop any acidity in ice cream.

I went a little further this year—we had a student, a graduate from the A. & M. College, who is employed at the Ward plant at Fort Smith, and another student at Okmulgee, Oklahoma; so I told these two boys, "I want you during the months of June, July and August to test the acidity of every ice cream mix immediately after cooling—after homogenizing and cooling, and to test it immediately before freezing." I know that both of these plants have an overrun tester now. I told the boys to ascertain the overrun, along with the acidity test. Both of these factories were not trying to develop acidity, they were trying to keep the mix just as pure and sweet as possible all the time—until it was frozen. They have absolutely no difficulty in averaging a hundred per cent overrun on the mix, and that is the overrun we need to get in order to maintain a weight.

That just reminds me of a statement made yesterday that you were going to incorporate in your law that ice cream should not weigh less than twenty pounds, or four pounds to the gallon. If you do that you are going to have some poor ice cream. Twenty pounds of a half gallon is too light in weight if you are going to make a weight standard. My suggestion would be to leave the weight out of the law entirely, because it is very hard to regulate the weight of ice cream, but if you are going to do that make it 22½ or 22 pounds for a five gallon can, and that will still enable you to make

MEMBER—YOU ARE JUST AS MUCH A MEMBER OF THE ASSOCIATION NOW AS YOU WERE LAST WINTER.

one hundred per cent overrun. In Kansas they made a mistake, and they had to make a little concession like your health officer said you had to make two years ago, in order to get the bill through, they made the concession to the health department and put the weight at four and three-fourths pounds to the gallon. I think you could have enough argument to convince them that you didn't need any weight in the law.

Now, relative to the holding of the mix. If you hold the mix below fifty degrees you will get very little increase in bacteria—if you hold it forty-eight hours. Most of us will try to hold it a little lower, between 35 and 45, is about the limit. If you hold it below 35 you are holding it too cool to get any effect; if you hold it over 45 you are liable to go 65 if you don't watch it very closely; so I would say an average of 40 degrees will be about the right temperature to hold the mix. Now, as to the time to hold it; 48 hours will be the proper time to hold the mix for maximum good results. A mix held 48 hours will give you a better body and smoother texture, and will give you a better effect than all the improvers you could use in the world; better effect on the quality of the ice cream. "Aging" is the word you want to use; don't use the word "ripening." If you still have to ripen the mix, if you think that is the best, put in an acidity test and you will find you will get less overrun if you are ripening the mix than if you did not ripen it.

Relative to the bacteria count, discussion has already been had with reference to milk bacteria count. The bacteria count in ice cream is an important factor. I believe in San Antonio, or Fort Worth, or somewhere, one of your cities in Texas, they have a bacteria count in ice cream.

Mr. Ross: Beaumont.

TAG HOOKS Save Dollars

Why use expensive, untidy, time-losing strings or wires while tagging your tubs or pails of ice cream?

SNAP 'EM ON

and use our rust-proof tag hooks.

SAVE TIME—Figure the cost of strings or wires. Then think of the value of a man's time while tying the tags on your tubs.

CAN'T RUST

Our new type of hooks are made of SPECIAL SPRING BRASS. They sell at \$1.95 per hundred, including staples. Besides a 10 per cent discount in lots of a thousand or more. Samples on request.

DALY BROS.
SCHENECTADY N. Y.

Professor Baer: Beaumont, Texas, I guess that is right. I know they have milk bacteria counts in every city in the United States; they have what they call a bacteria standard. A bacteria count should be placed upon ice cream. I want you to follow, if you haven't followed it—if you didn't follow the discussion relative to bacteria found in ice cream—the discussion in the last two or three issues of The Ice Cream Review. I would suggest that you follow that out. There is going to be, I imagine, some more discussion. The discussion as to bacteria in ice cream started when the National Dairy Science Association in Minneapolis, this fall, were going to adopt a score card for scoring ice cream. I personally had a score card, including a bacteria count for ice cream. They were ready to adopt the score card in Minneapolis. I was a member of the Committee on Ice Cream Score Cards. Of course, I was interested in getting my score card adopted—and one might think it was due to a little selfish motive, it wasn't because of that, however, but it was because I believed that the score card which I did present was the score card that should and will be finally adopted. All the analysis for bacteria ever made for ice cream in Washington by the health department of the city showed that the bacterial content of ice cream is somewhere from ten million to six hundred and fifty billion per cubic centimeter. Now, all of those figures—I don't care how many books you read—all of those figures bearing on bacteria in ice cream are so far out of date that the books ought to be thrown away; they were all made from raw cream mix; they were all made under conditions which do not pertain today to any modern ice cream factory. When I proposed a score card which would allow a perfect score for twenty thousand bacteria per gram I felt I didn't allow enough. I was willing to allow twenty thousand for a perfect score per gram. I placed five hundred thousand as the limit on the other side, and if it was over five thousand I would mark "O" on bacteria. Then the question came up how many points on the score card should we allow for bacteria. I put twenty points down, or one-fifth of the total value of ice cream for bacteria; one-fifth or twenty points for food value; and forty per cent for its flavor. The question, arose regarding the twenty points on the score card for bacteria.

I am thoroughly convinced, and I can prove it from A to Z that the bacteria count in ice cream is absolutely just as important, if not more important than the bacteria contents in milk that the gentleman talked about a little while ago. The bacteria count is one way for the health department to determine that the ice cream is in a sanitary condition. If we have got an ice cream factory that is going to ripen the mix, it is going to be careless about the cleanliness of the vats they use, and what is the use of pasteurizing if you are going to re-inoculate it with bacteria? So when we begin to thoroughly pasteurize ice cream, then is when you get a good bacteria count, because if you thoroughly pasteurize ice cream you get less bacteria in your frozen ice cream than you do before you put in through the pasteurizer. If you had a count of five thousand and immediately after pasteurizing it is cooled, you ought to have less than five thousand when you put it in the freezer, because keeping it at a temperature of 40 degrees isn't going to increase your bacteria count, it is actually going to decrease it due to certain bacteria which are going to become inactive with that low temperature. In an ice cream scoring contest up in Kansas a few years ago we scored twenty-eight lots of ice cream, and out of those twenty-eight, twelve had bacteria counts below twenty thousand.

Summing Up the Ice Cream Business

By F. W. HOLMES, Manteno, Ill.*

THE Good Book tells us, "Be not slothful in business," and that means, defined, be diligent, be intelligent, and as our Jewish friends would say, "Be careful, count your costs."

Had that been observed during the year 1921 there wouldn't have been 19,000 business failures in the United States of America.

Again we are told, "Whatsoever your hand findeth to do, do it with all your might," and that implies do it right. That brings us to this thought. I wonder if as ice cream manufacturers, we have had the vision to look into the future, and plan wisely and well; whether our plant is great or small. For this reason, we cannot tell when the unforeseen may happen, and your small or great factory may be shorn of its glory and its earning power. I am sure we have need to be very considerate, to try and plan as near as we can on the 100 per cent basis, so that by study, association, and research, we can arrange our factories and our equipment, that the time may come—when, perhaps, your prosperous business of the last few years may have a change, and the remnant might have to go into other channels.

Now for instance, we analyze, just as I said, on the percentage basis. We are going to take the manager, and consider him first of all. Call him the Boss, the manager, or the proprietor. I wonder if he is a man of administrative affairs. I wonder if he is giving his

time on the whole and is using the means at hand watching from the front row, or pew, of what is going on in his plant. Perhaps he is attending a conventional sectional meeting and getting into other factories, where the doors are always open, as have always been open to me. He may be conferring with other men, and seeing what they are doing, but this good-enough spirit in these days will not do. We must have the very best. I believe if that manager will, perhaps, do some of the things I have said, he will be entitled to the forty per cent allotted to him and will be sold to a better ice cream business.

Now this allotment may not work in your factory, it may not work in any of our factories, but it will do for an analysis.

The next man is the ice cream maker. He is a man of the hour in the plant. He is a big factor in the production end; he must have confidence in the management, as well as confidence in himself. He must be a willing worker, a man that is willing to assume responsibility; and must be a student of his department, whether he uses, in his mixes, milk, cream, condensed milk, powder, butter, specialized air, or what-not.

He must know things of the machinery, emulser, the viscolizer, or the homogenizer, he must not guess at them, because he is to produce a product that must be absolutely right. A good product is going to mean much toward the success of that plant, while a poor product will put the concern on the blink in no time.

About the yield—he must know a few things too, or the boss's cargo may not come into port with any profit. Perhaps he is entitled to more than twenty per cent, you measure it for yourself. If he is not equal to the above per cent and then some, he is not sold to better ice cream business.

The next lieutenant is the salesman. Of those that have had the privilege, and most of us I think have had some experience along the selling line, know that he must be a man of tact, good humor, efficiency, and a judge of human nature. He must have something to sell, and be a close chum of the ice cream maker, that he may have a larger field to draw his knowledge from. He must absolutely believe in the product he sells, whether it be Morris's of New Haven, Carver's of Los Angeles, or Cunningham's of Chicago. His slogan might be, "Our Ice Cream for Quality, Service, and Merit and Value." It is one thing to produce a product, or a commodity, it is another thing to market it. Seventy-five per cent might be allotted to the "Know how," and twenty-five per cent to the "I will," and the two make a good combination for the salesman.

His slogan may be the same as that of Mr. Sam Nivling, of Rochester, N. Y., in his address last year. He said, "Don't go chasing all over hell's half acre for a few stray gallons at the expense of, somebody else, and not do you very much good. But rather cultivate trade closely, and carefully, within a proper radius of your own plant, and you or that salesman will be sold to better ice cream business.

The next man in line as a lieutenant is the collector. This man may be a twin brother of the salesman, or, perhaps the same man as the ice cream salesman. It depends upon the size of the plant, if he is he is entitled to the ten per cent allotted to him. As I see it he is an important spoke in the wheel, he is almost a whole wheel in himself, for he is the man that is going to put joy into the heart of the financial department

You Must Make Better Water-Ices

IN actual test, the first row of water-ices shows a color ranging from a pink-white of the first dish to an intense red of the last. But in the second row, every water-ice shows a true raspberry shade, a delight to the eye and a temptation to the palate.

Textor

A blend of vegetable gums, a pure white powder, transparent, colorless, odorless and tasteless when dissolved. Requires no heating, soaking or boiling. Textor binds together the ingredients of an ordinary water-ice into one smooth, firm, perfect blend that will not disintegrate. Textor makes water-ices as dependable as ice-cream.

The difference is due to the stabilizer, Textor, which holds the color of the second row of water-ices evenly distributed. Textor gives the water-ice the ability to retain its delightful flavor after any number of repackings. The water-ice in which Textor has not been used will be icy and tasteless or of a syrupy consistency. Textor keeps uniform the color, the flavor and also the texture of water-ice.

Textor Makes Better Water-Ices

Simply by the addition of Textor to the mix, the flavorless, colorless and rough water-ice becomes smooth, with tempting color, and of delightful flavor. Textor prevents separation, producing a water-ice absolutely free from ice crystals. Textor makes your water-ice as dependable as ice cream and develops a big new market which increases your profits substantially.

Test Textor Today

Let us send you a 60-pound drum of Textor with instructions and recipes. 10 pounds of it will stabilize 350 gallons of water-ices or sherbets. Try Textor and notice the improvement in your water-ices and sherbets.

S. GUMPERT & CO.

Bush Terminal

Brooklyn, New York

when he comes in with the dough, or vice versa, a gloom when he comes in without the money.

Again I say this man doesn't want to have a faint heart, he must be a stickler. If he isn't his goose will soon be cooked. It often is no snap to handle the collection department and one will almost need grace from on high, at times, to meet the situation. I would say stick to your weekly terms, where credit is extended, as near as possible. The dealers get the cash in most cases, and when a bill has to be deferred try to get a short dating ahead. Put it down, then you have the customers own word for it. Follow it up, and be there on the job, on time, because if the customer cannot pay a reasonably sized bill how is he going to pay a big one? This continually deferring a past due bill is soon going to spoil a customer, and he will think you are an easy man, and you may lose your money in the end. Oftentimes you make a better, and surely a safer, customer to put him on a cash basis. If possible don't go away without leaving your customer in good humor, but your money you must have or how can the bills be met for raw material, light, power, heat and a multiplied number of other things that come so fast sometimes they almost get our goat.

If this lieutenant can, and will, do the above, he has done much toward making his work worth more than the ten per cent allotted to him, and he is surely sold to better ice cream business.

The next man is off in the corner. We don't very often go around and see him, not as often as we ought to. He is only allotted five per cent. I am afraid I have listed him too low. He sure holds an important job. A good can washer is like the safety valve, or blow off, on the boiler.

The 5c Eskimo Pie Now a Money-Making Sensation

Gigantic Summer Demand Paving the Way for a Huge Gallonage Output

The Eskimo Pie Cutting and Dipping Machine

Makes it possible to manufacture the 5c pie at a net cost of 20c a dozen, including license, wrappers, labor and material.

Not only reduces labor cost to less than 1c a dozen but eliminates all loss of chocolate and cream. All pies are exact in size and shape—no small wasted ends. By using our formula we guarantee a better coating obtained at a cost not to exceed 5c per doz.

Complete machine including motor and electrically heated tanks, ready to run.....\$375.00

THE NORTHWESTERN CORPORATION, Morris, Ill.
MANUFACTURERS

Suppose we step into his office some well steamed and heated July morning, when he has cans to the right and cans to the left, and the east is west and the west is east, for he is sure to have plenty. First of all, he must have the necessary room, the needed machinery and equipment to take care of what he should. A good word or an occasional call from the head of the department keeps him from getting careless. A careful can washer, with plenty of well sterilized cans on hand, tried for leaks, on the racks, is a value. If this man in his department is a worker then he is, I believe, worth more than the five per cent, and is sold to better ice cream business.

Lastly there is another man, entitled, the machinery superintendent. He is that fellow in the plant that if he does his work right, he is here and there, all over. You hardly know where to locate him. He may be looking after weak belts, or a motor that may not sound just right, a pump, steam or electric, that needs attention. And if he is on to his job he sees that all bearings have the proper oiling in due time. Perhaps tightening a bolt, or some part that may be working loose or getting out of place. His work is a work of prevention rather than one of cure. But he also must be a doctor, if the case needs be, that he may repair a break, and do it quickly, or have it done.

Do you think this man by being just a little careless could tie up the whole work in many plants? Then, this machine superintendent, while attending strictly to business, is worth more than the five per cent allotted to him, and is sold to better ice cream business.

Now then, gentlemen, the summing up of the different lieutenants, the manager forty per cent, ice cream maker twenty per cent, salesman twenty per cent, collector ten per cent, can washer five per cent, and the machinery superintendent five per cent equals one hundred per cent. One hundred per cent is efficiency, and when that plus sign is completed, you have a number one bookkeeper and auditing department.

Gentlemen, I haven't told you anything new, it is just the old, old story, perhaps, with a few sidelights, and I believe that if we will observe some of these things that I have said they may help us to better ice cream business. Just one word more and then I will be out of your way.

When we are in business we are likened unto a ship that is out at sea. No mariner, sea captain, sailor or ship owner ever feels just quite right until they have landed their cargo safely in the port. Stop! Look! and Listen! How is your year end cargo coming into port? Are there any leaks in her old hull? Are there any damaged goods on board?

Look carefully and examine her before you come in. I thank you. (Applause.)

The Feminine Slant

By FANNIE KILBOURNE*

THE letter was well typed, crisply phrased, businesslike, impersonal—all but the postscript:

"* * * and the contract is thoroughly satisfactory. I shall arrive Friday the eighth, and if convenient should like to confer with you Saturday. I shall then be ready to go to work in earnest Monday morning.

"Thanking you for your courtesy and promptness, I am—

Sincerely yours,
S. A. MEADE.

"P. S.—It is only fair to tell you that I am a woman. If you don't want me on that account, please wire me right away.

Yours truly,
SUSAN ALICE MEADE."

"Well, I'll be hanged!" Miles Willard, president of the Maple Leaf Ice Cream Co., looked over at Dan Mahoney, manager of the Maple Leaf plant. "Would you ever have thought that the young Chicago fellow who wrote those, 'Don't keep a race horse on a pack mule's job' ads, and the, 'Well, why not smoke tobacco for a change?' was a Susan Alice?"

"Susan Alice!" Dan turned to regard his employer with open-mouthed amazement. "I'd 'a' bet a dollar his first name was Sam. And we've hired a Susan Alice for an advertising man! Susan Alice!" He sat for some moments stunned to silence. "Well, I'll bet you two bits," he finally offered, "that she's more Susan

* In The Milwaukee Journal, The Love Story of a Business Girl—Romance with Pep.

than Alice. I had an old maid Aunt Susan once." This last feelingly.

When Miss Meade arrived at the one-storied brick Maple Leaf plant on Saturday, however, she proved her right to both her names. She was Susan in the slim straightness of her dark suit, the smart plainness of her hat (which had doubtless cost five times as much as a mere man would have guessed), in the businesslike directness of her approach.

But under the smart plain hat her hair was soft and wavy; and under her businesslike phrases her voice trembled a little. Excitement sent a sudden hot, unbusinesslike wave of color sweeping down to the severe plainness of her collar. Oh, Susan had done her clever professional best, but, in spite of her efforts, something still remained unquenchably Alice.

It was Susan who assured Mr. Mahoney, impersonally, pleasantly, that anywhere he could find room for a desk for her was quite satisfactory. It was Susan, also, who listened with alert, intelligent respect to Miles Willard while he explained that the Maple Leaf Co. was an infant concern, that the ice cream could not be placed on the market for two months yet, although, of course, the advertising was to be begun at once, that the huge Wiley Ice Cream Co. would be their only competitor, and that, beyond her year's contract, he could promise her nothing; her future would depend upon the future of Maple Leaf Ice Cream.

It was Alice who fell in love with Miles Willard while he was still explaining the state ice cream laws, long before he had reached the requirements as to the percentage of butterfat. She would not have admitted this to herself, of course.

"The Wiley plant is just over the state line," Willard said, "and the law there lets them get away with only 5 per cent. Then they run their 5 per cent ice cream in here and sell it, through any manufacturer in this state has to have 8 per cent. We're going to have 10 or 12. I've had the thing looked up to the last fraction of a cent, and we can afford to do it and still sell at the same price as Wiley's. They must be making tremendous profits."

"Quality will have to be the advertising angle," decided Susan.

"I wonder if he's married," thought Alice.

But Miss Susan Meade, starting work next Monday morning, was as pleasantly crisp and businesslike as the white linen collar and cuffs on her well-tailored tricot dress. Dan Mahoney, whose desk in the large, bare office room was only 6 feet from hers, liked her at once and chuckled when he saw how she put the new Maple Leaf Salesman—a fresh young man with a vaudeville quotation wit—in his proper niche.

But when Donaldson, this same salesman, suggested to Willard that the brick ice cream be made not in the customary layers but with a maple leaf of the contrasting flavor running through the brick and showing on each slice, Susan was his most enthusiastic supporter.

"If the molds don't make the process too expensive," she urged, "it would be wonderful advertising. Think of it, your trade-mark on every piece that is served!"

The idea became a Maple Leaf Co. fact.

Susan selected the design to be used for the counter advertisements, chose the lettering for the street signs, wrote the copy for the advertisements which began appearing in the newspapers.

"It's like the orchestra playing before the curtain

Nafis Automatic Acidity Test

For Testing the Acidity of Ice Cream

BARBER

Everything for the Dairy Industry

Let Us Help You to Work Out Your Pump Requirements

When you buy Barber-Goodhue pumps you get more than just pumps—you get the expert service of an organization that for many years has studied the pump requirements of the dairy industry and has met them successfully.

The adaptability of the pump *to your particular work* is fully as important as its mechanical construction—and it is the business of our engineers to help you locate the right pump. You can't buy the wrong pump, or one that is impractical or costly in its operation, if you will advise us fully concerning the work you want it to do.

We have a tremendous stock of pumps and parts always on hand, ready for immediate shipment—no delays, no expensive shut-downs for repairs.

Before you buy, put your pumping requirements up to us, writing us fully about the conditions to be met. Where necessary supply a rough sketch.

We have a complete pump catalog which we shall be glad to send on request.

Simplex Model B Belt Drive Pump
—capacities from 4,000 to
40,000 pounds per hour.

goes up, isn't it?" she observed to Willard. "We've got to get the audience all excited about Maple Leaf ice cream before it comes on the stage at all."

Occasionally, Susan and the president were left alone in the bare office. The stenographer was still needed only mornings, and Dan, of course, spent a good deal of time in the plant proper, overseeing the placing of the freezers, inspecting each new arrival of containers. Donaldson was out most of the time, and the bookkeeper, whose work was still light, went home of an afternoon.

It was on these occasions that Susan had the hardest time keeping Alice properly subdued, for the conversation strayed a little into more personal lines.

"My capital," he told her confidentially, one afternoon, "comes from my uncle. He's a husky fellow of 50, and he said to me one day, 'If you want to take your share of my money right now and lose it in some business, go to it.' So I may be doing it," Willard grinningly admitted.

"No, you aren't going to lose it," Susan Alice insisted. "You've gone into the business too thoroughly before starting out."

"I've gone into it thoroughly enough," the man admitted. "I worked with the Wiley Co. for three years, learned the business from every side. They never had one bit of real competition in the city at all. And the Wileys don't make good ice cream. The first time I tasted their stuff I knew there was a market for some good brand. I used to drive the truck around some of those hot days and try to figure out how I could get hold of money enough to try it, and when I was in a new town, I'd know all about the ice cream company that covered the place, even if I didn't see the town hall."

And on another day, when a chill spring rain beat against the window panes and Willard set the little electric stove to glowing cheerily in the gray office, the conversation began with advertising. The president looking over some of Susan Alice's new copy.

"A woman of the world is always an epicure," he read. "Her table bears witness to the more delicate discrimination which comes with wide social experience and poise; her cook must understand the piquancies of coriander, chervil, rose geranium leaves; her steaks must be broiled over live coals, her salads dressed with

imported oils, her ices rich in quality, exquisite in flavor."

"The only sign of an advertisement," Susan Alice explained, "will be below, in very dignified type—'Maple Leaf Creams, Ices, Parfaits, Mousses, May be Ordered Through Your Caterer or Direct from Us. Telephone West 4287.' That won't appear until the cream is really on the market," the girl explained.

"Yes, but isn't this appealing to a pretty limited class? We can't stick to the families that have cooks and caterers, you know, and make any money out of the ice cream."

Susan laughed.

"Of course not! This isn't aimed at the women who keep cooks, but at the women who hope to some time—and that's pretty nearly all women. 'A woman of the world'—every woman likes to think she's that."

Willard's face lighted in understanding.

"You're really appealing to her vanity, then."

"Of course! She may not know coriander from cornucopia, and her husband may like his steak fried—but she's going to get the impression that Maple Leaf ice cream is pretty classy."

Willard read the copy through again, carefully slowly.

"What's chervil?" he asked at last. "Blessed if I ever tasted of it."

Susan Alice's gray eyes twinkled.

"It's a seasoning," she explained. The twinkle deepened. "Blessed if I ever tasted it, either."

"Of course,"—she turned earnest again—"I'm not keeping to that kind of advertisement alone. Here's one I'm going to run in The Sunday Journal. They are going to have nearly a page on the pure food commission, and this will be on that page. It's headed, 'Are You a Real Judge of Food?'"

"It goes on:

"Can you tell by the taste of ice cream, for instance, whether the sweetness is sugar or glucose? Can you estimate fairly accurately the percentage of real cream used? Can you be sure whether the flavoring is made from fresh fruits or from some chemical imitation?"

"If you are a real connoisseur, you will appreciate

the new Maple Leaf ice cream. If you are not, its trademark is your protection."

Willard nodded in approval.

"Sounds good to me," he admitted.

As Susan replaced the top sheets on her pile of manuscript he watched her curiously.

"How did you happen to take up advertising?" he asked.

"I started out by furnishing 'the feminine slant,'" she said. "I had a suitor who was an advertising man, and he was always asking my opinion on this or that. He said that women bought nine-tenths of everything sold, either directly or indirectly, and so he wanted to get the feminine slant on all his advertising."

"So you decided," Willard concluded, "to be the feminine slant instead of just furnishing it."

Susan nodded. "He was really a very smart man; yet I realized how little he understood of how a woman's mind worked. And I got to thinking that a woman writing advertising would have a tremendous advantage in that sort of work. So I decided to try it."

She went on with a half-timid eagerness:

"I'm sure that more women than men decide what kind of ice cream is bought—even if a man is taking a girl into a drug store for a sundae, he takes her to whichever drug store she likes best. And the man druggist or confectioner is influenced by that."

There was a little silence then in the office. Then Willard asked:

"And what happened to the suitor? Is he still suiting?"

"Oh, no. I trust he suits his wife now—he's been married these many moons."

After another silence, Willard and Susan went back to pure business.

"We ought to have a good chance on Maple Leaf," he observed. "If you can create a market, I know I can deliver the goods. We'll have both the masculine and feminine slants on this deal—that ought to make a good combination."

"Oh, it surely does!" said Susan, "My, if we can just put it over!"

"We've got to!" Willard repeated.

There is no knowing just how much of the future of the company was really decided that rainy afternoon. For without this afternoon, and a few others like it, Susan Alice might not have felt quite so intensely as she did when Frederick Ledder's offer came.

Susan met Ledder at the quarterly luncheon of the Advertising club. It was a sunny April day. Susan wore her new smart sand-colored suit, her new hat—very tiny and covered with violets. Her hair where it showed under her hat was soft and black; her gray eyes were faintly purpled by the violets above them.

Carlyle, the advertising manager, introduced Ledder.

"This is your bloody rival, Miss Meade; Mr. Ledder is advertising manager for Wiley's ice cream."

"A rival?"

He was a big, imposing-looking man with an assured, imposing manner. He drew back Alice's chair, then seated himself beside her, and commanded with a geniality that was half flattering, half amused condescension: "Now tell me all about it."

Susan Alice smiled up at him under her violet hat with a decided dash of cool assurance.

"Indeed, I shan't tell you all," she said. "I'm not at all sure that I shall tell you anything."

This was not the reply Ledder expected. He was a powerful man—Wiley's brother-in-law—he was a tremendously sought-after bachelor, and he was rich by his own efforts while he was still young.

And when, after stopping to speak to the club president, who had paused behind his chair, he turned back to Susan Alice, he was met by the curve of her slim sand-colored shoulder, the three-quarter back of her little violet hat. She was talking to Carlyle, on her other side. Ledder leaned across and tapped Carlyle on the shoulder.

"Now, look here, son," he observed with jovial insolence, "you just pay attention to your soup like a good little man. I'm going to talk to Miss Meade."

Ledder, as a big advertiser, was in a position to speak this way to Carlyle, and he knew it. But he had reckoned without Susan.

"Oh, no, you're not," she said good naturedly, "—not till Mr. Carlyle and I have finished off this burning subject." She glanced down at the steaming cup before Ledder. "You have some soup of your own," she reminded him.

By that time Susan Alice turned back to Ledder, their relationship had been definitely established. He was the one who was being favored; so long as he interested her and amused her, he would be permitted to talk to her. After that—pouff! And partly because Susan was young and pretty, but even more because the situation was so piquantly unusual, Ledder accepted it, even felt actually flattered when Susan allowed him to drive her back to the Maple Leaf plant in his low-slung, foreign built roadster. He asked with what was really humility for Frederick Ledder:

"And when do I see you again?"

"At the next Advertising club luncheon, if you go. Mr. Carlyle has asked me."

"Good heavens, that's three months away!"

"Three months," said Susan, "is a very short time when you're busy."

and Virginia Boost Cleveland Week

NEW YORK, N. Y.—“The display made by the supply men
was not only a most interesting one, but in many instances
very helpful in the practical running of our business.”

C. E. Kilburn Speaks

This is the opinion of C. E. Kilburn, president of the Kirk-
Maher Company, Malone, N. Y., which has branch offices in
Plattsburg, Watertown and Massena, N. Y., and affiliated compa-
nies in Utica, Oneonta and Binghamton, N. Y., and Montreal,
Canada, of the National Exposition held in Cleveland in 1922,
which is to be repeated on a
greater scale October 22nd to
27th, inclusive, 1923.

Letter in Full

Writing to The Association of
Ice Cream Supply Men recently,
Mr. Kilburn said:

“Last fall at the National
Exposition of your Associa-
tion at Cleveland, we had
six men from our concern,
and we considered that it
was money and time exceed-
ingly well spent. The dis-
play made by the supply men
was not only a most inter-
esting one but in many in-
stances very helpful in the
practical running of our
business. In fact, we have
never allowed our buyer to
miss one of your exposi-
tions.

“There are probably many
companies who have not
taken advantage of the op-
portunity which you offer
them in seeking this exposi-
tion, but if they would once
attend and look at things
intelligently, I believe that
they would not only save
more money than their trip
would cost them, but in
many cases save a great deal
more. It is certainly the
most efficient way of keep-
ing abreast of the new de-
velopments in the ice cream
business and we heartily

recommend it to every ice
cream concern in the coun-
try.

Very truly yours,

KIRK-MAHER COMPANY,
(Signed) C. E. KILBURN,
President.”

Sacks Makes Comment

George P. Sacks, vice-presi-
dent of the Chapin-Sacks Cor-
poration, Washington, D. C.,
has expressed his personal and
business belief in the value to
the industry of the Second Na-
tional Exposition, also.

(Continued to Col. 1, Page 4)

He Has His Room Already

C. J. Alfred, president of the
California and Southwestern
States Ice Cream Manufacturers'
Association and of the Alfred
Pure Ice Cream Company, Inc.,
Los Angeles, Cal., recently wrote
to The Association of Ice Cream
Supply Men, “I did not attend the
convention last year but received
so many glowing reports of the
benefits received from ice cream
manufacturers that when it was
my privilege to vote for Cleveland
I immediately engaged rooms for
Mrs. Alfred and myself one day
ahead of the convention date, as I
do not propose to be hurried and
will take plenty of time to see
what the supply men have to
offer.”

4,000 REGISTRATION EXPECTED

Advance Interest Unprecedented,
Say Clevelanders

CLEVELAND, OHIO — Reports
received here by the Convention
Board of the Chamber of Com-
merce of Cleveland, show an
unprecedented advance interest
in the Second National Exposi-
tion of the ice cream industry
to occur October 22nd to 27th,
inclusive.

4,000 Registrants

Present reports to the Board
from The Association of Ice
Cream Supply Men of a tre-
mendous interest already evi-
denced in every state in the
country in the forthcoming joint
Convention-and-Exposition in-
dicate, it is said here, an almost
unparalleled enthusiasm so
many months in advance.

It is now common talk here
that Cleveland is to experience
an ingress of 4,000 representa-
tives of the ice cream industry
next October.

Reflects Sentiment

With such expressions of
commendation of the joint Con-
vention-and-Exposition as are
reaching The Association of Ice
Cream Supply Men from rep-
resentative ice cream manufac-
turers in every section of the
country and which, it is be-
lieved, reflect the general feel-
ing of the industry, it is felt
certain here that at least that
number from the four quarters
of the continent will register at
the greatest ice cream show in
history.

Exposition Extra

Published for the promotion of the Second NATIONAL EXPOSITION for the ice cream industry to be held in Cleveland, Ohio, October 22nd to 27th, inclusive, 1923, by THE ASSOCIATION OF ICE CREAM SUPPLY MEN, 1328 Broadway, New York, N. Y., an organization of supply houses located from coast to coast, the salesmen of which houses enter every county in the United States and Canada, and all of which member houses and their sales representatives are bound by a Fair Practices Code to deal honestly with buyers. They are known by

THE SEAL

OF SAFETY

TERMS: Have your name correct on the mailing list.

FROM EVERY STATE

Ice cream manufacturers registered at the Exposition in Cleveland last year from 42 states and 4 Canadian provinces.

Ice cream manufacturers in nine states, in this number of the EXPOSITION EXTRA, voice their intention of registering at the greater Exposition to be held in Cleveland this year and indicate their valuation of its service to them as individual manufacturers and to the industry as a whole.

In the last EXPOSITION EXTRA still other ice cream manufacturers in Canada, in North Carolina, in New York, in Michigan, were quoted to the same effect.

It is more than ever apparent, although the Exposition is nearly three months in the future, that it is to be the industry's own great climax of interest and self-expression in 1923.

HOTELS—NOW!

Although it may seem a far cry today, from summer weather and peak production to autumnal October and the Convention-Exposition in Cleveland, it is not a far cry when it comes to hotels.

Cleveland hotel reservation books are filling up rapidly for the week of October 22nd. Make your reservations now!

HOTELS KEEP EXPOSITION RATES DOWN; RESERVATIONS, MONTHS AHEAD, MOUNT UP

Cleveland's Modern Hotels Have Already Allotted Hundreds of Rooms for October—Reservations Should Be Made Now

Cleveland, Ohio—The leading hotels are reporting banner advance room reservations for October.

The hotels Cleveland, Winton, Hollenden and Statler all have booked reservations for the majority of their best rooms for the week of October 22nd to 27th, inclusive, when the joint convention-and-exposition of the National Association of Ice Cream Manufacturers and The Association of Ice Cream Supply Men will be held here.

Cleveland Hotel

The Cleveland Hotel, which is situated on a corner of the Public Square, is to be the official headquarters of the National Association of Ice Cream Manufacturers. It is one block, diagonally, from the Cleveland Chamber of Commerce building in the Auditorium of which, a room seating more than 1,000 persons and with exceptional acoustic properties, will be held

Supply Men's Hotel

The Winton Hotel, which is to be the headquarters of The Association of Ice Cream Supply Men, is at Prospect and East 9th Streets, about a seven-minute walk from the Public Hall. The list of supply companies which already have made reservations at the Winton Hotel for the Exposition reads like a roster of the country's important supply houses. The rates at the Winton Hotel are: Single rooms, \$3 to \$5; double, \$5 to

tional Association of Ice Cream Manufacturers during the Statler's 1922 convention. Rates at the Hollenden Hotel are: Single rooms, \$3.50 to \$6; double rooms, \$6 and \$7; twin-bedrooms, \$7 to \$12; all rooms with baths.

The Statler

The Statler Hotel, one of the nationally known hotels owned and managed by E. M. Statler, is a five- or six-minute walk from either the Public Hall or the Chamber of Commerce Auditorium. It also is well known to many ice cream manufacturers. Rates at the Statler Hotel are: Single rooms, \$3 to \$6; double rooms, \$6 to \$8; twin-bedrooms, \$5.50 to \$8; all rooms with baths.

No Rate Raises

Cleveland hotels, unlike those in many of the country's large cities, are definitely bound by mutual understanding and pledges given to important organizations not to increase their regular transient rates for convention delegates.

The same rates that prevail throughout the season as

In the official headquarters of the National Association of Ice Cream Manufacturers—a part of the main dining room and a section of the main lobby of the Cleveland Hotel.

the sessions of the National Association of Ice Cream Manufacturers on Monday, Tuesday, Wednesday and Thursday, October 22nd to 25th.

Range of Rates

The Public Hall, Cleveland's new \$6,000,000 municipal building, is just two blocks further distant from the Cleveland Hotel, the Chamber of Commerce Auditorium being on the way. Rates at the Cleveland Hotel are: Single rooms, \$3 to \$8; double rooms, \$5 to \$10; twin-bedrooms, \$7 to \$10; all rooms with baths.

\$8; twin-bedrooms, \$7 to \$10; all rooms with baths.

The Hollenden

The Hollenden Hotel, one block distant from the Public Square, is not more than a minute's walk further from the Chamber of Commerce Auditorium than is the Cleveland Hotel, and it is slightly nearer the Public Hall in which will be held the Exposition.

The Hollenden Hotel has been famous nationally for years and is the favorite Cleveland stopping place of many ice cream men. It was the official headquarters of the Na-

whole are being made to delegates to the National Association of Ice Cream Manufacturers' Convention, to all other ice cream manufacturers who visit Cleveland to inspect the exposition and attend the convention sessions and to all representatives of supply houses.

4,000 Guests

Cleveland hotel men are counting on 4,000 visitors during Ice Cream Week. Naturally, the ice cream manufacturers who make their reservations first are obtaining the first choice of rooms.

Army of Four Thousand to Descend on Cleveland Will Weary Batteries of Hotel Clerks, Spread Desolation Among Poultry and Keep 167 Pullman Cars, a Train Yard and 200 Waiters Busy

Cream Invasion Would Swamp Largest Hotel in the World and Make the Man Who Invented Ice Cream Stagger

CLEVELAND, OHIO — They're coming. They're coming. The ice cream army. Four and strong!

There are very few interests in this country, professional, business or fraternal that could stand an army of 4,000 persons in a given city at a given

Literal Count

The ice cream army of 4,000 persons would advance on Cleveland in the month of October 22nd for the joint Convention and Exposition of the National Association of Ice Cream Manu-

facturers. The printing would float the *Leviathan*, the British navy and make the Woolworth Building a fishing bobber.

Poor Hotel Clerks

In much the same strain, but with a literal regard for truth in its comparisons, the ice cream industry might best conceive of its importance by visualizing its army of 4,000 that will advance on Cleveland in October in the act, for instance, of registering at a hotel.

Experienced hotel men say that if there were anywhere, to begin with, a hotel with facili-

ties of a single hotel building that could house the ice cream army that will march on Cleveland will be the result.

It would take a train of 167 Pullman cars to transport the

army in the last twelve months would be necessary. It would take all of an extensive railroad yard to hold such a train when it stopped.

To transport 4,000 persons would require more than three times the Pullmans in this picture.

10,000 chickens or 6,000 pounds of beef would be the chefs' quota for one meal.

and The Association of Ice Cream Supply Men is an organization with no mythical count, connected with the ice cream industry knows well.

Many is 4,000?

Up in a row against one another are the Allies that in the war it might look like a scouting party, it is but it will look like no kirmish line when it descends on Cleveland in Octo-

ber. It is a magazine published occasionally to the world that its issues if stacked end to end would reach from here to the back, or some such measurable, mad distance, and the ink used in their

ties available for 4,000 persons and if every room in that hotel were ready for occupancy, and if everyone registering knew in advance what sort of a room he wanted and at what rate so that no delay in discussing various rooms occurred, it still would take three expert hotel clerks ten consecutive hours, working every moment, properly to register an army of 4,000 guests.

No One Hotel

But that is assuming an ideal condition that does not exist. To begin with, there is no hotel in this country that could receive an invading army of 4,000. Think of the largest hotel you have ever seen and then imagine its capacity about doubled and the mental construc-

tion of a single hotel building that could house the ice cream army to Cleveland. To pull that train a large part of the new locomotives bought by the railroads in the country

The Army's Food

How much food would the ice cream army of 4,000 eat
(Continued to Col. 1, Page 4)

There are 2,200 rooms in the Pennsylvania Hotel, one of the world's largest. It could not house the 4,000.

MANUFACTURERS FROM COUNTRY OVER ENDORSE GREATEST CONVENTION-SHOW

Value to the Industry and to Single Businesses Receives Repeated
Emphasis by Executives

(Continued from Col. 3, Page 1)

He recently expressed himself as follows:

"Unquestionably, conventions are educational in themselves and it is unquestionable, too, generally speaking, that the progressive and successful man can, to a large extent, attribute such progress and success to the enlightenment received by rubbing elbows with his fellow-man which conventions certainly afford.

"Should nothing unforeseen occur, it shall be my pleasure to attend the 1923 convention, and it will also be my pleasure to prevail upon many who have heretofore been absent to give serious consideration to the importance of being present."

From Indiana

C. W. Field, secretary of the ice cream manufacturers' division of the Indiana Manufacturers of Dairy Products, and one of the principals of the Ballard Ice Cream Company, Indianapolis, is on record with "Yes, I am in favor of it."

"I want to say that I think it is of the utmost value to ice cream manufacturers in general," was Mr. Field's further recent comment on the great Exposition which is to fill 60,000 square feet of area with displays. "It is possible to see there the latest things in use and all under one roof."

Best Opportunity

"At no time since ice cream became a commercial proposition has the ice cream manufacturer been offered a better opportunity to see and learn more of his industry than by attending the 1923 meeting," N. D. Brookshire, of the Brookshire Ice Cream Company, Meridian, Miss., and secretary of the Mississippi Ice Cream Manufacturers' Association believes. He recently told The Association of Ice Cream Supply Men, in addition, that "There can be no question as to the benefits derived by the ice cream manufacturer attending the convention of the National Association of Ice Cream Manufacturers and the National Exposition of The Association of Ice

Cream Supply Men to be held in Cleveland October 22nd to 27th, inclusive. A number have mentioned the fact that the 1922 convention of manufacturers and exposition of supply men held in Cleveland was the biggest thing ever pulled off since the organization of these two bodies. From advance reports 1923 is to be even better."

Striking Approval

Many other ice cream manufacturers representative of the industry as a whole have expressed themselves in the last few weeks as enthusiastically looking forward to the Cleveland week. Some of their comments follow:

"I attended the convention last year. It was a wonderful convention and a wonderful exposition. The only complaint that I have to make is that the convention and entertainment took up so much of my time that I did not complete my inspection of the exposition."—L. W. Wilson, Benham Ice Cream Company, Fresno, Cal.

"It is a great opportunity for ice cream manufacturers to view the most up-to-date and modern machinery that the industry affords, and gives the manufacturer who contemplates purchasing additional equipment an excellent opportunity to view the merits of all machinery."—C. S. Hutchinson, president of the Associa-

tion of Ice Cream Manufacturers of Iowa, Hutchison's Purity Ice Cream Company, Des Moines, Iowa.

Real Knowledge Gained

"We operate seven distinct departments in connection with this establishment and a great deal of knowledge is obtained both in the way of manufacturing, the handling and sales of ice cream by attending the Exposition."—F. E. Rudhma, O. P. Baur Confectionery Company, Denver, Colo.

"A display of equipment and supplies used in the industry would be of very great interest to those attending the session and from my personal viewpoint I would think it a very excellent arrangement."—W. Roszell, president of the Illinois Association of Ice Cream Manufacturers, Roszell's, Peoria, Ill.

Advantageous Arrangement

"I think it very advantageous that the supply men and ice cream manufacturers hold their meeting in the same city and at the same time, for it is only these meetings that we are to come in personal contact with each other, which I believe leads to better acquaintance and appears to be the most reciprocal arrangement that could be made for this purpose."—I. H. Fill, president of the Virginia Ice Cream Manufacturers' Association, Chipin-Sacks Corporation, Richmond, Va.

4,000 Army Will March In October

Startling Figures of Invasion

(Continued from Col. 4, Page 3)

during its week in Cleveland?

The most imaginative purveyors of foods refuse to give an estimate. They say it is like attempting to visualize what a billion dollars is—the mere volume becomes unimaginable.

To serve this army of 4,000 with one meal—assuming that there were a dining hall and

adequate kitchens anywhere for the feeding at one time of so many persons—would require 200 waiters.

Some Sad Statistics

If capons comprised a course at such a single dinner 1,100 of them of 6 pounds each would have to be prepared and cooked and served.

Or 2,000 whole chickens.

Or 6,000 pounds of beef.

Or all the lettuce, for a salad for instance, that a lettuce bed as large as several city blocks produces.

The industry that can recruit an Exposition army such as that is truly what its representatives are saying of ice cream—"A National Industry!"

IN connection with manufacturers' annual conventions, the NATIONAL EXPOSITIONS for ice cream are the industry's own self-interpreting!

The Acidity Problem in the Ice Cream Industry

By BENJAMIN I. MASUROVSKY*

WHENEVER a dairy product is undergoing processing, the problem of acidity becomes of paramount importance. The first thing the creamerymen are trying to control is the percentage of acidity in the raw material and its modification later on as occasion might demand. In the case of buttermaking, for example, the acidity of cream is controlled as to kind and quantity. The acidity which has developed in the cream on its own accord is neutralized with an alkali (lime). The micro-organisms which produce the acidity are then destroyed by pasteurization and, finally, a desirable culture of bacterial flora is inoculated and kept under favorable conditions until the required acidity of the raw material has been reached. The control of acidity in cheesemaking is of a different type. Here an optimum acidity is necessary to allow the rennin to do its work to insure a good quality curd. In some cheese factories the acidity is produced by the use of small quantities of mineral acids, such as hydrochloric acid, in other cases the acidity of the milk is brought about by allowing the lactic acid bacteria do this work.

Is it necessary to consider acidity in the case of ice cream making?

The purpose of ripening cream in buttermaking is fundamentally that of giving the butter a desirable flavor and aroma, but in addition it increases the ease and efficiency of churning.

The purpose of controlling the acidity in cheesemak-

* Graduate Assistant, Dairy Dept., University of Nebraska, Lincoln, Neb. Written especially for The Ice Cream Review.

ing is to facilitate the work of the rennet extract to coagulate the casein and form a firm curd before the whey reaches a certain point of acidity which might be detrimental to the cheese curd once it is formed.

The main purpose of controlling acidity of the ice cream mix is to avoid the lactic acid flavor which stays with the frozen ice cream. Many ice cream makers, however, are under the impression that by raising the acidity of an ice cream mix within safe limits might make it possible to reduce the time during aging and bring about a desired viscosity for proper ice cream making.

A careful ice cream manufacturer can see at once that the problem of acidity in ice cream making is a far more delicate one than in the case of buttermaking and cheesemaking. Why? Because, in the first place, the flavor of ice cream is a more delicate one than that of butter or cheese, and, secondly, because the consumer pays more attention to the flavor of a relish, such as ice cream, than he does to the flavor of butter or cheese.

In the light of these two points regarding the acidity phase of ice cream making several series of experiments have been carried out at this department with a view of pointing out the necessity of controlling acidity in proper ice cream manufacturing.

The series of experiments were grouped as follows: Group I, in which the mix was aged from 2 to 3 hours. Group II, in which the mix was aged from 19 to 48 hours. Group III, in which the mix was aged for 72 hours.

Each group included two or more batches, one always serving as a control which would enable to check up and compare results obtained from the acidified batch. For the purpose of raising the acidity in the experimental batches of ice cream an addition of starter, prepared from commercial butter culture, was used in amounts sufficient to bring about the desired acidity. The acidity ranging as follows: from .12, .13, .24, .26, .29, .35, to .37 per cent acid expressed in terms of lactic acid. In all cases the stock mix was composed of sweet cream, skim milk fresh from the separator, powder skim milk, granulated sugar, and gelatine. An example of one of the experimental stock batches is given below:

60.5 lbs. of sweet cream testing 45% butterfat.
78.5 lbs. of separator skim milk.
2.25 lbs. of powdered skim milk.
28.0 lbs. of granulated sugar.
1.0 lbs. of gelatine.

170.75 lbs. of stock batch testing 16 per cent butterfat and 40.11 per cent total solids.

The powdered skim milk was dissolved in the sweet skim milk and added to the sweet cream in a pasteurizing vat (50 gallon capacity "Wizard"). The vat content was raised to a temperature of about 120 degrees F. at which point the mixture of the dry gelatine powder and granulated sugar was added to complete the stock batch requirements. The entire mix was then pasteurized at 145 degrees F. for 30 minutes and ran through a homogenizer at a pressure between 2,000 and 2,500 pounds per square inch and cooled to about 45 degrees F.

To every 73 pounds of stock batch 12 pounds of either pasteurized sweet skim milk or skim milk starter was added, immediately after homogenization, thoroughly mixed in ten-gallon cans and set in the aging room, where it was kept at a temperature between 40-45 degrees F. The test of the experimental mixes were

Every year since the introduction of Gaulin Homogenizers the yearly sales have shown a substantial gain. This season however has shown a larger gain than in any previous season which is substantial proof of the ever increasing popularity of Gaulin products. The Gaulin is built to endure. Every detail of construction is carefully worked out, not alone to make a pleasing appearance, but with the primary object of building into the finished machine the utmost of durability. The result has been an Homogenizer pleasing in appearance, beautiful in its smooth, silent operation, and brutish in its rugged durability.

There is a place for a Gaulin in your plant whether you make ice cream, chocolated milk drinks, cottage cheese, Jewish sour cream or any one of a dozen different dairy products. May we not advise you?

as follows: 13.5-14.5 per cent butterfat, about 14 per cent sugar, 0.5 per cent gelatine milk solids-not-fat 7.8 per cent, making a total solid of about 36 per cent.

In all cases care was taken to keep the acidified mixes and checks under the same conditions to insure a fair comparison of results.

In one case only caramel flavoring was used while the rest of the batches contained 4 ounces of vanilla for every 10 gallons of frozen ice cream. The lactic acid flavor and taste was easily detected in the experimental batches acidified with the lactic starter. Especially was

it pronounced shortly after "pooling" the ice cream from the freezer while on standing in the hardening room part of the lactic acid flavor diminished but persisting in quantities objectionable for the ice cream trade.

Examining the table it will be noticed that the acidified mix tends to increase in viscosity. However, the overrun of each acidified batch compared with that of the control were almost the same in every case.

In conclusion it might be of importance to point out that since the introduction of acidity, in the form of lactic acid starter, imparts objectionable flavor in many ice creams and does not noticeably influence the efficiency of making ice cream, it would not be good practice to use dairy products of high acidity in ice cream making, so far as practicability is concerned. The safest way is the use of sweet cream or other raw material available for ice cream making avoiding acidity above 0.2 per cent expressed as lactic acid.

Do not forget that ice cream still is a delicate dish in the human diet. Furthermore, ice cream is the flower of the dairy products.

Let us keep it sweet, fragrant, and delicious.

MUCH ICE CREAM EATEN IN MICHIGAN.

A special report of the bureau of dairying of the Michigan State Department of Agriculture shows that Michigan consumed 722,322 more gallons of ice cream during the year ending July 1, 1923, than it did during the previous year. Retail dealers average 40 dishes to the gallon, thereby serving 28,892,880 additional dishes of ice cream during the year. The dishes this ice cream is served in are three inches in diameter and placed edge to edge would form an unbroken path from Lansing, Mich., to Jacksonville, Fla., with a few miles of full dishes left over for refreshment at the end of the trip. The actual consumption of ice cream for the year was 9,205,265 gallons.

Brick ice cream, which was first sold in 1919, is rapidly gaining popularity in Michigan, 15 per cent of the state's ice cream now being sold in that form. The brick packages have been found to be more sanitary. There is less waste to the dealers and the package makes possible more than one flavor. The bricks are cut and packed in the factory by machinery eliminating unnecessary handling.

Michigan requires a 10 per cent butterfat for ice cream; the majority of other states have a slightly smaller requirement and some higher. Samples of ice cream secured by inspectors of the bureau of dairying show that the actual butterfat content is considerably above the law requirement.

The increase in business last year was more noticeable in the southern counties of the state, although consumption for the state as a whole is much greater than in states south of Michigan, according to statistics.

MARYLAND ICE CREAM CO. RE-ORGANIZED.

Re-organization of the Maryland Ice Cream Company, Baltimore, Md., by issuing \$100,000 preferred stock and \$100,000 common stock, was announced recently. Of the preferred stock \$97,700 has been sold, and \$49,900 worth of the common stock has been disposed of.

The directors of the company are: President, J. C. Leib; vice-president, R. N. Stevens; secretary-treasurer, L. W. Davis, and W. B. Townsend and W. E. Nickerson.

An advertisement placed in "The Review" Want Department will put you in touch with just the kind of help you are looking for. Give "The Review" a trial—it's the best way to get results.

Under What Conditions Do Out-of-Town Packing Routes Pay?

By P. P. MILLER*

PROBABLY one of the main factors in bringing about the rather chaotic conditions now existing in the ice cream industry has been the use, or I might call it the misuse, of the interurban packing route. Invented by the life aggressive manufacturer as a means of securing that additional gallonage so much sought after by each and every one of us, it has been taken up by a majority of the manufacturing group as one of the most effective cudgels ever placed in the hands of competition and with what results?

Just this: trucks have been pushed out into so-called new territory without any thought as to the effect. The result has been that our competitor was stimulated to like action and both lost money.

We have taken a few gallons away from Brown by running a packing truck into his territory and a few gallons from Smith by the same means, and they in turn have clipped our wings in a few places by the same method, and where is the ultimate gain to be figured? Can the majority of you manufacturers say that you have opened up new fields of ice cream consumers? Can you say that you have actually increased your gallonage, or if you have been so fortunate to secure that increase, has it been worth the price you have paid?

Right here I believe we come to the first element essential to a successful packing route, namely, **Good judgment.** Present conditions are evidence of the fact, that we have failed in many cases to use any of the gray matter with which we are all endowed. Our packing routes cover this great state like a spider's web and we are bucking each other at every turn in the road.

It is often said that competition is the life of business and such undoubtedly is the truth, but, gentlemen, in our particularly industry, a continuance of certain forms of competition is going to mean death to some organizations. As a whole, we have followed the other fellow too closely and when he put in a packing route, we did the same, because everybody was doing it.

* With Kirk-Waher Co., Watertown, in address before N. Y. State Convention, December, 1922.

Steam Jacketed Copper Kettles

Whatever your requirements may be in steam jacketed Copper kettles, we are in a position to supply you. Ideal for every kind of mixing, melting, boiling and cooking requirements.

Fifty-two years of specialized experience in manufacturing kettles for the trade assures you of the maximum of satisfaction in design, materials, and workmanship.

Let us figure with you; let us help solve your kettle problems.

Hamilton Copper & Brass Works Co.
HAMILTON :: :: :: OHIO

I do believe the interurban packing route can be made to be a paying proposition under certain conditions which I shall enumerate later, but I do think too many of us are continuing these routes merely to "keep up with the Jones," and in the face of facts which show plainly that we are losing money on them. Suppose Brown starts a route upon which he believes he can make money and because my customers on the territory covered by that route tell me that, unless I give them the same service they will buy Brown's ice cream, I too place a packing truck on the same route. Brown is in a better position to take care of that route than I am and I find that it does not pay.

What is the thing for me to do? Discontinue the practice which I know is losing money for me and resort to other more profitable means of meeting the competition. I know many of you are saying to yourselves "that sounds good, but it isn't practicable." Gentlemen, I know it sounds good and the only reason it is not practicable is, because the majority of us lack the courage to give it a trial. We talk this question over at our conventions, but do we do enough about it after we get home? The remedy lies in getting together in our own localities and putting on our thinking caps, taking heed of the dictates of our own good judgment along with that of our fellow manufacturer and meeting the problem in a business-like manner.

Location of Towns.

Probably the second point essential to a successful interurban packing route is the location of the towns which are to be served. In many parts of our states we find groups of towns which are pretty closely linked together and in these localities an interurban packing route ought to be fairly successful.

Also in some places we may find a town, which is large enough to maintain a sufficient number of dealers to pay us to run a truck there and give the same service as is given in the city. However, there are certain sections in which neither of the above conditions are to be found and still you will see packing trucks running about the country, over dirt roads to small settlements hardly large enough to support one dealer.

The delivery costs on such routes can not help but be far in excess of what good business sense tells us they ought to be, and therefore, they are a menace to our industry. Unless your plant is located in a thickly populated part of the country, or you have access to a large town containing numerous dealers, you had better stop your packing routes before they stop you.

The climatic conditions in the various territories should be taken into consideration, when planning an interurban packing route. Every city in New York State is not a large one, and I believe that too many of us are prone to start our routes too early in the season and run them too late in the fall. A few of our outside customers inform us that the company which starts its packing route first will have their business and consequently, there is a grand rush to see who will get on the ground first.

This often happens in spite of the fact, that we all know it is too early in the season for the people to commence consuming ice cream on a large scale. Such practice goes on year after year in the locality with which I am particularly familiar, and we all know we are losing money through it.

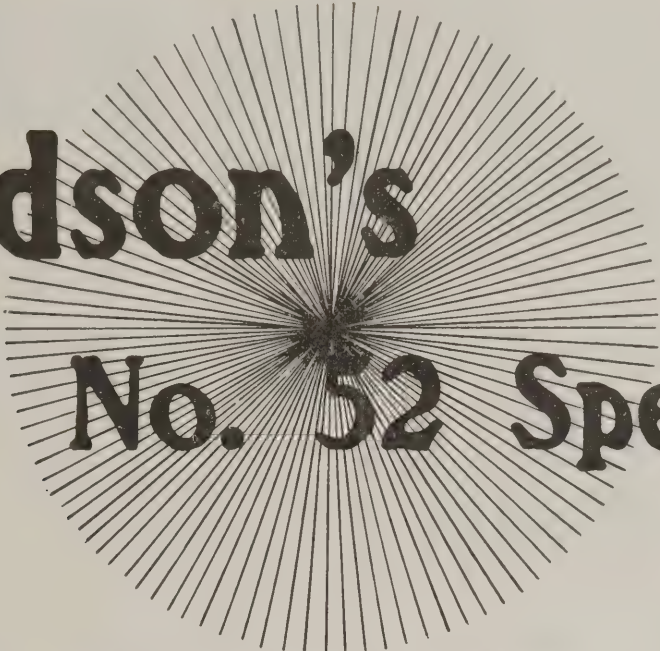

However, this is another question which can be settled only by getting together in our own localities and remedying such conditions by ourselves. Unfortunately our industry contains its proportion of men who measure their success by the number of their "A" signs on the roadside, instead of, by the balance sheet at the end of the year. Some are not staying with us very long, but they are causing their share of trouble while they do.

Speaking of "A" signs on the roadside, I believe one can almost say that the success of a packing route is inversely proportionate to the number of road stands there are on it. This is probably putting it a bit strong and I do maintain that the road stand is more of a hindrance and expense to the majority of us, than it is a gain. It is a condition brought on by competition and we can blame no one but ourselves.

Additional Packing Charge.

Not long ago I read a very interesting article in one of the trade journals on the costs of the interurban packing route. The writer was of the opinion and emphasized the fact, that it naturally costs more to run trucks out of town, than it does around town, and therefore, a charge to cover

Hudson's No. 52 Special

A Vanilla Flavor That Will Capture Your Dealers' Trade

HUDSON'S FAMOUS ICE CREAM FLAVOR No. 52 SPECIAL

\$5.00 per Gallon.....in Barrels
\$5.50 per Gallon.....In Kegs

HUDSON'S FAMOUS ICE CREAM FLAVOR, CONCEN- TRATED No. 52

Six times stronger than Extract
\$25.00 per Gal. Special prices in quan-
tities

EVERY experienced ice cream manufacturer who has gone through the various stages in the development of business volume knows that the flavor of his product always has been and always will be a paramount factor to consider. He knows he has actually captured trade by using a superior flavor; he knows the appeal to the taste is his strongest argument. That's why he is so particular about the flavoring he buys and incorporates into his product; he knows that ice cream reputation is more dependent upon flavor than any other one element.

The majority of manufacturers who have learned this lesson by experience are using HUDSON'S NO. 52 SPECIAL because they can depend upon its purity, its strength, its solubility—and its "trade capturing" flavor. The universal use of HUDSON'S NO. 52 SPECIAL by the large manufacturers is evidence of its superiority and economy. It will win customers for you, too.

Let us ship you a sample keg of No. 52 SPECIAL extract or a sample gallon of Hudson's Concentrated No. 52—Express or freight prepaid to your city. You may return same at our expense if not entirely satisfactory.

that cost should be added to your product delivered by this method out of town.

Undoubtedly, there are many of you who follow the above scheme, but I feel sure there are many of us who have fallen by the wayside in this respect under the strain of competition. I see no logical reason why the out-of-town dealer should receive the same service as the man two blocks from your plant at the same price, when you know that is costing you more to take care of him. An additional charge for packing would make a lot of us feel much more agreeable at the end of the season, and it seems that such a charge is really indispensable if we are in business to make a little profit.

Relatively little need be said regarding the type of bodies best suited for interurban delivery, because we all have our own, many and varied ideas on that subject. We find packing service being given from refrigerated bodies right on down to carrying the cream packed in tubs. Irrespective of all this, we must admit that the condition of the cream upon its arrival at the dealers place of business, will have a great bearing upon the success of the route.

Part of this responsibility naturally falls upon the driver, but we must equip him with an outfit, that will hold the cream in the proper shape at a minimum cost. Whether you will use refrigerated or non-refrigerated bodies is a matter for your own decision. We use both types. The main idea is to hold the ice cream in proper condition and carry enough ice and salt to care for the cream in the cabinets, but not enough to cool soft drinks and drinking water. If any of you have devised a way of combatting the last named practices, I know we shall all be glad to hear about it.

These points which I have discussed more or less in brief seem to me, to be the ones primarily essential for conducting a successful interurban packing route. If a route can be run under the conditions which I have mentioned, it should sell a maximum amount of ice cream and in the last analysis, is that not the deciding factor. This topic is an old one to you, and as one manufacturer put it, "has been discussed at so many conventions that it has whiskers." Undoubtedly such is the truth, but unless we take more action in the future than we have in the past, the whiskers are in for a good long growth.

The interurban packing problem is today a thorn in our side. We accept it like a necessary evil and dread it like a plague. We lost sight of the fact, that we are all interested in a big game only we can not all play. There must always be spectators. Let's follow the rules that dictate the policies about what the other fellow is going to do. Interurban packing routes can be made to pay under certain conditions and I say let the man who can meet those conditions in a profitable manner, reap the reward.

THE DEBT WE OWE TO OUR COMPETITORS.

In commenting upon the findings of LaFollette's committee, Colonel Robert W. Stewart, chairman of the board of directors of the Standard Oil Company of Indiana, said: "During my connection with this company it has never at any time desired nor endeavored to put any competitor out of business. In fact, we believe that our competitors are just as essential to our business as our customers." Strange words these from an officer of a corporation which has always been held up by the soapbox orators as the original seventailed monster. We suspect the statement was discounted very liberally in many quarters. Yet, we for one, believe that Mr. Stewart meant exactly what he said, and consider his statement neither idealistic nor altruistic. It is just plain business sense. A business without competition would soon degenerate into a flabby, rusty, ineffectual affair. It would be a living grave for able men, who, deprived of the vitalizing effect of competition, would soon rust to pieces.—From Sales Management.

Progressive ice cream manufacturers are looking forward to the National Ice Cream Show at Cleveland, October 22-27. You owe it to your industry to attend. The annual convention of the National Association of Ice Cream Manufacturers will be held at the same time.

Package Sundae Kups

The largest ice cream manufacturers are using this container for their packaged sundaes. It is thoroughly practical—presents the best appearance. Strongly made of snow-white pure spruce-wood-fiber. Free from objectionable wax. Self-seating lid. Large unobstructed opening means easy filling and removal of contents. The feature of nesting, when empty, is important—little storage space required.

Printed in one or more colors with your own label. The Mono Paper Spoon is exclusive. Furnished as part of the lid or separately. Lays flat and folds into spoon shape for use. Get our samples and prices and you'll understand why we have successfully served the dairy interests for twelve years with paper packages for various milk products. Our large production facilities are an assurance for quick deliveries.

What's New in Ice Cream?

By PROF. R. M. WASHBURN*

IT IS not a new situation that the producers of cream insistently urge richer ice cream for the purpose of increasing the market for their chief product, butterfat. But the number of bills introduced in the various state legislatures this winter looking toward the increase of the fat content of ice cream from 10 to 12 per cent to as high as 15 to 16 per cent, would indicate greater widespread activity in this direction.

Gentlemen, I am a dairyman, was raised a dairyman, and have been in the dairy business all my life. I like the work, I like the people, and I hope to stay in some division of the industry as long as I am able to work, but I cannot follow some of these movements. It was a mighty good thing for the ice cream industry when it was adopted by the dairy fraternity of this country, for the truth is, the ice cream industry grew up to adolescence—a member of the confectionery family. It is only recently changed affiliations.

Before a legislature committee in a neighbor state recently, I was confronted directly with this question—"If we raise the standard of butterfat for ice cream, will it not enable the cream producer to sell more butterfat?" This would be the result, at least for a short time, but whether it would last is doubtful. Experience shows that an ice cream of 10 per cent fat is relished by more people and can be consumed in larger quantities without surfeit than one of 12 to 14 per cent, and certainly would be preferable to a 16 per cent, such as recommended in a number of bills this winter. But why should the producer of butterfat fat "dally" around to increase the fat content in ice cream when as a matter of fact only four per cent of the dairy products of the country is used in ice cream, whereas 56 per cent is used in butter?

Why does he not go after the butter standard and raise it from 80 to 85 per cent, and thereby do nine times as much business a tone stroke of legislation, as could be done

by raising the fat standard of ice cream a similar amount. But really why stop with butter when more than 46 per cent of the dairy products is consumed as milk and cream?

Why does he not insist that cream for coffee and for general use is increased in fat content, and the create for himself nearly twelve times as much market as he could do by fixing the ice cream standard? But we know that ice cream is not all dairy product, about 10 per cent of the weight is sugar. Why should not the sugar beet farmer insist that hereafter ice cream shall contain less than 16 per cent sugar?

But why stop with dairy foods, why should not the grower insist that fruit cake shall contain not less than 10 per cent so much raisin? But why stop with foods? Why should not the wool grocer insist that hereafter men's clothing shall consist of at least two-third's wool—while at the same time the cotton grower may insist that hereafter men's clothing shall consist of at least two-third's cotton? Where shall we stop? Whenever standards of foods or anything else are set by the people who wish to furnish the raw material for the making of the product—the controversy is bound to end in hard feelings and a deadlock between groups of interest.

A standard adopted for any product should be based on the needs of the consumer of that product for the various ingredients therein. The question of standards is a consumer's problem, not a producer's nor a manufacturer's except insofar as the experience of producer and manufacturer will be needed to prevent the enactment of laws which compliance would be practically impossible.

Total Solids and Weight per Gallon.

In a number of states various workers have endeavored to control the value of a unit volume of ice cream by insisting that there shall be not less than say 33 per cent total solids in the mix, while in other states a minimum weight per gallon for ice cream is suggested. The minimum total solids requirement of 33 per cent is not inconsistent nor would it be troublesome from any standpoint for the simple reason that most manufacturers add more than the amount of their own free will for the purpose of making a quality article. In general the total solids content ranges between 34 and 36 per cent. The relation between total solids and weight per gallon, and percentage swell and content is shown by the table below.

Per cent T. S.	Per cent Swell	Weight per gallon	per gallon
33.0	80	5.0	1.650
36.0	100	4.6	1.656

From the above we note that when a 33 per cent total solids mix is given 80 per cent swell the ice will weigh 1.650 pounds to the gallon, and that a gallon will contain 1.650 pounds food solids. On the other hand, we note that when the mix contains 36 per cent total solids and is given 100 per cent swell the finished gallon will weigh only 4.6 pounds but will contain 1.656 pounds of food. The chief difference between the two ice creams is the matter of air versus water, not a question of amount of food. Another difference, rather a technical one, consists in the ratio of fat to non-fat solids, in which the ice cream of low total solids and low weight per gallon contains more fat in proportion to non-fat than the other, and for this very reason is not as desirable.

Physically cold, chemically hot, might be said of the cream of high fat content. The richer any milk or cream is in fat the higher is the proportion of fat to other solids in such milk or cream. Scientific experiments and long experience agree that milk which is from three and one-half to three and one-half per cent fat, in which there are about two and a half times as much non-fat as fat in the milk food, and in which about 27 to 28 per cent of the solids

WITH the opening of the fall season—the period when banquets, receptions, parties and other indoor social functions are the rule—fancy ice creams and ices are in big demand. Therefore these suggestions; every one a money-maker—a repeater—a volume builder.

Reyam Fruit Custard

is complete without additions or mixing. A half-gallon makes a forty-quart freeze, golden cream in color and deliciously irresistible in taste. Use it to make your work lighter and your sales heavier.

Tutti Frutti Mixture

is just another way of saying “success for mixed fruit ice creams and ices.” It is good to the last drop, always uniform and a bear for building business. Order it now. Like all Reyam products it's guaranteed.

Whole and Broken Maraschino Cherries

Pick the choice of the new crop; packed in all size containers and offered at most attractive prices.

Crushed Orange Pineapple

a delicious combination for ice creams and ices.

Chopped Walnuts in Maple

For maple walnut ice cream; has record for 60% sales increase.

Crushed Peach and Crushed Apricot

Solid pack—cold process—for making fresh fruit creams.

solids is fat, is best adapted to the needs of the young and is much easier digested by older people. The table given below illustrates this matter of ratio of non-fat and percentage amount of fat in solids in cream and ice cream.

Percentage Fat	Ratio S-N-F to Fat	Percentage Fat
	Milk.	
3.00	2.88:1	25.77
3.25	2.65:1	27.38
3.50	2.45:1	28.92
4.00	2.14:1	31.87
4.50	1.89:1	34.58
5.00	1.70:1	37.14
	Cream.	
18.00	0.41:1	71.11
20.00	0.36:1	73.71
25.00	0.21:1	73.91
30.00	0.21:1	82.79

Ice Cream 36% T. S.

8.0	3.50:1	22.2
10.0	2.60:1	27.77
12.0	2.00:1	33.33
14.0	1.56:1	33.88

From the foregoing table we note that the ratio to non-fat in 10 per cent fat, 36 per cent total solids cream is almost identical to that of three and one per cent fat milk, and that the percentage fat in total again is practically identical. The laws of nutrition are universal and constant. They can be violated within narrow limits or for short times but the best ice cream for general consumption and continued use, is one containing from 34 to 36 per cent total solids and 10 per cent fat. The plain and eight per cent in the fruit and nut varieties.

Skim Milk Solids.

Whether introduced in the form of condensed or powdered milk constitute the best base for ice cream. This is true, not only because it blends so harmoniously in the making of good ice cream itself, but because milk solids are without question the best food on earth possessing in richest amount the mineral salts in available form and right ratios to one another, probably the most easily digested and assimilated form and available in the form of milk sugar, and in the form of proteins and vitamins.

To call skim milk solids by the name "filler" applied to ice cream is just as absurd as it would be when used in bread or cheese, a better article is more nutritious, and most valuable generally in both cases can be made by the use of skim milk solids than without. Furthermore, the use of more and more of skim milk tends to balance the usage of the dairy constituents of milk and save waste.

Millions of gallons of "liquid lean meat" are poured down the sewer and rivers annually in this country. The cows produced them from the most expensive kind of food and when produced they constitute our most valuable type of food and the most can be used in ice cream, bread, etc., the better for the dairy industry, as well as for consumers.

Viscosity or Stickiness in the mix is essential to form yield and quality. Viscosity in the milk is caused by the fibres and filaments of casein uniting and binding one with another in the milk and clinging together into minute threads such as blood will coagulate upon exposure to air, so does milk and cream upon exposure. Any violent treatment, such as separation, pasteurization and homogenization, destroys the viscosity, breaking up these threads into short bits. The mix is then loose to pour easily like wheat or oats, but after the fragments of casein have reunited the viscosity will be retarded, because each particle will cling one farther back. Viscosity may be produced in one or more of three ways.

(a) **Aging.**—Old mix is more viscous than new even though no acid has developed in the mix.

We can't do this—

When Merrell-Soule Powdered Skimmed Milk is Used

YOUR milk supply can't keep you on the run—can't eat up your profit through extra handling costs, extra refrigeration, extra sanitary precautions—when you use Merrell-Soule Powdered Skimmed Milk.

Merrell-Soule Powdered Skimmed Milk can be ordered in barrel lots. No ice is needed to keep

it. Just put the barrels in your store room and add water to whatever quantity is needed for the day or special purpose.

You can guarantee your product when you use Merrell-Soule Powdered Skimmed Milk as this milk is always uniform and of guaranteed grade.

There is *profit* for you in

MERRELL-SOULE Powdered Skimmed Milk

MERRELL-SOULE COMPANY, Syracuse, N. Y.

PERITY FOLLOWS THE DAIRY COW. Be sure you attend the National Dairy Exposition—Syracuse, N. Y., Oct. 5-13.

It is liable, however, if held too long to develop a stale old flavor.

(b) **Acidity.**—Lactic acid works upon the casein to harden it, the first stages of which increase viscosity. The danger in the use of this method is that if carried slightly too far a sour taste will be developed, and if altogether too far a lessened yield will result, because the casein has become brittle.

(c) **Enzymes.**—There are two or more natural enzymes which may be used separately, or in conjunction, which have the effect of increasing the viscosity or even in curdling the mix outright if carried too far. These always work fastest at a moderately warm temperature, and slowly at a cold. The best combination for uniformity of viscosity and prompt work is a combination of an enzyme improver, and time.

Swell.—Is the name given to the increase in volume in ice cream and it is brought about purely by the incorporation of air. In one good book on ice cream making, there has been made the statement that "freezing incorporates air into the ice cream." This is an erroneous statement—the freezing merely extracts heat units, with or without the incorporation of air. Swell is due to the incorporation of air, with or without the freezing.

A clear concept and control of the process of freezing and swell may be obtained only when these two factors are considered separately, as occurring at the same time. If we freeze too fast the beater has not time to incorporate a sufficient amount of air, and we get a low yield. If, on the other hand, the beater runs too rapidly for the freezing the cream is beaten too much before the freezing will have taken place, and there is too much swell. The mix when first introduced to the freezer is too thin and sloppy to retain much of

the air beaten into it. The swell commences only most of the heat units have been extracted and swell continues only until sufficient heat units have removed to bring the mix to the point of true freeze. After this point is reached further beating only the mix down and lessens the yield. It is preferable to over swell a little and beat back to the desired than to stop the freezer and draw on the up. Swell, or the incorporation of air is just as proper ice cream as in bread, angel cake or marshmallow for the same reasons, namely—increases palatability negligible cost.

Overloading.—One common error made by freezer operators is that of over-loading their freezer. In order to incorporate air there must be room for the mix to increase in volume. When it has filled the freezer full it cannot increase—it cannot do the thing up. It is highly important that the cream be weighed or measured if satisfactory results are obtained. The batch measuring devices developed in the past few years are a decided step in the direction.

Ice Cream Scoring.—Butter and cheese have scored for many years, and milk for the past few but ice cream scoring at conventions is a new thing. But why should it not be done the same as the products? The states of California and Kansas are or two in the East have scored ice cream with interest and profit, but probably the most valuable form of this is to hold a school or scoring contest, at the various conventions will score for prizes.

This sort of contest, which is not only a contest between the ice creams of various makes but between men of varying ability, was carried out successfully this winter by Dairy Commissioner, Percy N. Ross, Saskatchewan, Canada, and a prize for the champion scorer, consisting of a loving cup offered by the Canadian Milk Products Limited, was given. In my opinion, the score card used at this contest was very sensible, sensible because practical rather than tedious. The score card employed was as follows:

"Exhibits will be scored and awards made on basis of the following standards:

Items	Possible Score
Flavor and palatability.....	50 p
Texture and body	30 p
Appearance (including color and finish).....	20 p

Total100 p

Flavor to be that of clean sweet dairy product, true vanilla, special avoidance of sour or unpleasant or coarse added flavors. (For the purpose of this

PRICE

The price of a product should be thought of only in terms of ultimate economy. Our gelatine may be lower or higher than some others, but we know that because of its purity and uniformity it cannot be surpassed for true economy.

The length of time we have served some of our best customers is evidence of the fact that our gelatines are not only economical over a long period, but that they are giving satisfaction in every way.

Milligan & Higgins Gelatine Co.

222-224 Front Street

New York City

YOUR CO-OPERATION WITH OUR ADVERTISERS BRINGS DESIRED RESULTS.

petition, true vanilla not necessarily considered superior to a synthetic flavor."

Texture to be fine and uniform, body firm. The whole of velvety consistency—special avoidance of ice crystals, sand grains, butter lumps or other evidence of poor workmanship and little or no recoil when cut with spoon.

Appearance clean, bright, indicating fresh dairy products, clean sugar, and pure flavoring extracts.

It will be noticed that no account whatever is taken of the fat content, assuming that it should be legal, and if it should prove not to be, the entry will be thrown out of consideration entirely, but if legal—that is containing in Canada 10 per cent fat or more, it should have full standing, even though some others may have more fat.

It will further be observed that bacteria count is also omitted. This again is a desirable provision. People do not buy ice cream for bacteria any more than they do for butterfat. They have a right to their faith in the ordinances and inspectors that whatever is offered shall be safe, wholesome and legal. Then if they like it they eat more of it. We do not test butter for bacteria even though bacteria may have been instrumental in part in bringing about the flavor.

We know that what bacteria there are present are generally harmless and when consumed get the worst of it. Likewise cheese, with its billions of millions of bacteria and molds, is scored on its edible and likeable points, not upon what number of yeasts or molds, or bacteria, may have been employed in its making. In my judgment there is no more reason for testing ice cream for bacteria than there is in testing butter, cheese, jam, or any other such food for bacteria. Bacteria increase in liquid milk very rapidly at times, but not so in ice cream. They die off as the product is held in storage.

A temperature high enough to permit bacterial growth would render the ice cream wholly unfit for consumption. Why load up our score card with incidentals? They only hide the essentials, which in ice cream are pleasing flavor, texture, body and appearance.

Cream Powders or Powdered Creams are becoming more and more available for ice cream making. The powdering of the cream is an easy matter if the right system is employed. The cream when made contains the right percentage amount of fat and non-fatty substances, so that when combined with sugar in right ratio, and water in the right amount, will produce a mix of any desired standard, grade and type. For in-

stance, when a powder containing 56 per cent fat is combined, using 100 pounds of cream powder, 65 pounds of sugar, 300 pounds of water, the result will be 100 pounds of liquid mix containing 12.19 per cent fat and 35.5 per cent sugar, 35.5 per cent total solids. This mix is sufficient to make 100 gallons of finished ice cream. The powder is cheaply shipped and stored and the handling of butter unnecessary.

Powdered Ice Cream Mix is also made successfully and serves excellent purposes where local conditions dictate its use. This powder, like the powdered cream, is easy of manufacture and economical of shipping, keeps from four to eight months, and produces excellent finished product.

The Retail Package for ice cream is now receiving careful attention. The brick was a new thing once, then the brick of several layers was new—each increased ice cream consumption, and then the ice cream cone came on and added a big impetus to the sale of ice cream, and later the famous Eskimo Pie stimulated sales quite materially and is still going. Ice cream Sandwiches, especially from vending machines, have also had an influence. These are all good—where there were more such inventions, but probably the best along this line is the so-called "Icicle."

THE ICICLE is the name given a little paraffin tube which will hold the same amount of ice cream as an ordinary cone. The package is filled, then the top is and hardened and retails as conveniently as a package of gum. No delay and no dirty sleeves on the part of the retailer, as would be the case in stooping to get cones. The consumer carries away his product in a sanitary case which in itself insulates and protects it. He takes off the cap, pushes the bottom up and eats the top and continues to force the ice cream through the tube, eating it as he pleases from the top. This is a good "go" last year and it bids fair to be a good one in increasing the sales of ice cream this year.

Now, gentlemen, I appreciate that very much what I have said is old, not new, to you, but you appreciate that we are not in a class with some of the papers—we cannot create news at will, we must have some invention or some situation for the general public to further light.

Lest You Forget!—The 23rd annual meeting of the National Association of Ice Cream Manufacturers will be held in connection with the second national convention of The Association of Ice Cream Suppliers, Cleveland, October 22-27 inclusive.

What is Quality Ice Cream?

By J. GOULD*

QUALITY from the viewpoint of the dairy commissioner's department is outlined in Sec. 9926 of the General Statutes of Kansas, but a common opinion seems to be that if a 10% fat and 20% total milk solids be reached it will satisfy the law. Then the question in the mind of the manufacturer is, how cheaply can this product be placed on the market, dressed in attractive attire so that it will satisfy the consuming public and make itself constantly in demand.

I feel that the question of "Quality," as it should be discussed here has too many subdivisions for an adequate presentation of the subject under one head and have divided it into four sections. Anyone of which can call forth a good healthy discussion.

1. Quality from the viewpoint of food value.
2. Quality from the viewpoint of cost.
3. Quality of today vs. the old standard.
5. Quality of the bonafide ice cream factory product vs. the kind put out by the kandy kitchen.

I do not feel that the subject was given to me to carry on a discussion of quality from a viewpoint of food value, since this is a matter to be treated scientifically by food specialists, chemists, bacteriologists, or dietitians. We have with us men who make this their business, they **teach** it, and they **preach** it, and they devote their time, and energy studying food values in ice cream.

While I seek out the violator of the law and try to bring him to a realization of his duty, by teaching him the proper methods to pursue in his factory, or bring him to justice in the courts. I will therefore not attempt to talk on the food value, in quality of ice cream.

RICHMOND CEDAR WORKS
RICHMOND, VA.

Quality from the viewpoint of cost is a matter which I do not specialize, since prices fluctuate, and material has to be obtained from different sources under different circumstances, all of which must be worked out at the individual factory and is well beyond the question a man sized job, if the wheels are kept turning and the quality standard always maintained, and at the same time a balance shown at the bank when over-head expenses are paid.

Quality and costs can be worked out on paper perhaps, but it appeals to me that experience alone can prove to the manufacturer how quality and costs can be worked out. Therefore system in every department, an expert at finding and stopping the leaks is just as essential in the office as the pasteurizer and freezer in the plant.

Observation has taught me that the man who depends on the word of the other fellow as to the butterfat test of his milk or cream used in making ice cream and makes no effort to keep account of his quality and costs, ends the season with his balance on the wrong side of the sheet and the bank holding a mortgage on his equipment. This same man perhaps expects his patrons to return in good conditions his packers, as the law requires, and at the end of the season an inspector may find a large quantity of them in a rusty and rotten condition, back of some drug store or restaurant.

The cost of quality is like the boiling pot in the camp, it must be watched. A hap-hazard system in the factory and office is sure to result in a sacrifice to quality for profit.

Considering the subject from the angle of production of the new standard vs. the old. I realize there is a wide spread of opinion, and criticism has gone forth from different sources that ice cream is not as good now as it used to be. But from the standpoint of uniformity I think there is far less variation, because firms at one time made an 8 and 10 per cent ice cream, in defiance of the law, now are making 12 per cent, and others who made 16 to 20 per cent thinking that was the meant **quality**, have cut from 12 to 14 per cent and the two extremes have come closer together and a uniform product is the result.

The enforcing of the new ice cream law right from the start was a task of no small dimensions, and the opinion seemed to be general that a certain amount of education, and justifiable leniency in cases of ignorance, should be practiced by the dairy commissioner's department. It has required a longer time than anticipated to line up all offenders and bring about general compliance. However, the task has been gone through with, and experience has taught us that

regulations are necessary and some have already made and are being put into service, this we believe have a marked improvement on the quality of ice cream especially in the smaller plants.

When the fat standard was all that was required and pasteurization was not considered necessary, a batch of cream and milk, sugar and flavoring could be thrown into a freezer in the back room and "The ice cream in town," dished out to the public. But with the coming into existence of the new ice cream standards where food values were required, a standardized method of used, pasteurization necessary, and sanitation, sterilization, and refrigeration a working part of the ice cream room, then men began to realize the force of the law and even some Kansas lawyers learned for the first time that Kansas has an ice cream law. Any person familiar with the old order of things, and who will think back to the time when ice cream was made as a frozen dairy only, can not argue that the present day standard of make of ice cream is inferior to the old standard. It has ceased long ago to argue or discuss the question.

This brings us to the fourth section of the subject.

Quality of the bonafide ice cream vs. the ordinary candy kitchen output. I have no desire to work a ship on the small manufacturer, or place unnecessary rules or requirements on him that will make him ruin his business, when he is endeavoring to conduct a legitimate factory and the present law does not make demands or place requirements that can not be lived to in the small factory.

However, I am frank to say and have no apology to make in saying it, that we have a number of back rooms of the candy shops, and dark, damp, cellars where I believe ice cream should not be permitted to be manufactured. Complaints have come to us that pasteurization was impossible in these small plants and we have overcome this objection by showing them how it can be done. We have made plans for ranging rooms so that proper sanitation and light can be furnished. We have taken particular pains to make small batch mixes and in every way tried to help the man who thought the law was made to get him, and ruin his business, and many times while making inspections and endeavoring to give these men a hand in their business by showing them a better method, have been rewarded by having them defy all inspections and deny our right to give orders, and inform that "Everybody thinks their ice cream is the best in town."

Knowing the utter uselessness of trying to teach some of these fellows how to prepare a lawful product, we have resorted to advising them to buy their mix already standardized, and pasteurized. I explain the necessity of keeping it at a low temperature, frozen, and this has brought a certain amount of light to the clouded minds of these candy makers, and I believe, the solution to their difficulties and a relief to many of ours.

Lack of authority, is all that has kept me from issuing orders to proprietors of restaurants and drug stores to buy a prepared mix that complies with the law. One thing we have required is that whenever the milk or cream from a pasteurizing plant, that a label accompany each order, showing the milk or cream had been pasteurized. And this brings to light the weak places in the present method.

It matters not how careful the dairyman may be in producing pure milk, and it matters not how well standardized and pasteurized and cooled and packed, the prepared mix may be when it leaves the factory, if it is dumped into a dirty can in the restaurant kitchen or candy shop, and frozen in an ill smelling room.

the proprietor does not know the first principles of sanitation and can't read the orders left by an inspector, how much good has been accomplished by compelling this man to buy his mix already prepared. I may be criticised for saying what I think. That the public would receive a much better quality of ice cream and the chances for contamination less, if candy shops and other vendors were forced to buy their ice cream from a well equipped and regularly inspected factory, when conditions can and will be kept right.

What chance for example would butter, churned in a cream station, connected with a produce house, have with the present day high standard butter manufactured in a modern creamery.

Orders have been issued by the state dairy commissioner, Mr. Jones, that the ice cream factory if connected with any other business, except a creamery, must have a separate room in which to make ice cream. This is another step towards ideal conditions, but will not bring all the desired results, because it will be impossible to regulate all small factories to the extent that a high quality will be maintained.

J. FRANK SMITH BEFORE KANSAS ASSOCIATION.

Mr. Smith urged the Kansas members to get busy at once with their friends in the legislature and urged them to submit an amendment to the constitution authorizing the state of Kansas to build a complete system of 365-day roads. The entire cost of building and upkeep to be paid from the automobile license fees and a possible small tax on gasoline. He explained that this plan was already in operation in 19 states and was meeting the unqualified approval of all the people in these states where now in operation. This plan would

relieve the people of Kansas from property taxes at the same time meet the federal aid and construct 6,500 miles of main roads connecting every county and principal market center. This plan would also include reimbursement to the people who have already constructed durable roads on sections of the state highways. Unless the legislature, now in session, adopts this amendment, road building in Kansas is to drag for the next two years.

Prosperity in Kansas Would Help Ice Cream Business

Mr. Smith told the ice cream makers that what Kansas most needed was to adopt the Wisconsin plan of dairy cows, crop rotations, diversified farming and roads to more than double the gross income to the farmers of the state and thereby increase the prosperity of every citizen of Kansas. He told the delegates he had recently spent three weeks making a close investigation of farming methods in Wisconsin. He learned that by means of the dairy cow, the silo, constant fertilizing of the fields, crop rotation and 24,500 miles of hard roads, the farmers of that state were making their improved lands yield more than double the improved acres in Kansas.

He explained that the corn yield in Wisconsin has been increasing per acre for the last 37 years, while in Kansas it had been decreasing. The same was true of wheat, oats and all other field crops. He showed statistics that if the average yield of corn in Kansas in 1921 had been as good as that in Wisconsin, the increased value of the Kansas corn crop for that year would be \$48,549,925. He also showed from statistics that the average yield of wheat per acre in Wisconsin for the past 7 years was 19.8 bushels. While in Kansas it was 13.5 bushels. At the average price per bushel for the past 7 years and the average number of bushels put to wheat during that time the value of the increase per year in Kansas wheat crop would be \$72,764,735. In five years, the increase would amount to \$363,823,675.

The dairy products in Wisconsin for 1920 were valued at \$894,178. In Kansas \$55,846,788. The average gross income per cow in Wisconsin was \$126.16. In Kansas \$91.57. If every Kansas cow would produce as much milk as the average Wisconsin cow, the gross income to the farmer for this increased production would be \$21,093,985.

Prosperity Means More Ice Cream.

According to statistics the ice cream produced in the U. S. in 1919 was 248,381,975 gallons, which sold at retail for \$496,763,950. In 1920 the production was 257,820,490 gallons, which retailed at \$638,384,815. Due to the general depression in business the demand for ice cream in 1922 suffered a slump and the total production was 242,288,000 gallons which retailed at \$518,449,000. Mr. Smith submitted these figures to show that ice cream consumption always followed increased prosperity and urged the ice cream manufacturers to get behind a constructive program in Kansas. This would mean greater returns to the farmers and increased prosperity to everybody in the state.

Three Gallons Per Year Per Person.

Reports indicate that the average consumption of ice cream per person in the U. S. amounts to approximately 3 gallons, or an average of about one dish of ice cream per week. To make these three gallons, requires about 42 gallons of whole milk. The average consumption of whole milk in various forms of dairy products is approximately 42 gallons per capita in the U. S. If the people of the U. S. would eat one more dish of ice cream per week it would practically double the consumption of ice cream and increase the whole milk production 100 per cent over the present output.

What Delft Has Done for Users of Gelatine

Do you remember the uncertain and unsatisfactory condition of the gelatine industry before Delft entered the field?

Compare it with present conditions, when every shipment of Delft Gelatine is accompanied by a scientific analysis of its contents; when every shipment is guaranteed free from harmful and liquefying bacteria when delivered; its color and clarity and strength **absolutely uniform.**

The example of Delft has been followed by others, resulting in the raising of standards throughout the trade. But the ideals which gave Delft its leadership will continue to keep it **the World's Best Food Gelatine.**

Think This Over!

"People taste with their eyes about as much as they do with their tongues."

There is much truth in that statement, and it comes from a practical ice cream man who knows human nature. His success proves that.

Allen Sanitary One Piece Can Liners

add that touch of sanitation that magnifies the goodness of your product. Certainly the Can Liner makes the first impression more inviting. It at once reflects on the care you take to deliver a thoroughly sanitary food product. Besides—the Allen Can Liners lengthen the life of your cans. They are practical in every way and an economy.

YOUR CO-OPERATION WITH OUR ADVERTISERS BRINGS DESIRED RESULTS.

DRY-ZERO INSULATION COMPANY

Chicago, June 25, 1923.

This organization controls all the Dry-Zero Patents (five separate Patents already granted and one applied for) both United States and foreign (10 foreign principal countries). It is not only developing distribution to meet the needs of the markets for a great variety of refrigerating units—from Refrigerating Railroad Cars to "carry-home" ice cream containers—but is originating new uses for the extraordinary high-duty, light weight insulant known as "Dry-Zero."

During the past two years, the following Dry-Zero Units have been made, sold and placed in steady commercial service, with the results stated. Invariably the actual results in commercial service of these various Dry-Zero Units have been very much better than we claimed for them.

Dry-Zero Refrigerated Truck Bodies, for Ice Cream, Fish, Dairy Products, etc.

These Units have shown a saving in weight, as compared to other well-built makes, of from 22% to 28%. They have shown an amazingly low consumption of the refrigerating ice and salt. In the case of the Dry-Zero Ice Cream Bodies, not only have temperatures down to Zero been obtained in service, but in many cases they have constantly run with the Brine Tank being charged with ice and salt only every third day, instead of every day. It is safe to say that this saving in weight and ice consumption amounts to as much as \$1.00 per day compared to the next best insulated Body—much more than that in comparison to several makes—and adding long life to the chassis over the old style body.

Dry-Zero Ice Cream Cabinets.

This is actually one of the most important of the present Dry-Zero Units, both because of the vast number of these articles purchased each year, and also because the Dry-Zero Cabinet is absolutely revolutionary in its daily cash saving to the Ice Cream manufacturer. In ice and salt alone a "2-hole-5" Dry-Zero Cabinet saves at least 8c a day; in driver's labor hours it saves another 6c, and as it enables the manufacturer to reduce his truck fleet by about one-third, its pro-rata of this saving comes to not less than 3c a day; a total of 17c. This is a saving for say 6 months yearly service, of over \$30.00. As a fair sized Ice Cream Company will have about 3,000 Cabinets in service for say 6 months per annum, the vital aspect of this Dry-Zero Unit is obvious. Dry-Zero Cabinets require no brick cans or skeletons as they are built to hold either brick or bulk ice cream, or both.

In the Ice Cream Business, the increased cost of delivering ice cream has reached a figure approximately equal to the cost of manufacture. This almost criminal delivery cost has been due to the immense amount of ice and salt required to be hauled around by the trucks, carted by bucket into the cabinets and packed therein. By cutting the cabinet ice and salt in better than half—as Dry-Zero Cabinets do—the saving permeates the entire delivery costs. Imagine, if you can, what it would mean to the Ice Cream trade of the United States, if they were all fully equipped with Dry-Zero Units—a saving in operating costs of upwards of \$20,000,000.00 annually.

Dry-Zero Iceless Shipping Containers.

The only thing that has delayed the marketing of this Unit, has been the difficulty in securing, on the Coast, a satisfactory, strong, cheap exterior. Tests on one of these Dry-Zero Units (made of galvanized exterior and interior) were run by one of the local Ice Cream Companies, to ascertain its value to replace the ice and salt shipping tub. Their findings were that this Dry-Zero Unit kept the cream in perfect condition for 20 hours (without any ice and salt) as against 6 to 8 hours for the tub filled with ice and salt. Further it saved about 40 lbs. in total weight—a very important item in figuring relative express charges.

Unquestionably this Unit has very great possibilities, and in quite a variety of commercial uses aside from Ice Cream.

Dry-Zero Shipping Box.

Some of these Units have been made to test out in actual service. With a fraction under 1½" of Dry-Zero insulation, they tested about 20% more efficient than 2" of Balsa

Wood (heretofore used). Tests are now running strength of construction. (Note: Dry-Zero is more efficient than Balsa Wood, as an insulant, variation being due to the heat leakage through framing of the box.)

Dry-Zero Refrigerator R. R. Cars.

At this date only one of these Units has been and put in service. While no insulation test has been completed, it should be sufficient to say that this car of Dry-Zero as against 1½" of hairfelt (Standard Bureau of Standards tests—as well as our own)—Dry-Zero to have a distinctly higher insulating value than cleanest hairfelt. In addition to the great increasing value—and the consequent anticipated decreasing costs—this Dry-Zero Unit shows a deadweight of between one and two tons, a more sturdy construction, and freedom from the moisture absorption of hairfelt. In construction costs a heavy saving by the complete elimination of nailing strips and some 500 to 600 separate pieces being done away with the labor required to nail these all in place. The completed refrigerator car above mentioned is now en route to Chicago from the Imperial Valley, loaded with melons, on an efficiency test. (This car has now been in Chicago with results fully up to expectations.)

The above are the principal Dry-Zero Units now being put in service either in quantities or in individual cases—all under commercial service conditions. They are on account of being the keystone of the delivery of the Ice Cream business, are further advanced than any other and are creating a furore of interest, but not a panic, as they will be doing as they become generally adopted.

While Dry-Zero Insulation Co. can—and has—supplied Dry-Zero for straight wall insulation, to Ice Cream companies for their hardening rooms, to Meat concerns for brine tanks and chilling rooms, to Dairies for milking rooms, etc., and while our claims as to its superiority over compressed cork, etc., have been more than made good, while its cost is less than cork, nevertheless, it is our policy to reserve Dry-Zero for portable or movable containers, where its extraordinary lightness gives it its value.

COMPARATIVE TECHNICAL DATA.

Dry-Zero—High Duty Insulation.

By Harvey B. Lindsay.

The conductivity, (the reverse of insulating value) of given materials can be and has been ascertained accurately and this quality of any given material is not subject to the opinions or whims of any man, but is a fixed quality and can always be relied upon.

In the following brief table, I give the comparative conductivities of "Dry-Zero" and the three other principal commercial insulants, hairfelt, corkboard and granulated cork. Please note that these figures are taken from the results of careful tests, as reported by the U. S. Bureau of Standards. Our own tests did not vary more than 1% from the Bureau of Standards.

Conductivities per square foot, 1" thick, 24 hours per 1° Fahrenheit difference of temperature, expressed in b. t. u.'s:

"Dry-Zero" (approximately 1 lb. to the cubic ft.)

Hairfelt

Corkboard

Granulated cork (6 lbs. to the cubic ft.)

Note: Value for granulated cork varies considerably but above is a fair average.

"Dry-Zero" has two very striking advantages over other commercial insulant in that it is very efficient in retarding the passage of heat and is of extraordinary lightness. It is highly non-absorbent under the conditions of competent insulation, although of course possible to mulch water into it by mechanical means, but this of course doesn't occur in an insulating material.

by submersion showed it even more averse to than cork. All we claim, however, is that in it is entirely satisfactory.

h insulating value of "Dry-Zero" is simply a fact of nature which no amount of argument or could affect in any way.

ter has often heard the remark, "I know all about

In view of the fact that a number of years have by the writer in consecrated study on that sub- and possibly new viewpoints—with the inevit- sion that he has so far only been able to conceive surface facts of the subject—he would have depressed had the remark been taken seriously. briefly see what is known essentially about heat

Insulation in this sense means, I take it, the ardatation of heat in penetrating various kinds of l as obstructions to its passage. It would seem, that to understand the causes and methods of ation, we must logically know what heat is and r is. And here we are so far up in the air, that en see the ground, let alone the details of the

mple, let us assume both the theoretical mole- ie vibratory theory of heat—that what we call ergy" manifested by inconceivably minute and tions of the inconceivably minute ultimate phys- sion of matter—the "molecule."

w what to do to check this vibration being com- from one "molecule" to the next throughout the should know the construction of the molecule s relations to its fellows. Are they, for example, balls touching each other, molecule, whatever it wn crystalline theory of matter does seem to ex- and other phenomena but it is not yet com- on the other hand, are they separated by the "radiant ether" that under that theory perme- igs—from space to platinum—and that in reality pration of this "fourth state of matter" that car- rant energy, "heat," through the mass?

hypothesis meets with apparently insurmount- ons as our line of thought carries us on through ities of what really happens when we find that "heat" produces flow, and further addition of es apparent independence of the "Molecule"— is.

r mention these little details to try and indicate of the remark referred to.

g practical, let us admit at once that all we at or matter are their direct and indirect mani- o our senses.

his line we have found that heat is retarded aterials that contain chambers of air or other oughly speaking, that in the same material this is reasonably in proportion to the multiplicity ambers, cells or subdivisions containing a gas. nt fact was the foundation for the ancient and ble of "dead air spaces."

r, we also find that although one material may er proportion of such chambers or cells than an- evertheless, permits the passage of heat more n the latter. This would seem to show that the retarding effect of these air or gas filled erstices, there must be one or more other factors tardation of heat through matter.

onsider at this time, however, the subject of en- rtially enclosed air or gas in matter in relation n, and whether it is the air (or gas) per se that retardation (under the absurd "dead air space" me other factor of what we may call porosity, a better name.

definition of a gas, which still does duty toler- s "that form of matter by virtue of which the re in rapid and constant motion."

it is generally admitted that heat can traverse three methods: Convection, (and its larger ulation), Radiation, Conduction. The idea is ection, molecules (being "in rapid and constant ecoming warm at one wall of an air cell by con- ith will—or some of them will—fly across and site wall, unloading their excess burden of heat it is cooler than themselves); by radiation the es the air cell as the sun's heat traverses the

atmospheric envelope of the earth; while by conduction some of the heat of a warmed molecule from the warm side of the air cell is handed to a cooler brother by collision or contact.

In addition of course we have the mass circulation of air from the warm side of the air cell to the cooler—a constant transfer of heat. For it seems absurd to imagine that a cell even one millionth of an inch in diameter does not contain enough freely moving molecules for the warmer to rise and the cooler to sink.

In other words, so far from being "dead air," under the application of heat from one side of the cell or interstice, the contained air is most lively in endeavoring to carry the heat to the cool side. If we grant this to be the case, what then is the possible reason that the air chamber does appear to cause retardation of heat penetration?

Some generally recognized authorities on this subject of infinite guess, ascribe this retardation to what they call "surface resistance," and state that in endeavoring to pass from a solid into a gas or from a gas into a solid, heat meets with resistance.

The explanation of this "surface resistance" seems to the writer to be very simple, and it probably has been stated, though he has never seen it. Apparently it is simple reflection—I say simple, because though we know practically nothing of the essence of matter or heat, we can readily conceive of the reflection of heat.

Several years ago the writer proceeded on this theory as one of the principal factors of heat insulation, in his endeavor to produce a higher duty insulation than had been theretofore commercially used. By eventually confining his research to those materials which offered the greatest total of "surface reflection" within their texture, comparatively rapid progress was made, until—after the usual many failures—the production of "Dry-Zero" was accomplished. This insulant has nearly 40% greater resistance to heat penetration than cork board for example—though being less than 1/10 the weight of the latter.

This fact of extreme lightness in addition to high insulating value, renders "Dry-Zero" particularly valuable for all moving or movable containers.

The first commercial units built using this insulation, were Dry-Zero Ice Cream Truck Bodies. The results obtained with these units by the up-to-date California ice cream companies using them, have fully proved their remarkable value, maintaining as they do temperatures from 0° to 6° Fahr., whether running or standing still. They have actually, in commercial service, hardened cream direct from the freezer.

"Dry-Zero" yielded so high an efficiency in the above service, that Dry-Zero Ice Cream Cabinets were made, and tested by many ice cream companies. They proved that they would harden soft cream on about 2½ lbs. of ice (salt additional) to the gallon of cream per day—although the can does not in any way touch the pack or brine, but is perfectly dry. These units, however, as originally built, were too expensive for the trade. Now, however, they have been improved and incidentally the selling price will be nearly at the level of the ordinary wet pack cabinet of decent quality. Their daily economy is very great, not only in cutting ice consumption by more than 50%, but nearly as important, cutting labor hours in packing cabinets and truck costs in hauling ice, by the same percentage.

"Dry-Zero," which is fully and basicaly protected by U. S. and foreign patents, has since been put to many uses—and new ones are developing every day. Aside from its saving by greater efficiency, its extreme lightness already its saving by greater efficiency, its extreme lightness already stated and its immunity from cracks and voids, results in great economy for all insulating units of a movable character. We have developed some interesting weight figures in this respect.

All of which points to a moral, viz., we cannot change the laws of nature, but by an earnest effort we can perhaps partially grasp some of their fundamentals, and try to suit ourselves to them rather than vainly try to suit them to our desires. This thought is born of the vast amount of nonsense that is spoken and printed even today on the subject of Insulation. Too many attempts have been made to force Nature's laws in the efforts to make otherwise waste materials into competent insulants.

Way down South in Dixie

WITH the passing of the production peak it is easy to see that the South has had its best ice cream year; that is, its best ice cream summer. Now Southern manufacturers are puzzling themselves over the problem of making the stretch of ice cream consumption more sustained. It seems evident that winter consumption will be better this year than ever before.

But why can not the South, with its delightful winter climate, consume at least as much ice cream per capita in the winter as the Northern states? On one hand we hear, "There is tradition to overcome." There was never greater nonsense. In this connection habit is mistaken for tradition. The South has formed the "habit" of eating a little ice cream in the summer and then stopping off almost entirely when the first frost falls on the pumpkin. The soft drink bottlers did not bother over this "tradition." They set to work and developed a lot of business that the ice cream man could get just as well.

At this time Southerners are imbibing soft drinks throughout the year, one especially popular beverage being regarded by some Southerners as essential to beginning the day right.

THE Southern states took the lead in temperance. The soft drink people did not stand back to see if their beverages would "take" in that section; they proceeded to sell them.

That is what must be done in the matter of winter consumption; the idea must be sold. It can be done by keeping cabinets on the job, prodding on the dealers to greater efforts, never letting anyone get from you the suggestion that there is any reason why ice cream purchases should not continue, and carrying on the fight in the campaign direct to the consumer.

Of course, cabinets can not be kept on duty if there is no business for them, but it is a recognized fact that manufacturers in the past have been too willing to invite the impression that business is coming to a standstill. Talk business to your dealers, especially your new ones.

If the Southern public believes soft drinks are refreshing in the winter months, it stands to reason that they can be made to understand that ice cream is not only refreshing but nourishing—sustaining.

IF YOU are figuring on going to the Cleveland Exposition, you can count upon seeing lots of Dixie friends there.

SOME of us in the ice cream industry get so to our work we can't see it. We are in much the same position that Gutzon Borglum, the sculptor, was himself in recently in beginning the work of carving the gigantic Confederate Memorial on Stone Mountain—that great bulk of rock near Atlanta. Borglum depended on the side of the mountain by wire cable, trying to lay out the diagram for General Lee which alone is to be 50 feet high. He found it would have to get into his mind a picture of the general from a distance of 900 feet away. And he had to do that before he could even begin to lay out his plans.

When we lay out our plans to increase consumption in the South, we find ourselves so close to our old procedure, so familiar with the old order of things, and fall of business, we fail to recognize that the Southern public is composed of the same sort of beings to be found anywhere else, and that they are made to recognize the merits of ice cream as a year-round beverage.

GUTZON BORGLUM, who now is proceeding with what will be the greatest memorial of any age—even dwarfing the great stone Sphinx of Egypt—the Colossi of Memnon—says the hardest part of his job was making himself believe that it was possible. Then he forgot the word "impossible."

Remember that, gentlemen of Dixie, while you are tackling this job of boosting winter consumption, it can be done? Anything can be done when it has the energies of such men as George White, J. W. Dixon, John Kloecker, Mike Costa, J. W. Clopton, Campbell, D. W. C. Yarborough, Bill Terry, A. J. Bill Sidebottom—but why name the rest of them?

SOUTHERN secretaries are preparing to stage for their annual pow-wows. More than usual centers around the coming convention. Lines of actions put in motion last year will be for a general checking up. The Southern association will hear reports on its proposed quality standard scheme. The Mississippi association will talk its public educational campaign and the Alabama and Virginia associations will know how it feels to look upon results of one year of organization. Down in Texas there will be many things to occupy the delegates, for the Lone Star gentlemen can always be counted upon for lively doings.

food for thought

THE man who increases quality builds for the future. His business rests upon a firm foundation which competition cannot undermine. He not only increases the public good-will toward his industry, but creates a firmer and greater demand for his product

It has been our aim to manufacture a vanilla based on these principles. *Our product has always been made up to a standard, not down to a price.*

That this has been our "short cut" to success is demonstrated by the ever-increasing demand for

MICHAEL'S MEXICAN VANILLA POWDER

"THE BETTER FLAVOR"

New York Type does not show the bean in the finished ice cream and is adapted for use in districts where the showing of the bean is an objection.

FRONT AND MASTER STS.
PHILADELPHIA

Our Mutual Interests

By N. C. PEARSON*

THE ice cream industry has its Stetsons and its Steinways, who have demonstrated beyond question of doubt that quality is the prime factor in building a permanent following with the consuming public. You realize, too, that most parents, nowadays, keep a watchful eye on the food their children consume, and especially ice cream, and that they buy for their own table use brands which they know to be pure and rich. While a large part of our sales are made at soda fountains to grown-ups, there are several important factors that confront you and I as manufacturers of high-grade ice cream. One of these is the cheap, low-grade ice cream cone. Many of our retail distributors will buy poor cones because they cost a little less than good cones without realizing that the children as well as the grown-ups will seek quality. If they cannot secure a good cone, filled with good ice cream, they will spend their money for soda water or candy. Then our business suffers.

Ice cream manufacturers, you must stand up and face the fact and sell good ice cream cones and urge all salesmen to insist on quality cones.

Enforce State Laws.

The next point of our mutual interest I want to discuss is the enforcement of our state laws. To begin with, I want to say that we have an excellent inspector in the person of P. C. Cromer. He is fair, square and fearless, but one man cannot possibly cover so much territory, and we must ask the State Board of Health to give him more help, as it is impossible for one man to enforce the law as it should be done.

Most of us have spent many thousands of dollars in equipping our plants, complying fully—and often-times more than fully—with the law, not only in butter-fats and solids, but in general sanitary conditions. And, with all modern equipment—with an investment of more than \$40,000.00—the State has permitted several grocery stores to make what they call ice cream, in the old-fashioned unsanitary way, and sell it broadcast at re-

* Laurel, Miss., before State Ice Cream Manufacturers' Association. Jackson, Miss., January 16.

tail. These groceries were located in thickly settled parts of the city, in the manufacturing districts, where people purchased it as a matter of convenience, not because of the purity, the excellence or wholesomeness of the product. It was sweet and cold—had the ice cream color—and that was sufficient.

But, suppose some one should be poisoned from eating this cheap product. The newspapers would report the fact far and wide—POISONED BY EATING ICE CREAM—in big headlines, and the legitimate industry would suffer in consequence. The newspapers could not be likely to explain that the ice cream was of inferior quality, made in a filthy place by filthy hands. It is, therefore, incumbent upon us to insist on the enforcement of the law—to compel sanitation and to keep reporting violators until we get the necessary aid from the state.

Empty Containers.

The next and last matter I want to mention concerning empty containers. The law says that these must be washed when empty, and that each one must be turned in seven days. Oh, Men! Don't you wonder if this law could be even partly enforced? It is a good law. But, as it stands, it is the worst law we ever had. Why? Because it is not enforced. Our customers seldom wash a container when empty, as the law requires. It is kicked off to one side and out the door.

The tub may get a respite because it has less of ice brine that will cool and sell a half dozen of pop, Coco Cola, etc. and sometimes they tell us they think the container was probably stolen some time ago by some one who was making "shinny" some-

Now, isn't that an awful picture for a business to look upon? But, I daresay there isn't a man in the ice cream business who has not had the same picture come before his eyes this season.

Now, in conclusion, let's stop throwing away time and money on tubs and cans and have them enforce the laws. Let's stand together and hold a high standard of ice cream manufacturers.

How the Association Has Helped North Carolina Ice Cream Industry

By A. E. DIXON*

OUR association stands unique, due to the reason that when organized in 1919, with a nominal membership, North Carolina contained only a few scattered ice cream plants, and these on a powder and butter basis. Today, after four years, due to our activity, almost every city has a modern ice cream plant, so stimulating the dairy industry that at the present time the demand exceeds the supply, and large quantities of milk and cream are imported into the state daily.

This condition of affairs will rapidly adjust itself and dairying promises to become an important factor in North Carolina's progress.

During the five years of our existence, the enthusiastic and co-operative spirit shown by the membership, a single failure in any undertaking is yet to be recorded, and we point with pride to this record. Obstacles have been overcome in the past, difficulties will appear in the future, but they will only prove an incentive to

ment.

Our association, through its members, is the state association to inaugurate the custom of serving ice cream bountifully to every orphan in the state, regardless of race or creed, on Thanksgiving Day. Last year nearly three thousand were served in the various institutions. It is the ardent wish of our members that this beautiful custom may become national in its scope, and that each state organization will adopt it as their own.

In conclusion, our association would be remiss in its duty if it did not mention, with gratitude, the valuable assistance it has had from the trade journals, who are members, and whose spirit of co-operation has never been exceeded by any of the active members. Their technical aid, combined with our enthusiastic common cause, a bright future awaits the North Carolina Ice Cream Manufacturers' Association.

Advertising Ice Cream—Individually and Collectively

By W. D. SEALE*

THE ice cream manufacturer and distributor in our state has only two enemies that are worthy of consideration; every one else and everything else is for him. These two enemies are his own lazy self—not necessarily the kind of laziness that he would miss a train with a shipment rather than comply with his Big Ben's suggestion that it is time to go—but by closing his eyes and ears to the thousand and one little things that, if seen and acted upon as they rise, would clinch and hold for the ice cream manufacturer that part of the commercial activity that the product is entitled to; and second, the fellows engaged in manufacturing and distributing other commodities which are sold, you might say—in competition with ice cream, and they are up and doing. You all know the products in mind. They really should not be in competition with ice cream as our product is worth all its cost as a food alone aside from its goodness, but for a long time to come these other products will be in competition with a larger consumption of ice cream, for they are available at practically every place that ice cream is to be had and the public is invited to partake of them and effectively so, many times where it is invited to eat ice cream once.

*Head of Seale-Lily Ice Cream Co. Address before Mississippi Convention, January 17.

I believe it would be safe to say that children eight years of age with five, ten or fifteen cents to in any kind of store where good ice cream is to along with the other concoctions and beverages to consider competitors of ice cream, would almost hundred per cent take our product by preference. It is the case with the grown-ups, and if not, why? The children of that age take what their natural biased appetite calls for. In later years the children are these same persons will acquire a habit for more of other products that are not nearly as good as the taste and practically of no food value and you know why this change comes about, but that same avenue is wide open to us—it is not copyrighted by any one. We know that more ice cream is consumed per capita by children than by the grown-ups and we also know that where the children have ten cents to spend such the grown-ups have a dollar. Another fact that we are well aware of is that in later years, as they grow old, they get back to ice cream in almost the same percentage as in childhood. They have reached a stage in life where they are not guided so much by what they are told to do but, like the child, they eat ice cream because they like it. They know it for they are thoroughly acquainted with the product not only of the ice cream but the principal materials that go to make it up. Now, fellow manufacturers and distributors, if it has fallen our lot to be engaged, while sojourning on this earth, in the manufacture of a product that is taken by preference by anything else in its class by the young and old of the world who are not influenced by any kind of advertising publicity; it we can't by publicity, keep them from what their natural childhood appetites demand in the middle span of life, we have no ones laziness or fore-sightedness or stupidity to blame other than ourselves. C.W.H.

Good Ice Cream Pays.

Good ice cream made and distributed from a source that is well maintained for the manufacture of a product, backed by good service and good prices, will go through the many mediums that are now available. There will be no let up for any other product until the sun at any station in life. Men and women will be lined up at the soda fountain or ice cream parlor just as eager to be served "next" with a nice and delicious ice cream cone as the children.

Gentlemen, for real honest to goodness "ICE CREAM" ice cream has everything else that is up to be in its class backed entirely off the board. You know it—we all know it. How could we not? The demand that we ought to create for our product.

Getting down now to what this paper is up to cover:—Advertising Ice Cream—Individually and Collectively. I will touch the Collective or Co-operative Advertising lightly as, in my opinion, to be the most or rather to be the most effective, it should be done nationally and, as you all know, we are still at any plan that seems to meet with the approval of a large enough percentage of the manufacturers to see in the near future any such move. Perhaps

The Texas Barrel Company

is still manufacturing the best Ice Cream Tub on the market. Our increased sales assure us of that fact.

We were the pioneer makers of the TALL TUB and all other makes are imitations. While we are improving this TUB all the time, our imitators are content to stand still and hang on.

Before ordering Ice Cream Cabinets see the new-style Cabinet we are manufacturing. Will keep cream in frozen state for 48 hours with one icing. It has many advantages over the old box Cabinets. Equipped with casters and handles

and easily moved from one position to another. Does away with leakage and water wastage.

*We handle a full line of ice cream cans in all sizes
Can make immediate delivery.*

THE TELLING-BELLE VERNON CO.

CLEVELAND, O.

EXECUTIVE OFFICE

September 23rd, 1922.

C. E. Rogers & Sons,
Detroit, Mich.

Gentlemen:

We take pleasure in saying that the Rogers condensing pan installed in our new Wellington plant is a great improvement over the pans heretofore used. We find that we can boil at a lower temperature with water at a higher temperature, and with less entrainment loss than has been our experience with other pans. The pan also has a decidedly greater capacity. We are very glad in this way to express our satisfaction with this installation.

Yours very truly,

THE TELLING-BELLE VERNON COMPANY.

PERITY FOLLOWS THE DAIRY COW. Be sure you attend the National Dairy Exposition—Syracuse, N. Y., Oct. 5-13.

have always been for it and at any time a feasible plan can be worked out for such, so far as the little business I represent is concerned, we are ready to spend any amount up to thirty-five per cent of our yearly advertising budget in a general publicity plan regardless of whether it is national—which is much preferable—to cover the south, or even just the State of Mississippi. Really though any advertising attempted is collective advertising, whether it is meant as such or not. If the copy is good and is displayed through the proper mediums I don't think it could be so arranged that at least forty per cent of the efficiency would not be radiated out among fellow manufacturers. I doubt if one really gets for his concern or brand of ice cream over sixty per cent of the advertising efficiency that is created by his efforts. If I am correct in this guess, for it is a guess, we should all be glad if each of the fellow manufacturers would make his advertising budget as large as possible.

Boost—Don't Knock.

One thing I do want to say in connection with advertising ice cream and I might as well say it here and I give this to you as facts—positively—and that is any copy designed to boost your own product and knock the other fellows can't be. Such just simply cannot be done. The result will be you will knock yourself more than the other fellow and you will knock the business as a whole. This has always been the way I looked upon such, so if you want to draw any conclusions take it for granted that I represent the "Knockee" and not the knocker.

Boost your product to the sky and let the other fellow have some of the benefits.

We have been told by people that have had more experience and a better chance to observe from the out-

side than ourselves, that we wasted a lot of money to advertise our product. This is no doubt. We have also been told that we spend what we do hap-hazardly, hit or miss. That is true too, to a extent but we are not going to continue that much longer. They say we should spend from five per cent of our gross sales, depending on things as to whether to make it the larger or the smaller amount in advertising. Personally, I here in the state of Mississippi, where the consumption of ice cream is next to the lowest of any state in the union, that five per cent should be the minimum to spend for publicity. We are all small manufacturers in this state. Small towns, no cities and a large population that we cannot get to with our production factories are so numerous that each of us here small and ever getting smaller territory to cater to. I am going to suggest the following as being my idea to what amount we should spend trying to create a larger demand for ice cream in our territory and am suggesting through what mediums I think experience and observation, would prove the most efficient—At the very least, figure five per cent of year's gross sales and to be spent in about the following manner:

Seale's Suggested System.

Thirty-five per cent for newspaper space—will give live instructive copy.

Twenty-five per cent outdoor signs, billboard signs, etc.

Twenty per cent for direct mailing publicity. There is plenty of this that is especially good to be had.

Twelve per cent indoor signs, picture shows, window cards and inside publicity of any kind that I think will help to clinch what the three first mediums have started.

Eight per cent miscellaneous. Calendars, notes, etc. This to include what might be termed potential advertising; such as space in church programs, newspapers and year books of colleges. This is potential publicity but something all businesses have to have on.

Of the above program I would not suggest starting in winter or summer. If there is a time a little extra gas might be used to the best advantage I think it might be in the early spring and then a little, say in August and September to make the spring speed. Don't by all means drop advertising when winter comes.

Gentlemen, these are my ideas absolutely for ice cream and as to how we should wake up and act I don't care a whoop if they coincide with you, just so they put you to thinking for thinking and to action and that is what is needed.

SOUTHERN ICE CREAM MAN SAILS AUSTRALIA.

"Sam" Rawley has resigned his position with the New Orleans Ice Cream Company, New Orleans and will resume like duties upon his arrival in Australia, where he will care for the manufacture of the modern Americanized plant of the Petaluma Delicacy Company.

Plant equipment was sold by the J. G. Chapman and includes glass-lined equipment, home-made Rogers brick machine and a battery of six 800 watt lamps.

Mr. Rawley's connection with Benjamin Rawley, head of the New Orleans Ice Cream Company, was a period of seven years.

Goes Farther—Costs Less

Cheap gelatine is expensive and it is unsatisfactory. It must be used in larger quantities than a good gelatine. The results are varying.

Better to use a dependable, clear, high-quality gelatine that you know is all right and that will go farther. Although our highly specialized method of making Atlantic super-clarified Gelatine has elevated the manufacturing costs slightly, we sell it at a lower price than other ordinary gelatines of corresponding grades.

And our gelatine is safe.

It easily passes the pure food requirements of every state in the Union. It is of high viscosity, of exceptional purity and clarity. You can't overlook the importance of a *safe* gelatine. Standardize on Atlantic super-clarified Gelatines.

Make the test of trying out our gelatine by ordering a barrel from the nearest office. Use five or fifteen pounds and if it doesn't match up with our claims for it, send the unused portion back. We will pay the freight both ways.

TEXAS ICE CREAM MANUFACTURERS' CONVENTION.

(Continued from page 46)

There are, of course, a great many things still to talk about, but I must quit in a few minutes and let us use any time which I may have left to ask some pertinent questions which might interest you, but they are just a few things which I would like to leave with you before closing.

The first one is, if you are contemplating legislation on ice cream I would suggest you confine it to this point. We don't want to raise the butterfat standard in Texas, that would be impossible. I would like to see a national standard of ten per cent for ice cream. Keep your eight per cent butterfat. Then get nineteen per cent solids, I mean total milk solids. If you have got twenty per cent total milk solids you have to use twelve per cent milk serum solids, that would be a little too high. I wouldn't be satisfied with just eight per cent butterfat, make it eight and nineteen per cent total milk solids, of which you must have eight per cent butterfat, and if you do that you can do anything they want relative to the pasteurization law. These little fellows they want to protect are the fellows that ought to be legislated against. Then on pasteurization. Get your law so it will include the creameries of this state—so that they can't make a pound of creamery butter without thorough pasteurization; and then include in it ice cream, that you can't make any ice cream without thorough pasteurization. In the administration of that pasteurization law the board of health can very easily get the necessary information; they can require you to put an automatic recorder on your pasteurization machine and require you to send the chart in every day, so that they know you are pasteurizing and you

can't get by. Don't allow them to pass a pasteurization law that will exempt the twenty-five gallon machine would absolutely ruin the law, and you know it will ruin it. If the Texas Ice Cream Manufacturers' Association will consent to such a makeshift law I will come down to Texas again. (Applause.) I will sooner take nothing. If you can't get a hundred per cent pasteurization law this time wait two more years until your people become sufficiently enlightened on this subject.

In closing, I would like to say in order to stabilize the ice cream industry, not only in the state of Texas but to stabilize it all over the United States, the thing we must do is to absolutely convince the consuming public that we have an article of merit and that that article of merit is a standard article regardless of where you buy ice cream, and that is an absolute safe article of food. When you do that you are going to stabilize this industry and make it profitable. The next thing you have to do, after you have that, have an article of merit; have an article of merit, is to demand protection by your board of health or by the proper authorities of the state; or protection under the law, so that your good work will not be infringed upon. And then we must be in order to stabilize this business, we must be satisfied with a fair profit on it. But under no circumstances must we as an association—where we are associated together—under no circumstances must we resort to old competitive price cutting schemes. The minimum begin to do that you are hurting the industry and increasing the consumption of ice cream at all; you are not increasing the consumption of ice by undercharging a dealer twenty cents a gallon, you are hurting the business. The dealers will not have any confidence in any factory in this state that sells standard ice cream that claim it is standard ice cream, for twenty years ago a gallon less than some other factory. Six years ago in Oklahoma that is all they were doing; ice cream was selling as low as fifty cents a gallon delivered to the press. I came down to the convention and began to raise sand. I saw some ice cream factories in Texas that were unfit to raise hogs in. What was the reason for it? They had old dilapidated machinery; they had old wooden buildings with concrete floors, every place else in bad shape; they didn't have enough money to buy new equipment, and they cut prices. We began to undersell you don't make a fair profit and you can't keep your factories in good shape, and that is the things you need is to keep these factories in good class shape, in a sanitary condition. I thank you very much for your attention. If you have any questions to ask I shall be very glad to answer you between now and seventy-thirty when I start back for Oklahoma. (Prolonged applause.)

Mr. Boedecker: Would it be out of order for the secretary to read that portion of the law that Mr. Baer referred to, so that we could get his opinion on that. I want to bring out a point in regard to that.

Professor Baer: I might suggest that you have a copy of the law and then I shall be glad to answer any questions and make any suggestions desired.

President Sullivan: Mr. Wren will you please take the chair?

Mr. Wren in the chair.

Mr. Wren: The president asked me to take the chair for a few minutes. It is now time for us to devote the next thirty or forty minutes to the supply of questions, them two or three minutes, or five minutes to make a statement they wish to make, or ask any question they wish to ask. Who wants to talk? If you don't want to talk I am going to call on you.

Mr. Cherry: J. G. Cherry Company are very glad to have the privilege of expressing their appreciation. This has been a most enjoyable meeting, a most intelligent one; I hope we have all profited by the meeting. We wish to express our appreciation for being permitted to attend.

Mr. Wren: I want to make a little statement with reference to the White Caps. The other night when we had our White Caps meeting we failed to attend to any business other than the business we did attend to. We failed to elect officers for the next year. Inasmuch as every one here is a member of the White Caps, I think it is proper now that we elect a set of officers for next year. There are only two officers in the White Caps, one is a president and the other is a secretary and treasurer. I would like to have nominations for the president.

S. S. Lard was duly elected president of the White Caps, and George L. Boedecker, secretary and treasurer of the White Caps.

Mr. Cox: I desire to announce that the Texas Longhorns elected the following officers for the coming year: J. B. Huff, Fort Worth, Texas, president; C. W. Smith, Dallas, Texas, vice-president; H. B. Cox, secretary and treasurer.

Other business was then attended to, followed by the election of officers and directors. These are the officers for 1923: President, J. J. Sullivan, Houston; vice-president, N. C. Mathewson; Secretary-treasurer, A. J. White, San Antonio; directors, L. M. Alexander, Brackenridge; O. D. Dillingham, Ranger; H. T. Pangburn, Fort Worth; George L. Boedecker, Dallas; S. S. Lard, Fort Worth; D. J. Carithers, Wichita Falls; T. H. Thames, Beaumont; R. L. Hargrove, Texarkana and J. M. Studdart, Houston.

Galveston was selected as the next convention city, and the convention adjourned.

Ladies' Auxiliary to S. A. I. C. I. and Other Organizations

New Orleans, La., July 13,

Dear Friend:

Have you heard about the Ladies' Auxiliary Dixie Flyers? If your husband was in New Orleans year I am sure you have, and if you have, I know you will want to join us, and I assure you that we will.

The organization was formed some years ago as a means of making things more congenial for the wives of the Dixie Flyers, and ice cream manufacturers who attended the conventions, but at that time we had not thought of trying to interest the wives who did not attend the convention. We, however, had such a time during the New Orleans convention that we thought there might be many more ladies who would attend the conventions if they only knew how hard they were going to work to make things pleasant for them.

It is essentially a social organization, and is organized solely for the purpose of promoting friendship and making things more interesting for the lady who attends the conventions with her husband. The Ladies' Auxiliary now affords a reason for them to attend the convention, and I feel confident that those present at the New Orleans will want to be among those present at the Rock.

To become a member, one only has to send in the secretary; this pays dues for one year. All the money is used in entertaining the ladies at lunches, or in any other way they may find most pleasant.

Our big affair is a luncheon, given the opening of the convention. This gives us all the opportunity to become acquainted and to make plans for the rest of the week. We decided last year the first was the best, because after breaking bread together, we are like one big family, and can really get together for the big affairs to follow.

So, if you are not a member, do send in your name and let us have you with us for the Little Rock convention; and, if you are a member, we will be glad to see you on opening day.

Many thanks to the women whose enthusiastic interest have made the Ladies' Auxiliary possible, with every good wish, beg to remain,

Most sincerely,

MRS. E. B. GESS
Secretary, The Ladies' Auxiliary

Southern Association Officials Plan Convention "Stunts"

THE opening gun in preparation for the 1923 convention of the Southern Association of Ice Cream Manufacturers was fired last month, when Secretary J. Walter Clopton asked the co-operation of the different state associations represented to make arrangements for special "stunts" to feature the Little Rock meeting. The convention will be held December 4, 5 and 6.

These features, it is promised, will be part of one of the best programs ever drawn up for a Southern convention. Other entertainment features are being worked out, as also the regular business program, it is announced.

The "stunts" will open each session of the convention, each state organization to furnish something original in the "stunt" line. The Arkansas association hosts, will have charge of the opening "stunt". Work on the convention program has reached such stage to assure the delegates of interesting and constant discussions, it is announced.

The Dixie Flyers have taken the situation into consideration, Mr. Clopton advises that the Flyers are sending applications every day. The Marion Hotel will be the convention headquarters. Appointment of convention committees will be made in the near future, officials

* * *

Texans to Meet at Galveston in November

The annual convention of the Texas Ice Cream Manufacturers' Association will be held at Galveston November 26, 27 and 28. Dates were selected with consideration of the convenience of supply men, as well as active members.

Directors of the Texas Ice Cream Manufacturers' Association are expected to meet early in September to

decide upon hotel headquarters and to work out program details in connection with the coming convention at Galveston. Convention committees also will be appointed and go in action at that time. The work of preparing a program also will be taken up. Galveston is one of Texas' most progressive cities and should be an ideal meeting place, officials believe.

* * *

Oklahomans' Association to Meet at Tulsa in November

The annual convention of the Oklahoma Association of Ice Cream Manufacturers will be held at Tulsa November 21, 22 and 23, according to announcement by Secretary J. B. Porter. Officers and directors now are moving with plans toward a live program and an inter-

esting convention in every way. Tulsa made a strong case for the convention. Visitors are assured a heavy attendance will come. The Wolf Hounds, no doubt, will immediately get busy and help put over the convention in fine style as is their usual custom.

* * *

Georgians to Meet Soon

The Georgia Ice Cream Manufacturers' Association is laying plans for its third quarterly meeting, which is expected to be held in Albany some time in October. This will be the last quarterly meeting before the annual convention, which probably will be held early next year.

Three meetings already have been held this year, the first being at Macon, followed by one at Columbus and one at Savannah. Albany is the home of the association's secretary, Sam Marshall, Marshall Ice Cream Co., who is creditably rounding out his first year in office.

* * *

North Carolinians to Meet in January

President Charles E. Landreth will be host to delegates to the annual convention of the North Carolina Ice Cream Manufacturers' Association. The officers and board of directors accepted the president's invitation to meet in Winston-Salem, and January 15 and 16 are the

dates decided upon. The Robert E. Lee Hotel will be the convention headquarters. The North Carolina association is one of the most active state organizations in the industry. Its conventions always provide plenty of thrills. Members, no doubt, are looking forward to a visit to President Landreth's home town.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

RY BENNERS MAKES NEW CONNECTION.

ry A. Benners, charter member of the Southern Association of Ice Cream Manufacturers and for many years active in the ice cream industry in the South, has made up his connection with the Jefferson Island Salt Company and joined the Wadsworth Salt Company, Wadsworth, O.

Southern sales manager of the Wadsworth Salt Company, Mr. Benners continues to make New Orleans his headquarters, occupying his same offices in the United Fruit building. He is also sales agent for the American Salt & Coal Company for the states of Texas, Louisiana and Arkansas.

Mr. Benners is the originator of the slogan "Eat Ice Cream Cream Every Day—It's a Health Food." This slogan was adopted by the Mississippi and Alabama associations. He was one of the seven organizers of the Southern Association of Ice Cream Manufacturers and

given full-hearted support to everything tending to advancement of the industry.

ry Benners has been associated with the Louisiana salt industries since 1901 and is prominently known throughout the eastern half of the United States.

In 1917, Mr. Benners organized the Benners Salt Company to develop the salt deposit at Anse La Butte, but owing to war conditions the company was seriously handicapped in the completion of its plant. The company is today being operated under the name of Lafayette Salt Company and is producing high-grade evaporated salt.

In 1922 Mr. Benners became associated with the Jefferson Island Salt Mining Co., as its Southern sales manager. Opening a new mine, the company required the services of a salt man thoroughly acquainted with conditions throughout the South. The success of Mr. Benners in handling this business is shown by his popularity with the Southern trade as well as the large number of customers he turned over to the company. On April 15, 1923, the Jefferson Island Salt Mining Company decided to close its Southern sales office and concentrate its business at Louisville, Ky., after which Mr. Benners accepted the position of Southern sales manager of the Wadsworth Salt Company.

It was at the Texas convention in 1909 that Mr. Benners and Mr. Gabe Wegener organized the White Mountain Ice Cream Company. Mr. Benners naming the organization. Its membership today extends throughout the United States.

Representatives of ice cream companies should not tell dealers to tell them there is no money in ice cream for the retailer. That is false. There may be no money in it for THAT PARTICULAR DEALER, but he would care to inform himself he will find that the ice cream business is the biggest money maker in many and all stores. This matter lies with him.

PROSPERITY FOLLOWS THE DAIRY COW. Be sure you attend the National Dairy Exposition—Syracuse, N. Y., Oct. 5-13.

Don't Wait Until the Last Minute

and fail to get accommodations in the Convention Hotel.

Time is flying and the Southern Ice Cream Manufacturers and the Dixie Flyers will do well to make reservations now for the 1923 Southern Convention.

Make this your vacation and get here early enough to combine pleasure with business. Make it a point to get here Sunday Dec. 2nd—so you will have an opportunity to look around one of Dixie's most progressive cities before the

Mapleine Ice Cream

one of the best selling
week end specials

A Middlewestern manufacturer told us recently that as a week end special Mapleine Ice Cream sells better than any other flavor.

This manufacturer gave Mapleine Ice Cream its start through featuring it at the week end. As a result, Mapleine has not only become one of the most popular week end flavors, but its bulk sale is so good that Mapleine Ice Cream is run as an every day staple.

You will find Mapleine just as good a flavor, and Mapleine Ice Cream costs less than strawberry or chocolate because Mapleine is so highly concentrated. Two oz. flavor 10 gallons finished ice cream.

Give Mapleine a trial—We guarantee satisfaction

Refrigeration Facts

To any ice cream manufacturer we will gladly send this booklet. It contains some useful information that you will want to keep, besides showing how the Baker Ice Machine is especially adapted to meet every refrigerating problem of the ice cream manufacturer.

The Baker is a slow speed type, which is a positive guarantee of economical operation. Any man knows that if he races a horse at top speed all the time the horse soon wears out—so it is with an ice machine. Some of the first machines built 17 years ago are still in daily service.

Baker Plants are Cheaper Now Than Before the War

Any manufacturer who does not use mechanical refrigeration absolutely loses money every day in cost of operation.

With the new low prices of the Baker Plants there is no need for any company suffering such loss, especially when a Baker will cut manufacturing costs from 50% to 75% over ice and salt.

We will gladly estimate
the cost of installing a
Baker in your plant
without obligation to
you.

Nutting

Ice Cream Can Truck

Durable!

This rugged ice cream can truck will give you years of service. The frame is built like a steel bridge, of structural angle steel, strongly riveted and specially braced at the corners to withstand shocks. Top cannot sag. And it is rust-proof—entirely galvanized.

Easy Rolling. Ball bearing, swivel casters. Main wheels 8 $\frac{1}{4}$ inches high, with wide, smoothly machined flat face to save floors. Cold rolled steel axle, heavy axle boxes and collars.

Size 30x36 inches. Price, \$55.00

F. O. B. Faribault or Chicago.

Also made in two other sizes.

Ask your Jobber or order direct from this ad

Here is another handy truck for hauling goods around the plant. Hardwood platform and sills, heavy corner irons, sturdy pike handle. Wide, flat-faced 12-inch main wheels; big, heavy swivel casters. Cap. 1,500 lbs. Size 24x24. Wt. 140 lbs. Price, Fig. 53, \$13.40. Also made in smaller and larger sizes.

Fig. 53

Trade Notes

Creamery Package Manufacturing Company, 61-67
St. Louis, Chicago, announces the publication of a new
book on the subject of "Davis' Continuous Positive System
of Sterilization." This describes an enclosed tube-in-a-
tube system intended for the big city market milk plant. It
describes three units, the heater, the cooler. It is made in
a capacity of 12,000 pounds per hour capacity, but larger ca-
pacities can be obtained by adding more units.
The use of the design of the system a big cream line, a
pure raw taste, how bacteria count and economical op-
erations are assured.
Readers can secure a free copy of this book by address-
ing the above company and mentioning this paper.

* * *
7. Nordland has given up his connection with The
Sugar Refining Co. to join the T. B. Metzel Co., 909
Market St., Philadelphia. He assumed his new duties
on Oct. 18. Mr. Nordland's connection with the industry
extends over a period of several years. He has many friends in the
industry who will watch his career with the Metzel Company
with interest.

* * *
Little Bear, leader of the Wyandotte tribe, will be
in charge of booth No. 65 at the National Exposition for Ice
Cream Industry in Cleveland October 22-27. The following
representatives of the J. B. Ford Company, manufacturers
of sanitary cleaner and cleanser, will be present:
W. H. Erick, H. S. Cline, L. G. Foulks and E. L. Mead of
Cleveland branch, and J. J. Harris and C. B. Robinson
of Wyandotte office. These men will gladly confer with
visitors on subjects pertaining to sanitary clean-
ing of modern ice cream manufacture, it is announced.

* * *
Ready growth in business is reported by the Black-
burn Pump Co., Petosky, Mich. Sales and shipments
were over 40 per cent ahead of last year, officials
of the firm reported last month. They say many more
pumps could be sold if they could be produced.

* * *
Hughes Gelatine Co., Detroit, announces that G. A.
Hughes has severed his connection with the company and
his duties have been taken over by Charles H. Dunn,
formerly of the company. Mr. Dunn entered the company's
service four and a half years ago. During that time he was
in the company a little more than a year. He returned to the com-
pany in October. He is well known among members of the
industry in the central states.

* * *
August 1 two large manufacturing concerns, the
Brooklyn & Budenberg Mfg. Co. of Brooklyn, and the Amer-
ican Gauge & Valve Mfg. Co. of Boston, each nearly
a century old, were merged into a new
company, the American Schaeffer & Budenberg Corporation.
This, in reality, simply the completion of plans started
some time ago, officials say. There will be no change in the
company's personnel nor in the manufacturing ends of the
company, it is announced. The various plants, including
those in Brooklyn, will be operated as heretofore, manu-
facturing thermometers, gauges, gauge testers, steam traps,
tachometers, engine indicators, temperature control-

Executive offices of the new corporation will also re-
main at the old address, 338 Berry Street, Brooklyn, N. Y.
The combination makes the new corporation the largest
manufacturers of the kind in the world, according to officials.

* * *
United Iron Works, Inc. of Kansas City will be glad
to supply any one interested in mechanical refrigeration or ice
equipment, complete information and catalogs cover-
ing every particular branch of the industry in which they are
engaged. "Sterling" refrigerating and ice making equip-
ment manufactured by the United Iron Works, Inc., has
been in use over a period of thirty years, officials say, its
reliability, dependability and economy—and many large in-
dustries have been made. Requests for information should
be addressed to United Iron Works, Inc., 302 Ridge Arcade
Kansas City, Mo.

BALTIMORE - MARYLAND

The manufacture of Eskimo pie in one size and at one price—five cents—is part of the merchandising plans of the Eskimo Pie Corporation for this year, according to announcement from the advertising counsel of the corporation, the William H. Rankin Co., Chicago.

"A sound operating and merchandising policy will, it is estimated, increase Eskimo pie sales from \$70,000,000 to nearly half a million, which means a winter gallonage of six million," according to the advertising representatives of the corporation.

Last year, it is stated, "despite obstacles and with no definite plans," the season closed with 500 manufacturers producing Eskimo pies. As the results of manufacturers' experiences, there will be "one fundamental plan of operation."

"This year the ice cream manufacturer who is looking for the most winter gallonage at a profit will bank on Eskimo pies to do it," reads the announcement to the trade. Chocolate coating will be high quality and thin, it is stated. It is declared that the new Eskimo pie machine cuts labor costs. The complete advertising, merchandising and operating plan is now ready, it is announced.

The Hudson Manufacturing Company, Chicago, will exhibit its vanilla products at both the Dairy Show and the National Ice Cream Exposition. At Syracuse the company will occupy booths Numbers 161 and 174, and at the Ice Cream Exposition at Cleveland the company will occupy booths Numbers 138, 139, 158 and 159. Officials of the company extend cordial invitation to the ice cream manufacturers of the country attending these exhibitions to make these booths their headquarters. The Hudson Manufacturing Company has had booths at all of the dairy shows and all of the exhibitions staged by The Association of Ice Cream Supply Men, officials say.

* * *

The Oakes & Burger Company, Cataraugus, N. Y., has a new warehouse located at 505 French St., Erie, Pa. Officials say that this establishment will enable them to make better deliveries in western Pennsylvania and eastern Ohio. This store has been in operation less than two months and has already proved its usefulness, members of the company say. A complete stock of machinery and supplies are carried there.

THE rapid success of Swift's Gelatin can be traced directly to that distinguishing virtue of all the Swift Products—Swift quality.

Purity, freedom from taste and odor, good strength, unusual clarity, and dependable uniformity—all these you will find in Swift's Quality Gelatins

The Cincinnati Extract Works has been working time putting out cold process fruits, including orange, apple flavors, etc., according to officials of that firm for several months. The present season, they say, has been the most active in the ice cream business they have ever experienced. Officials say theirs was the first firm to process fruits for the ice cream trade. They attribute the growth of the ice cream trade to improved methods adopted by manufacturers as well as the adoption of high quality products for the manufacture of ice cream.

* * *

Albert A. Senor, who for a number of years has taken the management of the Industrial Products Company, Cleveland, O. It is announced that this firm will manufacture a complete line of enamels and varnishes for the ice cream trade, to be marketed under the trade name "Scotch Colored Boy." Tub and can enamel will be included. Mr. Senor is well known in the ice cream industry and his venture will be watched with interest by many friends.

NORTH DAKOTA ASSOCIATION TO MEET AT GRAND FORKS.

The North Dakota Ice Cream Manufacturers Association announces, through its secretary, Harry L. of Grand Forks, that the 1923 convention will be held at Grand Forks. The convention will be one day to the meeting of the North Dakota Dairymen Association, dates for which have not yet been set.

NEW ENGLAND DATES NOT SET.

Although the New England Association of Ice Cream Manufacturers has not set dates for its annual convention, Secretary W. P. B. Lockwood announces that the convention probably will be held some time during the first three weeks of January. This, however, will not be decided until the September or October meeting.

Ohio Dairy Forces Hold Lively Outing

Business and Pleasure Mixed at Cedar Point Last Month

MEMBERS of the Ohio Dairy Products Association are one group of men who know how to mix a little business with their frolicking and have a game right along. Business was sandwiched in play and frolic at the annual outing at Cedar Point, Ohio, August 7 and 8.

Approximately 200 ice cream manufacturers, cream- and milk dealers attended. Virtually every section of the state was represented. The entire program carried out with much enthusiasm, the spirit displayed being eloquent proof of how well the dairy

with much interest. Mr. Marple is loved by the creamerymen in every state.

The cabaret banquet menu called for "bountiful banquet with noisy and musical courses." It made good all claims for it. The music being furnished by a capable orchestra and the noise coming from outbursts of enthusiasm that did not seem a bit out of place in that jolly gathering of jolly good fellows.

There is no doubt that everybody took from Cedar Point full realization that they had crowded just about as much good time into a period of two days as any average human beings could.

Dancing followed the banquet.

At the Midway Wednesday, casual observers thought that there was something wild besides the deuces.

The order of events at the outing was as follows:

Tuesday, August 7th.

Registration at Association Headquarters—

Off lobby—Hotel Breakers.

Continuous C. C. C. initiation.

12:00 M. Free Lance Luncheon.

3:00 P. M. Acquaintance Renewals and General Visitation.

Water Sports—everybody in bathing suits.

50-yard Men's Running Race in water. Prize—a bottle (?)

50-yard Ladies' Running Race in water. Prize—a bottle (Thermos).

Water Baseball Game—Butter vs. Ice Cream and Milk. Prize of stogies and chewing gum divided 60 per cent and 40 per cent.

9:00 P. M. Everybody dance.

Wednesday, August 8th.

10:00 A. M. Program in Exhibit Hall.

(Continued on page 104)

harmonize in the promotion of the different sections of the industry in that state.

The Ohio gathering of dairy interests always is an interesting occasion. The outing last month was just as fruitful as anything that has gone before. The Lakes Hotel was the revolving point of activities. The famous beach afforded a splendid setting for the sports, the chief feature of which was the water

members of the C. C. C. were very active. The initiated much fun to the occasion.

A suggestion by President C. V. Huenke to set a committee to work on constructive publicity was the result of the one business session held. Mr. Huenke felt there is much the association can do toward the promotion of dairy products in the state through direct to the consuming public. His speech brought forth much favorable comment.

Mr. Coolidge of the Telling, Belle Vernon Company expressed the association's sorrow over the death of Senator Harding, briefly reviewing our late president's private career. Business conditions in general were discussed by Grove Patterson, publisher of the Toledo

W. Marple, of the Beatrice Creamery Company, secretary of the Illinois Creamerymen's Improve-

Protect Quality in Hot Weather —Recommend to Patrons The Use of

By watching the quality of patrons' cream and milk, ice cream manufacturers can add a lot to the quality of their own products. The best scheme of sanitation in the factory does not help milk that leaves the farm high in bacteria content and acidity.

Tell your patrons to rinse their cans with B-K. One trial rinse will prove that clean, sweet-smelling cans may easily be had in hottest weather—hence better milk and cream for you. You can also rid your factory of off odors, mold and bacteria growth by rinsing equipment with cheap B-K dilution.

NEWS FROM FAR AND NEAR.

(Continued from page 100)

Peekskill, N. Y.—The J. M. Horton Ice Cream Company of New York City has taken over the ice cream plant of M. Lockwood's at Peekskill, and has bought a large piece of property running from street to street, 200 feet in width, on which it has erected a cold storage unit and distributing plant. It is the company's idea to give daily distributing service through Peekskill and surrounding territories as far as Albany on the north and Ossining on the south in the Hudson Valley section. The Horton Company has used none of Lockwood's equipment, putting in all brand new machinery.

Columbus, O.—The Crane Ohio Ice Cream Company has put in foundation for a new building. It has not yet been decided just when this building will be erected this season.

McGroon, Pa.—W. H. Klingensmith, who has been engaged in the manufacture of ice cream, has sold the plant to A. E. Sheasley. He will start a new plant some time next year.

Dallas, Tex.—Donnell Ice Cream Company is the name of a new ice cream manufacturing concern recently established at 725-727 West Davis Street.

Seguin, Tex.—The new Guadalupe Creamery, which is being erected just south of the Seguin Ice Plant, is nearing completion. The company has been capitalized at \$25,000.00 and all this will be spent on the plant and equipment. The plant's daily capacity is 3,000 pounds of ice cream and 500 gallons of ice cream. A perfection Standard freezer is installed, as well as a fine still to furnish steam for the plant.

Salt Lake City, Utah—Southeast Dairy has purchased from H. A. Shellenberger equipment for the manufacture of ice cream and the retailing of milk.

Amery, Wis.—The Amery Co-operative Creamery, recently incorporated with capital stock of \$5,000, is manufacturing butter, ice cream and other dairy products. The incorporators are W. J. Fairpoint, Jacob Smith and R. W. Johnson.

Wausaukee, Wis.—Polomis Bros. are building the foundation for a 30 by 50 foot creamery building and a factory to be located on the Polomis farm.

Booth of the Hudson Mfg. Co., at the 1922 National Dairy Exposition. This year the company will occupy Booths Nos. 139, 158 and 159 at Cleveland.

How Are Your Cabinets Lined?

SOME CABINET MANUFACTURERS CLAIM THAT A METAL LINING IS BEST, ON ACCOUNT OF THE FACT THAT IT CAN BE REPLACED EASILY, AND REPAIRED WHEN A LEAK DEVELOPS.

Nelson Cabinets

ARE LINED ENTIRELY OF WOOD AND ARE NOT AFFECTED BY BRINE. WHY NOT HAVE A PERMANENT LINING, ONE WHICH DOES NOT NEED TO BE REPLACED AND WILL NOT CORRODE IN A SHORT TIME?

Forty Years Experience in the Building of Cabinets has Taught us Best Type and Quality of Materials Adapted to Their Construction.

PLANS SHAPE UP FOR SOUTHERN CONVENTION

Little Rock Prepared to Handle Great Gathering—Exhibits
By P. N. MILLER, JR., Secretary-Treasurer Dixie

THE time will soon be here when the Southern Association of Ice Cream Manufacturers will meet again, this time at Little Rock, Ark., for its annual convention. This meeting has been looked forward to with a great deal of pleasure by almost every ice cream manufacturer in the South, and also by every supply man covering the territory.

The writer had the pleasure a short time ago of going to Little Rock. He

P. N. MILLER, JR.

met the genial president of the Arkansas Association, E. A. Watson, went with him to the Marion Hotel where he was instrumental in getting concessions from these people which will assure the association of getting all the hotel can furnish, and when I say all it means as much as any hotel in the South furnishes.

They have first-class accommodations. will be able to take as good—if not better—care of the convention than New Orleans, and that will be going some. They are

equipped to take care of any size meeting place, have ample space for any kind of exhibits which the supply-men may desire to put on, and in fact are going to see that the hotel will be turned over completely to the ice cream manufacturers and their friends during the three days which they will be in session.

The Arkansas "boys" are working day and night to put this meeting over big, and I am sure it will be the biggest and best meeting ever held by the ice cream men of the South.

Kentuckians Lined Up.

From Little Rock I went up to Louisville, Ky., saw our genial, hard-working president of the Dixie Flyers, and the work he has done among the Kentucky ice cream manufacturers and results attained are beyond my power of expressing.

No city in the country had worse conditions confronting them than did the ice cream men of this city, but by persistent work and the use of much tact, the president was able to get these men together, talk over the situation, lay their cards on the table face up, thrash out their shortcomings and see where the trouble lay. The results were wonderful. Eighteen ice cream manufacturers from Louisville and vicinity sent their applications and checks to the Southern Association as members, formed their own local association, a noon-day luncheon club meeting once every two weeks, about to form a Kentucky association, first meeting to be held

at Lexington, Ky., Aug. 30 and enough money subscribed to hire a paid secretary.

This work has been done in three short months all of which was planned and worked out by the president of the Dixie Flyers. More power to him is no one more proud of him than myself, and the good things the ice cream manufacturers say of Neil Mortensen when I talked to them a few days ago makes me feel that the supply men are doing their bit in the building of a bigger and better ice cream business all over the country.

The Kentucky ice cream manufacturers will be the Southern Association meeting at Little Rock, Ark. per cent. That means the rest of the Southern Association will have to keep plugging from now on or else they will carry off all honors at this meeting.

Much Work For Dixie Flyers.

The Dixie Flyers will have a great deal of work to do for them during the Southern association meeting and it will be up to each individual to do his share. Remember that it is not the work of one or two men but the work of all; it is your Dixie Flyers. You for the Dixie association. Up to date it has functioned well.

The ice cream manufacturers of the South are counting on you. They will be so as long as harmony reigns in your ranks, so long as you work with them, so long as you grow; by doing this you will grow with them. All know if any preference is given you always get it. Your individual business proves this. The game is fair at all times. Treat the ice cream manufacturers as you want to be treated and the end will be profitable to both.

Planning For Exhibition.

The question came up when with our president of the Dixie Flyers at Louisville, concerning planning for an exhibit for the Southern association at Little Rock. This will have to be left to the Southern association to decide the houses which the boys covering this immediate territory represent. The quickest way to get this question of opinion will be through our Journals. The *Ice Cream Review*, I know, will be only too glad to help in the matter settled at once. Therefore, I would suggest that the various concerns who have been in the habit of exhibiting from year to year at the Southern Association meetings, either write to the journals or to the secretary of the Dixie Flyers that suitable arrangements may be made. I have assurance at Little Rock that accommodations large enough at the hotel to accommodate of not less than 35 exhibitors. Heavy machinery hardly be accommodated. However, the hotel can accommodate a limited amount of this kind of thing. The expense of installing booths, printing and decorations will not amount to more than \$2500 in a space of 1216 feet.

Naturally it will be necessary to get an opinion first from the directors of the Southern Association whether or not they are in favor of these exhibits. Your secretary will attend to it at once, and as soon as an expression has been forthcoming he will advise you.

(Continued on page 108)

The "Ella" family thank you

THE favorable, successful reception of the "Ella Brand" Ice Cream Compound Flavors proves that the most distinctive of all Ice Cream Flavors are appreciated to an unusual degree.

The reason that you can sell more Orangella, Lemonella or Limella Ice Cream than other flavors is:

*For Ices, Ice Creams
and Sherbets*

Citrus Products Co.
54 East Kinzie St.
Chicago

- because they are distinctively different.
- because they have more "body" to the flavor.
- because they are healthful and delicious.
- because of the advertising of Orangella, Lemonella and Limella.
- because these flavors are known and well established.
- because they are uniform and dependable.

"Ella Brand" flavorings are used in ice creams, ices, frozen custards, milk or water sherbets, parfaits, frappes, punches, brick combinations. Formulas tested and tried by many of the best known and biggest manufacturers are at your disposal. Write for them.

In filling out the coupon just below, please accept in advance our sincere appreciation for your consideration and appreciation.

Gentlemen:—

Please send me sample and price of "Ella Brand" flavor checked, and I agree to give same a fair trial.

Yours truly,

Firm

Address

City

State

Arkansas President Aiding.

Mr. A. E. Watson, president of the Arkansas Association of Ice Cream Manufacturers has generously offered his personal support and co-operation with the Dixie Flyers, assisting them in getting every detail in shape, taking care of all local matters appertaining to the convention, etc. Miss Helen Carmicheal, secretary to Mr. Watson, also has offered her time and attention to take care of all correspondence which might be necessary from now until time of the meeting. With such assistance I am sure everything will be worked out in good shape. What we need now is for the individual Dixie Flyer to get busy, make up your mind at once what should be done, so that when we gather there will be no confusion.

All communications to me from now until time of the convention relative to same, must be addressed care of Watson & Aven Ice Cream Co., Little Rock, Ark. My assistant there will be in constant touch with me, and I can direct her better in city where meeting will be held.

I trust The Ice Cream Review will give this notice the accustomed attention, and from time to time it will be my pleasure communicating with the Dixie Flyers through your Journal.

MUCH INTEREST IN SOUTHEASTERN DAIRY EXHIBITS.

Operators of creameries and ice cream plants in Southeast are taking much interest in the scoring tests to be held at the Southeastern Fair in October 6 to 13. It is expected that entries will be much larger than last year. The Dairy and Southern Cheese Exhibit, under charge of John S. Candler and L. H. Marlatt, has announced the following rules governing the scoring:

SPECIAL RULES.

1. Entries to this department must be made on entry blanks furnished by the Fair Association.
2. Dairy machinery shall be in place not later than Thursday, October 6, 1923.
3. Dairy products for scoring purposes may be sent to the Southeastern Fair, Atlanta, Georgia, all charges paid, and the same will be properly cared for and stored.
4. To compete in this department exhibits may come from Georgia, Florida, Alabama, Mississippi, Louisiana, Tennessee, Kentucky, North Carolina, South Carolina and Virginia.
5. Exhibits of butter and other dairy products received at the Fair not later than the morning of October 6, 1923, and will positively not be accepted after 12 noon, of that day.
6. No entry fee will be required for dairy products in the department.
7. Any of the following shall constitute an exhibit: less than a 10-pound tub and six one-pound prints of every butter, or four pounds of farm or dairy butter, of any variety and not less than five pounds.
8. In making entries, consult the premium list carefully to give the correct department and class number; this is very important in preventing mistakes.
9. Exhibits in cheese or butter, may be made by the name of cheese or butter maker, the creamery or factory owner or the creamery or cheese factory company; only one exhibit in each class will be received from a creamery, cheese factory or individual. This applies to farm and dairy exhibits.
10. Butter or cheese manufactured in a creamery or factory from milk or cream received from more than one herd of cows owned by different persons, firms or corporations shall be classed as creamery butter or cheese, as the case may be.
11. Butter or cheese manufactured from milk of a single herd of cows owned by one person, firm, corporation and manufactured on the premises where the cream is produced shall be classed as farm and dairy.
12. All exhibits for scoring purpose will be sold close of the Fair at the best price obtainable and proceeds sent to the exhibitors without expense to them.

NEW PLANT AT CAMDEN, ARK.

The Camden Ice Cream Company has been incorporated at Camden, Ark., with capital stock of \$100,000 paid up. Officers of the company, which now is in temporary quarters, are: J. R. Jones, president; treasurer; B. D. Jones, vice-president, and Adolph man, secretary.

It is the intention of officers to build or lease quarters.

J. R. Jones, president of the new company, is known as the former president and general manager of the National Ice Cream Company of Little Rock, which company he still is a director.

Progressive ice cream manufacturers are looking forward to the National Ice Cream Show at Camden, October 22-27. You owe it to your industry to attend. The annual convention of the National Association of Ice Cream Manufacturers will be held at the same time.

The Story of Heathization

The STORY OF HEATHIZATION, like the story of Pasteurization, is a story of science brought to serve humanity through bettering a food product of universal use.

For the first time in the history of the ice cream industry, dealers are now offered an ice cream that is Nationally Advertised.

HEATHIZED ICE CREAM is being advertised to millions of readers in magazines of universal circulation.

The story of this wonderful new scientific advance in ice cream manufacturing is being told, simply and forcefully, to the millions who eat ice cream.

Think, Mr. Ice Cream Dealer, what it means to you to sell an ice cream whose fame for purity and excellence is advertised from Maine to California, from Canada to the Gulf!

This is only part of the service we render to Heathizers. An ice cream manufacturer, licensed under the Heath Patents, gets something more than the right to make a better ice cream. We furnish him with merchandising plans that are tried and true. We supply him with advertising material, dealer helps, sales letters, etc. We keep men in the field constantly to assist our clients in developing their business. We gladly render them, free of charge, expert advice in the solution of their manufacturing problems.

WRITE FOR OUR PLAN!

You want to make more money. We will show you how to do it. Look into Heathization today and learn what others are doing. This is an opportunity you will grasp when you know the facts. Write us at address below.

The Femimine Slant

(Continued from page 56)

"But I want to see you again long before that. Why can't you have dinner with me some night this week—anywhere you say—and then go to a theater?"

Susan shook her head. "I've made it a flat rule," she said, "never to mix up business and social life."

"Oh, come now. That rule is as out-of-date as hoop-skirts."

"Maybe," said Susan crisply, "but it's my rule, just the same."

But after a moment, she turned with the friendliest smile in the world.

"You know yourself it wouldn't do. I'm working for a rival concern of yours. You can see how it would look if I were to be seen about with the advertising manager of the Wiley Ice Cream Co."

This floored him for a moment only.

"But you said"—triumphantly—"that you never mixed business and social life. Now you're refusing a purely social invitation on purely business grounds."

Susan smiled.

"You're too clever for me to argue with, Mr. Ledder," she said frankly. "But I know what I must and mustn't do. Thank you for asking me—but I can't go." Susan held out a friendly hand. "It was nice of you to bring me back. Good-by."

And with a smiling nod, she disappeared into the red brick building.

* * *

Ledder saw Susan on the street the next Saturday afternoon. He caught a glimpse of a tiny violet-covered hat and followed it for two blocks for the reward of a pleasant, impersonal smile and nod. It was two weeks

before he saw her again, for just a moment in a lobby. But these scattered meetings were enough to keep her in his mind. Besides, the preliminary tising of Maple Leaf ice cream was creating considerable interest in the Wiley offices—quite enough, to have worried the president of the Maple Leaf had he known of it.

As for Susan, she did not think of Ledder. Donaldson came back late every afternoon with orders, and three days before the day Maple Leaf was to be placed on the market, the climax came, nearly closing time when Donaldson hurried in.

"Just dropped by to tell you I've landed Pre Caterers," he said. "Got 'em signed today. Jenkins will tear his hair when he hears it. He's hounding 'em to death for the order."

Jenkins was a Wiley salesman. Donaldson was out of the office, having told his news, and Susan Willard faced each other across their desks. She was a smart French caterer just opening a business. They knew that Wiley's had been hard after count.

"Miss Meade," said Willard solemnly, "we'll win it!"

"You don't mean De Pre?"

"No—Maple Leaf. We've put it over, before it has appeared on market. We've got enough customers right now to swing the thing through the first season, granted just average hot weather. If we don't get another one from now till October, we can make it get through the winter all right without a hitch. That is the harvest time for quality ice cream. If the stuff doesn't go worth two bits then. If they linked up with the Dalton Creameries, they'd shatter in the winter altogether and make candy."

He rose in his excitement.

"We've done it!" he repeated. "If we can get on to all the customers we've got now, we don't need to worry if we don't get a new one. *** I'll go somewhere together for dinner and celebration, let's! Will you?"

And Susan Alice, the young woman who new to her social and business life, went.

* * *

Susan Alice reached her boarding house a little after 8, to find a telephone message. She was to call 5297 if she came in before 8:30. Puzzled, she dialed the number. A crisp, feminine voice answered her a moment, Miss Meade. Mr. Ledder would like to see you.

"I want to stop around this evening for a few minutes and talk to you," came his big assured voice over the wire. "This is pure business."

"Very well," said Susan. "I'll be glad to."

Once Ledder arrived he went immediately to the purpose of his visit.

"Miss Meade," he said, "we want you in our Co. I don't know what the Maple Leaf is paid for, but we'll double it."

Susan was quite as prompt, quite as direct. "I couldn't, Mr. Ledder," she said. "I've just wished to leave Maple Leaf, I am under contract for a year."

Ledder smiled as a man smiles at a pretty child. He drew a card from his pocket, scribbled something on the back and handed it to Susan.

"Here is the address of Mr. Miller, our lawyer. You take your contract down to him tomorrow."

ICE CREAM CABINET OF QUALITY

The Grand Rapids
ICE CREAM CABINET OF QUALITY

The Most Highly Developed Ice Cream Cabinet Ever Built

Style 7 presented here you will recognize as the most highly developed cabinet ever built. Note the following important structural features in the cut shown above:

Scientific taper style of insulation, originated by us and brought to its highest stage in perfection in this cabinet.

Corkboard insulation all around; 4 inches on bottom, 2 1/4 to 2 3/4 inches on sides, 3 inches on ends.

Armco Ingot Galvanized iron lining backed with heavy coating of specially prepared asphaltum which greatly lengthens life of lining and increases refrigeration and efficiency.

Heavy coating of asphaltum in which corkboard is applied to inner walls. Absorption of moisture is absolutely eliminated and a perfectly air tight wall produced.

Case construction unexcelled. Solid panels of glued cypress and redwood are firmly secured to extra heavy hardwood corner posts. Heavy cross-rails support bottom. Corners reinforced with galvanized iron.

Beautiful mahogany finish on all sides. Improved large brass outlet faucet on end of cabinet.

With a complete knowledge of the cabinet situation nothing but Grand Rapids cabinets will do in your business.

girl I sent you, and he'll see you any time. If he can't find five ways for you to break that contract inside of five minutes, he's no attorney of mine."

"But I don't want to break my contract," said Susan. "I feel the keenest loyalty to Maple Leaf—"

"You have a chance to leave it now," he outlined, "at double the salary they're paying you. Can you be sure of as good an opportunity, say three months from now? You have a year's contract, but the Maple Leaf Ice Cream Co."—he paused impressively—"may not last through the summer."

"Just what," Susan asked, "is going to happen to the Maple Leaf?"

Ledder hesitated a moment and then said:

"The day that Maple Leaf ice cream appears on the market—day after tomorrow—every dealer in the city and surrounding towns will be notified that Wiley ice cream is cut 20 cents a gallon. Some of your customers may last in spite of that, or Maple Leaf may be able to cut its price 20 cents, too, though the shoe will pinch—its manufacturing cost will be higher than ours. Suppose they make the cut, though. Very shortly there will be another. Wiley's will begin offering their dealers surprising discounts, large commissions. How much of this can Maple Leaf meet? Wiley could sell at a loss for a year, if necessary!"

There was a brief silence. The part of Susan Alice that was Alice had turned suddenly sick at heart. The part that was Susan asked levelly, after a moment:

"And then after Maple Leaf finally gives up, Wiley's would begin slowly to go back to their original price?"

"Of course. It would be just an episode for Wiley's. It might be an expensive episode, but Wiley's can stand the expense. I suppose you know that the huge financial backing of the Dalton creameries stands back of Wiley's?"

Susan nodded dully.

Ledder went on:

"Young Willard—your Maple Leaf president with us awhile. He should have known better than to try to buck Wiley's." Ledder paused. "I suppose you thought because we never paid any attention to fellows in the field we'd stand by and see our regular business imperiled." He took a match from his pocket, held it out and then with a smile, snapped it slender stick between thumb and finger.

"Well," he said, "that's Willard!"

He tossed the broken bits into a brocaded velvet jacket and leaned back in his chair, his arms folded, looking questioningly at Susan Alice. Although he returned his look calmly, for the moment she was seeing him. She was looking across a little table at a lard, exultant, boyish, drinking her health with coffee—Willard, who was to be snapped like a puppet by the big fingers of power. She did not speak, and several minutes Ledder said:

"Well?"

Susan Alice rose, abruptly ending the interview. "I suppose you meant to be kind in making that offer, so I thank you. But I don't care to consider it."

Ledder rose, too. He was not accustomed to being dismissed.

"You don't realize what you're doing," he said.

Susan smiled, a defiant little smile.

"You have made it very clear to me just what you're doing, Mr. Ledder," she said. "I've never been a fighter, but when I do get into a fight, I like to win on the same side I start. Good night."

NEW ICE CREAM FACTORY FOR BUFFALO

A new ice cream factory will be in operation in Buffalo, N. Y., within a few months. A committee has been formed and plans are being made for a factory with a capacity of 500,000 gallons of ice cream annually.

W. E. Telling, president of the Telling, Belknap & Co.; J. H. Schindler of the same concern; Val Bendfelt, president of the Bendfelt Ice Cream Co.; Waukegan, Wis., and T. L. Valerius, lately with the Watkins Dairymen's Manufacturing Co., Chicago, are up the personnel of the new organization. Capitalization is for \$1,000,000.

Mr. Valerius is at work on plans and specifications for the new plant.

If a suitable building can be obtained later, it will be remodelled at once, otherwise a new building will be erected.

Ice cream deliveries will be made in specialized trucks and iceless containers in the heat of summer. Tailers will entirely eliminate the necessity for salt.

This new enterprise in no way affects the management of the firms in which the principals are interested. These gentlemen are experienced businessmen and have many friends in the industry who wish them well.

PERSONAL.

Jos. L. Huck, representing the St. Louis Ice Cream Company, St. Louis, Missouri, was a caller in our office one day recently. Mr. Huck was looking after the needs of his firm's many customers.

Look Inside — then Decide

IF MILK can buyers get "the inside" on milk cans before buying, the scrap piles of junked cans would not grow so fast.

Ever see a Solar seamless breast can discarded because the top gave out? Of course you haven't. These heavy gauge, tough, non-crushing, one-piece tops are still good when the rest of the can has given full service.

For years these Solar Seamless Breasts have been used. They have increased the life of all Solar cans by making a longer-lasting breast—the place where more than half of ordinary cans wear out first.

SOLAR MILK CANS

•MADE WITH SOLAR ALL-SEAMLESS BREASTS•

Why are Solar Seamless Breasts so good? The tuff they are made of is different from usual milk can steel. It's the finest sheet steel obtainable—and we pay more money to get it. Then too, it's heavy—2 if not 4 gauges heavier than even the best of other cans. Finally, the whole can top from the curl of the lip down to the flange of the breast is seamless. It is pressed—**cold**—from one sheet of this high-grade steel.

That is the big point—there is not a seam, crack, joint nor separate collar any place in-

side or out. No wonder they last—no seams to open up, to soak in moisture, to corrode, to rust apart nor to collect fat and bacteria. Nothing to prevent cans coming from the washer sweet, clean and sterile.

Now you know why Solar Seamless Breasts stand the racket—they are all one piece—none of those dangerous places for corrosion to work on and gradually destroy (rust out) the structure.

Solar Cans with Seamless Breasts are made in both Eastern and Western patterns—large and small necks with hoops or rolled bottoms.

Get **Solar** Milk Cans from your dealer—or write direct to us for catalog, prices, full information.

AN AMERICAN'S IMPRESSION OF BRITISH ICE CREAM INDUSTRY.

London, W. I., July 14, 1923.

Editor Ice Cream Review:

My impressions of the ice cream industry in England, as gathered from my several weeks visit here, will no doubt prove of interest to yourself and readers of your valued paper.

Here the ice cream industry has just begun to take hold of the public. At present there are only a few manufacturers who will sell 4,000 to 5,000 gallons of ice cream a day; and the method of distribution for those is for the most part confined to their own chocolate and confectionery stores, restaurants, and hotels direct to the consumer.

They do not have the large wholesale ice cream manufacturers as we have in the United States, nor have they the distribution through drug stores as we have. Drug stores here do not handle soda water, ice cream, candies, and cigars, but sell drugs, chemicals and toilet articles only.

The English public, however, show that they like ice cream and with the methods of distribution we have in the United States would soon become larger users thereof.

The principal flavors of ice cream here are vanilla, chocolate and strawberry. One or two of the larger manufacturers are, however, widening their field and putting out specials.

In my opinion it is only a question of time until ice cream will become very popular in England, and large quantities used.

Very truly yours,
SAMUEL H. BAER, President,
Blanke-Baer Extract & Preserving Company.

Before buying a boiler do not fail to investigate the superior merits of the famous

Leffel Scotch Marine Boilers

built by this company for over 40 years in a variety of sizes from 6 H. P. to 100 H. P., and to meet all requirements of the different State Boiler Laws. This boiler is confidently offered as meeting in fullest measure and most satisfactory manner every requirement of the trade, as amply proven by the large number of pleased customers using them for many years.

Why 19

are in use in One City

Model A Ice Cream Packaging Machine in the plant of the Carroll Co., Chicago.

SOME REASONS WHY—

There are 19 Mojonnier Ice Cream Packaging Machines in Chicago alone:

THE MOJONNIER Ice Cream Packaging Machine—

1. Fills exact measured quantity.
2. Keeps Cream untouched by human hands.
3. Insures "fine bulk texture" in "brick ice cream."
4. Fills practically any type of package.
5. Hermetically seals into the finished package the fine flavors used.
6. Reduces "shrinkage" to a minimum.
7. Minimizes loss of ice cream in freezer and hardening rooms.
8. Improves the package.
9. Meets with unqualified endorsement of Dr. John Dill Robertson, for many years Chicago Health Commissioner.

What Chicago manufacturers have done en masse, other ice cream manufacturers from the Atlantic to the Pacific are doing. The Mojonnier method is now becoming the standard method for packaging ice cream of quality. 16-page booklet, "Packaged Ice Cream" sent on request.

ICE CREAM WINDOW DISPLAYS EFFECTIVELY USED BY PHILADELPHIA MANUFACTURER

A sample of the biggest form of dealer co-operation is that offered by The Colonial Ice Cream Co., Philadelphia. Herewith is presented a photo of one of the many attractive window displays prepared by this company for its dealers.

It is published here through the courtesy of Morris Scheck, Scheck Advertising Agency, Philadelphia, who is editor of The Colonial Mixer. The Colonial Mixer is

The windows draw them in, and the service they gives draws them back again. Incidentally, the with initiative can sell them more ice cream than first wanted when they came in. A man often comes my shop for a dish of ice cream and leaves a package for the folks at home.

"Window displays are important, but it takes manship, too."

another form of dealer co-operation followed by the Colonial company. This interesting house organ is distributed among its dealers every month. It tells the dealers facts concerning commercial ice cream which better enables them to use selling points in handling this product.

An idea of how much good attractive window displays do toward helping the dealer sell more ice cream is given in a statement by one of the Colonial company's dealers, Aaron Baylinson, who says:

"My window displays are big factors in the sale of ice cream. Of course, it takes push, but that is necessary to sell anything, if you sell much of it. My idea of the failure of the average dealer to make more money from selling ice cream is, he does not give it the proper sales effort. Couple up sales effort and window displays, and the dealer will have a winning combination.

Other of the attractive window displays prepared by the Colonial company will appear in future issues of The Ice Cream Review.

USES BLOTTERS FOR CHILDREN.

Ice cream advertising on blotters is a form that appeals to school children. The Hydrox Company, Chicago, Ill., gets out a small blotter which advertises Hydrox-Guernsey ice cream. It is in colors and contains a picture of an attractive little girl holding an ice cream cone, and the words "Purest Because Chosen." This is given away from the company's booth at local exhibitions such as food shows and county fairs, and meets the demand of the children for a sort of a souvenir. It is also the right size for enclosing in the regular business envelope.

ELYRIA GLASS ENAMELED STEEL EQUIPMENT

in the plant of the HUTCHINSON ICE CREAM CO.

THE Hutchinson Ice Cream Company of Des Moines recently equipped their new plant with Elyria Glass Enameled Equipment. In this plant, as in every Elyria-equipped plant, the equipment has met with complete success.

The Equipment Consists of—

- One 550-gallon Elyria Open Jacketed Mixer-Pasteurizer.
- Three 1000-gallon Insulated Jacketed Horizontal Storage and Ageing Tanks.

The Operating Results are, briefly—

1. PASTEURIZING—Heating from 35° to 145° in 30 to 35 minutes.
2. STORING—Cooling in storage tanks from 120° to 38° in one hour and a quarter using eight-degree brine.

The Advantages Include the Following—

1. ECONOMY OF SPACE—Compact; placed next to wall.
2. ACCESSIBILITY—Operating mechanism at front.
3. SIMPLE IN DESIGN—Low maintenance costs.
4. EASE OF CLEANING—Inside and Out. No ladders needed—manhole waist-high.
5. REQUIRES LESS SANITARY PIPING—Notice few feet of piping used.

We Invite YOU

to visit booths No. 131, 132 and 133 at the National Ice Cream Exposition. Our representatives will be glad to show you at first hand the advantages of Elyria's latest designs.

If you can't come to the show, by all means get your copy of our new catalog of

JUDGE NOT LEST YE BE JUDGED—CUT NOT LEST SOMEONE ELSE CUTS, TOO.

Cleveland Expected to Shatter all Records

Convention Attendance, Exposition Registration, General Representation of all Industry's Phases, Apparently Sure to Set New Mark in October

ALMOST sixty days in advance of the big convention-and-exposition week of October 22 to 27, inclusive, in Cleveland, it is plainly discernible that the sentiment of the industry is thoroughly and actively engaged in giving to 1923 the distinction of shattering all previous records of attendance at the national get-together, according to announcement from headquarters of The Association of Ice Cream Supply Men.

There seems to be no question on any side that the 1923 annual convention of the National Association of Ice Cream Manufacturers will have the largest attendance this year in the history of the organization. The convention dates are October 22 to 25. The Cleveland headquarters of the Association will be the Cleveland Hotel, and the sessions will be held in the Chamber of Commerce Auditorium, across the Public Square of Cleveland from the Cleveland Hotel, and within an additional three minutes' walk of the great Public Hall, in which will be housed throughout the week the Second National Exposition.

That the second National Exposition will experience the greatest registration that any supply men's show in the history of the industry has known also seems to be universally expected. Men who travel extensively for supply houses are reporting to their companies that many ice cream men who never before attended other than an occasional state convention are planning to visit the second National Exposition and to attend the sessions of the National Association's convention. Supply

houses are receiving reports also that many ice cream manufacturers this year than in any past are planning to send members of their executive staff and their important employees to inspect the exposition.

Hotel Situation Favorable.

The hotel situation in Cleveland fortunately is favorable to an increased attendance at the convention-and-exposition. Conservative reckoning of hotel accommodations that will be available show that six or seven thousand representatives of the ice cream industry could be comfortably taken care of, if necessary, in the year at the time of the conjoined 22nd annual convention and the first National Exposition three other large industrial groups were holding conventions in Cleveland with the result that the late arriving ice cream manufacturers were compelled to seek accommodations in hotels outside of the main business section. This year the ice cream industry has the right of way in all the major Cleveland hotels and, provided reservations are not put off until the last moment every one of the attendance expected will be able to obtain a comfortable room at regular rates in one of the modern downtown large hotels.

Heavy Reservations Reported.

It is understood that reservations running into hundreds of rooms, and many of these double rooms, already have been made for the convention-exposition week.

Members of The Association of Ice Cream Supply Men whose executive offices are in Cleveland have already been in conference with members of the exposition committee of the Association concerning finalized entertainment plans for the week. They have decided it be known, without announcing a complete program, that among the week's entertainment events will be a repetition of the "stag-smoker" which heretofore has characterized large supplymen's expositions. The "smoker" this year, according to the exposition committee, will be along the lines of the one held last year, viewed by 1,200 men, in that it will include many of the highest class entertainers in the country, and will be dignified and brisk throughout. Other events will include one evening's entertainment along unique lines for men and women. There will be entertainment throughout the week for the wives and families of ice cream manufacturers also.

Velvet

Chocolate melted in a Hamilton Steam-Jacketed Copper Kettle is as smooth as velvet.

Velvet-smooth chocolate will certainly not prevent velvety ice cream—will it?

No chocolate ever scorched or spoiled in a Hamilton. Every ice cream factory needs a Hamilton kettle.

Users are boosters.

E. CHAPELL DIES ON GOLF COURSE.

George E. Chapell, millionaire president of the Ice Cream Company, Chicago, and former dairy-farmer, died on the links of the Evanston Golf Course August 12, as he was playing a match with his son, A. A. Chapell. Mr. Chapell had been suffering from heart trouble for some time. He was 68 years old. He was born at Belvidere, Ill., May 20, 1855, and received his education in the public schools and at Oberlin College. He formerly was president and treasurer of the Ice Cream & Chapell Dairy Company, a concern now out of business. He was a member of the Elgin butter board and of the Century club in Elgin. He also belonged to the Birchwood Country, Ridgemoor Golf and other golf clubs. Mr. Chapell's wife died some years ago. He is survived by one daughter.

PACIFIC ASSOCIATION OFFICIALS GETTING READY FOR CONVENTION.

Officials of the Pacific Ice Cream Manufacturers' Association last month were getting an early start toward making plans for the association's annual convention at Vancouver, B. C., December 3, 4 and 5. Secretary H. Walker believes that his members are looking forward to the trip to the Canadian city. Canadian officials of the association have been looking forward to the association for some time, and this interest should conspire happily for a successful convention.

In a recent bulletin to members President W. V. S. Walker and Secretary Walker point out that the heavy season is over and that it is now time to begin plans for attending the convention.

NORTH CAROLINIANS URGED TO ATTEND NATIONAL CONVENTION.

North Carolina ice cream manufacturers are urged to attend the National Exposition and the annual convention of the National Association of Ice Cream Manufacturers at Cleveland next month, in a bulletin issued by J. Dixon, secretary of the North Carolina Ice Cream Manufacturers' Association.

J. Dixon, who has for several years been an enthusiastic supporter of the national association, urges membership of his body to make reservations at the earliest moment. The North Carolina Association was represented by seven members at the national convention. Officials of the Carolina association are much better showing this year.

M. V. KOHNSTAMM DEAD.

Victor Kohnstamm, vice-president of H. Kohnstamm & Co., Inc., New York and Chicago, died suddenly at his home in Chicago on July 22. Mr. Kohnstamm had been in charge of the Western business of the company for 40 years, was born in Bavaria. He was 75 years old. Besides his widow he is survived by three sons, Otto Kohnstamm. The firm is well known to ice cream manufacturers throughout the country.

HAROLD A. SINCLAIR ILL.

Friends of Harold A. Sinclair will learn with regret that he is seriously ill with pneumonia at his summer home at Fisher's Island, New York. His condition had not yet been reached late in August, but Sinclair has always been strong and rugged, and it is expected that he soon will be on the way toward a complete recovery.

Ice Cream Overrun Scale

Eliminates Guesswork and Insures a Uniform Product

No. 4600

Graduated dial gives direct readings in percentage of overrun. Determinations speedily made and with great precision. No calculations necessary. No weights required. No cost to operate. No special skill required. Uses only about two oz. of frozen cream.

Designed at the suggestion of the U. S. Dept. of Agriculture (Dairy Division) and supplied to U. S. Government and prominent ice cream plants for the rapid and accurate determination of overrun or inflation of ice cream.

Container on the left is filled with unfrozen mixture—container on the right with frozen ice cream; the dial pointer moves until scale balances. The percentage of overrun reads directly from dial, reading from 0% to 140%.

The two 4 inch weight plates permit the scale to be used for the ordinary weighing of any commodity up to 2 lbs. (1 kg.) when weights are used. Price, complete with 3 containers.....\$50.00

For sale by leading jobbers.

John Wood Co. "Picnics" in Atlantic City

Every year the John Wood Manufacturing Company and their employees hold a picnic for one day. This year the Pennsylvania Railroad provided a special train with fourteen coaches, and every one was filled with John Wood executives, employees and their families.

The train started from Conshohocken at 7:20 A. M. and made but one stop before reaching Atlantic City. Long before 7:20 the crowd was packed around the station while hundreds of others were lined along the rails of the bridge above.

This was a day that was looked forward to by the men and their families. Morning found them coming over the big stone bridge that crosses the Schuylkill,

and each envelope contained a dollar bill given by president, Mr. Sutcliffe.

Arriving, the crowd separated into many parties. Everyone sought their own particular pleasure. "America's Play Ground." Hundreds went in boats and sunburn was, and still is, the most conspicuous that John Wood held another annual picnic. The room in the factory, officials say, is considering or more oil to replace that used for sunburn this past year.

The ocean and the "Steeple Chase" were most popular with the children, and some of the grown-ups too. Some went in the pool at Heinz's Pier; others went up to the inlet and took a sail.

John Wood Mfg. Company's Family at Picnic.

with bright smiles, and holiday clothes. The children in their frank enjoyment revealed the happy spirit that was shared by all.

A six-piece orchestra played in each coach. As the train crossed the Delaware bridge the entertainment committee opened up the express car ahead and brought

The Committee.

in individual bricks of Colonial ice cream and a basket of pretzels. By actual count we found that ice cream was more popular than pretzels.

The weather was fine, but real hot; regular ice cream weather. About the time everyone had their ice cream eaten, the committee came through with a basket of envelopes. These were given to every child on the train,

and everybody strolled the boardwalk.

With eight miles of boardwalk, and amusement along every foot, you can bet no one had a dull moment and everyone was tired but back at the train at 10 P. M.

There were no stragglers, and everybody was home before midnight. Comment heard since was, the committee handled every detail in splendid shape, that this was about the nicest picnic they have had.

The distance from Conshohocken to Atlantic City is about seventy-five miles, and the train made the trip in two hours. Everything was anticipated and prepared for so that everyone, from the John Wood officials to the smallest kid, voted this a real day, and as they neared home the kids that were not asleep were saying "Yes, We Have No Bananas."

YUNCKER TO REPRESENT ZIPP MANUFACTURING CO. AT EXPOSITION.

Representatives of the Zipp Manufacturing Company, Cleveland, O., will be quartered at Hotel Winton, according to announcement by officials of that firm. The company's exhibit at the Exposition will be in Booth No. 153. C. J. Yuncker, president of the Michigan Ice Cream Boosters, will be in the Zipp company's booth.

You'll make better ice cream if you get "The Ice Cream Review."

FOR SALE—A 100 quart motor driven brine ice cream. Used only a few weeks. A very a price for quick sale. Address R Ice Cream Review.

You can't afford to miss a single the "Ice Cream Review." Did you your renewal?

HAVE YOU HAD YOUR ESKINOODLES?

If you're just an ordinary mortal you've at one time or another apologized to people because you mash your ice cream while nonchalantly spreading it over a piece of pie.

You've done a lot of other things to make the ice cream less solid, too. Now comes C. K. Nelson, the inventor of Eskimo pie, with a life-saver.

It's an aluminum contrivance which produces eskinooodles.

Remember when mother used to put a slice of meat in the meat chopper and it would all come out in noodle like form? Well, that's just exactly what happens to a

scoop of cream when the chopper bears down. Result—eski-noodles.

There are lots of advantages to eski-noodles, ing to C. F. Wade, general counsel of the Eskimo Company.

If you put 'em in a cone, why, you can separate noodles and pour in a little chocolate and make dae out of a plebeian cone.

But think how much more the lady with a te toward sweets can partake of this new confection something to think about—if you're a man and isn't till next week and you're rushing a girl.—Evening American.

Visit us at Cleveland in space No. 125. Arrange to inspect our plant while at the Exposition.

"Save the surface and you save all" Paint & Varnish

Clean Up and Paint Up

These two slogans of the paint trade are particularly applicable to the Ice Cream Industry. Use

selecting bright, attention compelling colors for tubs and cans. Paint your personality on each container, that each one may arrest the attention of the passerby and unconsciously impress him with the quality of your product and the cleanliness of your plant.

There's a DERYCOTE for interior walls and ceilings, as well as one for trucks, wagons and delivery equipment. There are DERYCOTE varnishes and stains for cabinets, and DERYCOTE stencil pastes for tubs.

All are made to meet the peculiar requirements of Ice Cream Manufacturers.

Send for color card. New and lower prices are now in effect.

OCTOBER 1923

MEN engaged in all branches of the dairy industry, at this writing, are packing grips and buying mileage for Syracuse. It seems sure that the great international dairy drama which will reach its climax during the National Dairy Exposition, October 5 to 10, will attract the largest and most representative gathering of dairy interests ever assembled in this country.

Much attention will be given to the ice cream business this year. The dairy show always has held more or less interest for ice cream manufacturers, but it seems that this year there will be more manufacturers of the frozen beverage on hand than ever before.

The industry will be formally represented in the official proceedings by the executive committee of the National Association of Ice Cream Manufacturers, headed by President Charles G. Morris.

The World's Dairy Congress opens at Washington, October 2, with dairying representatives of many foreign countries present. After the carrying out of an interesting international program, the scene shifts to Philadelphia. Then on October 5, attention will be centered on the National Dairy Exposition at Syracuse. Some of the ice cream industry's leading supplymen will be present.

President H. E. Van Norman announces the Ice Cream Review that there will be special feature program for ice cream manufacturers. The ice cream scoring contests.

It is earnestly recommended that ice cream manufacturers visit the dairy show. If nothing to study the progress being made in dairymanship trip will be very profitable.

The ice cream industry is vitally concerned with the welfare of the dairy industry, along with many of other dairy products.

All roads lead to Syracuse. Take one of them.

CLEVELAND is getting ready for her guests. Ice cream manufacturers of that city are looking forward to that role as hosts to the ice cream convention.

Officials of the National Association of Ice Cream Manufacturers report that events rapidly are being prepared up for a lively convention. A good program is prepared.

Officials of The Association of Ice Cream Suppliers say they have plans complete for an exposition of interest. It will be larger and even more spectacular than last year's, we are told.

Last year Cleveland proved itself to be an ideal city for the national ice cream classic. It has, in truth, earned the title of "Capital of the Ice Cream Industry." At least, it can be regarded as a temporary capital during the week beginning October 9, it will be the headquarters of the two great national bodies governing the ice cream industry, and also will receive probably the most representative gathering of ice cream men in the industry's history.

Call it ice cream capital or not, Cleveland this year will be the Mecca for men who look to the advancement of the frozen beverage industry.

WE have good news for readers of The Ice Cream Review. An extra edition will be published on Oct. 15, devoted exclusively to the Convention and its position in Cleveland.

The Ice Cream Review is published on the first of each month. The National Dairy Exposition opens at Syracuse, N. Y., on Oct. 3, while the big dairy show in Cleveland begins Oct. 22.

How to serve these two big events of interest to the ice cream business in one issue, published on the first of the month, was a real problem. We put the question to some of our friends and the suggestion came from several of our advertisers that an extra edition would "do the trick."

That was a splendid suggestion, as subsequent developments have proven, but how to do it was the real question. We took the matter up with the postal authorities and finally succeeded in getting permission to issue an extra edition on the plea that we are really serving the industry by doing so.

has met with the hearty approval of our is the extra edition will prove. They are with us splendidly, and almost without expense the plan. They realize that an issue, exclusively to the Cleveland events, and published a few days prior to the opening date, will cause great interest among ice cream manufacturers and it will result in a greater volume of business (Cleveland).

So this means a lot of extra work in this interests would be better served by combining events but we could not serve the industry. So look for a big Extra Edition of The Review on Oct. 15th. Subscribers will receive it at no cost.

As a world of wisdom in the puzzled observation of the little girl who said, "Grownups is funniest of the grownups think so, too. Children together and have foolish little quarrels, and make them and laugh at their childish serious-children quarrel and "make up." They get on with their playing together.

Business men engaged in the same industry in town, with interests wholly in common, won't take the time to get together and do anything—quarrel together. (They sometimes do that to the other's back.)

At one of the conventions last winter a gentleman associated advertising said, "I've been in this body for five years and I would like to do at least one thing in concert if nothing more could be talked around the block and tell folks to eat ice cream. Everybody said he was right. Yet, this plan is not settled yet!

Grownups "is funny," and grownups in the ice cream industry are just as funny as any others.

Winter weather is coming—in some sections has already arrived. Old Jack Frost is back on the job and whether we want him or not, he is to be with us several months.

There are many reasons to believe that the ice cream industry will work more energetically and more intelligently to boost winter consumption in the future than in the past. We have found out that it can be done, and it can be done should not be put off because of the weather required.

It is too early yet to tell just what the past "season" has been like in volume. The extended cool weather and the fall were keenly felt, it is sure, and sales for the next months probably were not as high as hoped for.

The particularly encouraging feature is the good work going on to uphold volume. People can be taught to eat ice cream in the winter. There are few who still foolishly believe that a cup of warm arms anyone up for cold weather. The temperature of food has nothing to do with the temperature of our bodies.

Every winter little boys and girls run out in the snow, scoop up some of it and make a little "snowball cocktail," flavored with kitchen extracts. Their parents help them eat it.

Some day some ice cream manufacturer with imagination and an understanding of timely appeals to human beings, is going to work up some tempting ads featuring ice cream in snow scenes and winter sports.

When we make ice cream appeal to the imagination, it also appeals to the appetite.

IN THIS issue we are telling the story of the struggles and triumphs of the men, who, year after year, have so generously given their efforts to the upbuilding of dairy prosperity through the National Dairy Show. Men who understand the constructive development promised by this agency will be especially interested. We believe, in reading of the dairy show's beginning and steady growth in the face of all kinds of obstacles. It is important dairy history. Its progress is significantly linked with dairy progress.

We feel that our readers will feel equally as indebted as we to the many folks who have co-operated with us in presenting dates and data in connection with dairy shows of the past, and also to those who have expressed their views upon what the shows of the future promise for the industry's development.

MANY a stormy wind has blown since the ice cream industry first began to take its stand among ranking commercial pursuits. Progress made thus far is most satisfying, and with so much of the early pioneering problems overcome, it should be easy for everybody to recognize the importance of working together for the common weal. When we stand together, stormy winds don't bother so much.

There never was a time when co-operation was more necessary. There never was a time when there was more to be gained by fair and square teamwork or more to be lost by the failure to so act.

Every man with the average human spark of ambition has every right to court success for his own individual enterprise. A full and complete return upon business invested should be expected. But the men who are to do their own business and this industry the most good are the ones with the cool, common courage to recognize that trade and trade practices must be kept safe for the rank and file, and at the same time to realize that so long as one man is to make greater investment of money, effort and facilities, he has every right to commensurate returns.

Slight as it is, the tendency to draw lines of classification in the industry must be discouraged. The only serious danger to the industry lies in those who would be persuaded that there is any danger.

Economically, the ice cream industry is sound. Its

scheme is well defined. Its place in human affairs is well fixed. Out of the travail of early stages it has emerged in a healthy, vigorous condition, with nothing but continued progress and prosperity to be expected if every man sticks to the guns.

The ice cream industry is no place for a quitter. It is no place for a whiner. Every man gets out of it exactly what he puts into it, and if one man forges steadily ahead, it is not the part of sterling American manhood to wish him evil for his success.

The little man and the big man all have important work to do. This work cannot be accomplished by pulling in different directions. It calls for earnest conscientious, co-operative effort. The so-called little man has no one working against him. The only real work that should be recognized is that in which everybody strives toward a greater outlet for every manufacturer of ice cream.

This is no time nor place for quibbling or quarreling. It is no time to call attention to the size of one man's business except in that it shows what all of us can do by building up the market.

Who is the little man in the industry? The only little man in anybody's industry is the man who will not recognize fair play to all.

A man may operate a plant no larger than a cracker box and still be big and broad enough in mind, heart and principle to do his dead level best every day and wish best o'luck to the gentlemen of fortune's favor. Such stock is the backbone of this industry and all the stormy winds will not prevail against it, my masters, from now till kingdom come. Amen.

MANY of us sing our songs and drink our toasts to fair lady without a thought of the full import of our actions. Chivalry? Indeed no. Just common sense. When we sing the glory of the queen of the American home today, we sing of a real queen, a business queen, a buying, bartering, bossing queen. She bosses not only the kiddies (and sometimes hubby) but also dollars.

Milady is a good buyer. She is the best business booster in the land. It should be remembered in pushing ice cream sales that we are not doing business with business men; we are dealing with women, who are more careful in the selection of goods than anybody else.

It is all right to show pictures of pretty girls in impressing the food merits of ice cream, but it must be kept in mind that a healthy, bouncing baby pictured in connection with ice cream is sure to carry appeal. pretty women don't care beans about other pretty women, but men and women of all kinds love their kiddies. Make them feel that ice cream adds to the health and happiness of little ones, and there will be greater interest. But, most important of all, be sure that it is good for little ones and everybody. Then all the people will buy and call you blessed. Otherwise, they will call you something else.

"THAT man just naturally attracts money. How often you hear that or a similar applied to men who succeed. All success. Every man who makes his mark seems to have time of it.

The only man who attracts money is the man who has something that people want. Emerson says: "A man but make better mousetraps than his neighbors, the world will make a pathway to his door."

While that is not all that is necessary in the way of highly competitive advertising campaigns, the product is the safest and most reliable way to lead people to the pathway leading to your door.

SOME ice cream manufacturers remind you of a hack driver who was forever seeing how close he could cut his hack toward a certain high bank and falling over. Let the manufacturer cut too close to the quality and its over the precipice for him.

A VERY time an ice cream manufacturer is paying his "respects" to a competitor, he is making the passage in the Book of Wisdom: "An man opens his mouth and shuts his eyes."

SOME ice cream manufacturers make excuse for a low price rate and an effort to "get by." Others make a quality product and make good.

Plans Shape Up for National Ice Cream Exposition

Supply Association Announces Details of What is Expected to be Greatest Show in Industry's History

THE National Convention-and-Exposition of the ice cream industry, duly scheduled for the week of October 22nd in Cleveland, apparently will open with a bang, according to the Association of Ice Cream Supplymen.

The opening of the doors of the Second National Exposition of The Association of Ice Cream Supply Men will place the ice cream industry among the foremost score of American industries in the size, scope and importance of annual commercial and educational shows, officials of that organization believe.

The opening session of the 23rd annual convention of the National Association of Ice Cream Manufacturers is expected to discover a larger attendance than has ever been present before at any convention session, anywhere, or of any organization, in the ice cream industry.

The show will be in the \$6,000,000 Cleveland Public Hall, where The Association of Ice Cream Supply Men's National Exposition was held last year. Sixty thousand square feet of floor area or an increase of one-third over last year's area will be filled with displays of machinery, supplies, equipment and special services which will cover the entire range of the modern ice cream plant's requirements, as to both producing and merchandising.

The show will open Monday noon, October 22, and will extend throughout Saturday, October 27. The show will close at 6 o'clock promptly each day and will open, after Monday, at 9 o'clock each morning. Adequate luncheon facilities will be provided to accommodate all visitors who do not care to return to their hotels before evening.

Admission to the exposition will be by registration only as has been customary in past years. Any person who can indicate a legitimate interest in the ice cream industry, commercial, manufacturing or educational, will be admitted for such length of time and under such provisions as the regulations of the exposition management will provide.

The first session of the 23rd annual convention of the National Association of Ice Cream Manufacturers

will be held Monday afternoon in the Auditorium, the Chamber of Commerce building, facing the Public Square, about a three minutes' walk from the Public Hall in which the exposition will be held. Further sessions, will occur at hours to be officially announced by the National Association of Ice Cream Manufacturers, on Tuesday, Wednesday and Thursday in the same auditorium. Such program announcements as has been made indicate that all the sessions will be particularly practical, the subjects treated being of a practical nature and of a general discussion.

The Association of Ice Cream Supply Men is in charge of the exposition. The National Association of Ice Cream Manufacturers, which is emphasizing the events of the week, is in no sense completing their inspection of the exposition. On Saturday, the two final days of the exposition, the subjects of the exposition will be arranged for the benefit, The Association of Ice Cream Supply Men, given assurance that the exposition will be a success and other events of special worth while the exposition will occur.

The National Association of Ice Cream Manufacturers will make its headquarters at the Cleveland Hotel, which is in the Chamber of Commerce Auditorium, in which the sessions will be held. The Cleveland Hotel faces the Public Square. The Cleveland Hotel is some five minutes' walk from the Public Hall, where the exposition will be held. The hotel is the headquarters of The Association of Ice Cream Supply Men. The Winton Hotel, which is unable to accommodate all the rooms at the Cleveland

Hotel, no one hotel in the city can accommodate all the ice cream manufacturers who will be present, may be accommodated at the Hollenden, Statler and Olmstead Hotels. The Winton Hotel also is prepared to take care of the overflow of ice cream manufacturers if, after its own men guests are accommodated, its facilities prove

SCHEDULE OF EVENTS

Convention-Exposition Week, Cleveland.

MONDAY MORNING—

- 9 A. M.—Registration of Delegates to National Association of Ice Cream Manufacturers' Convention, Auditorium, Chamber of Commerce.

- 9 A. M.—Exposition opens for day.
- 9:30 A. M.—Convention session, The Association of Ice Cream Supply Men, Public Hall.
- 12 Noon—Entertainment feature for ice cream manufacturers, wives and families, Public Hall.
- 6 P. M.—Exposition closes.

(Continued on page 25.)

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

Ice Cream Representation at Syracuse

A Brief Treatise on Some of the Reasons Why Ice Cream Manufacturers
Are Going to the National Dairy Exposition
By FRED E. ERIKSEN

WITH the approach of the seventeenth annual National Dairy Exposition at Syracuse, N. Y., October 5 to 13 inclusive, it is gratifying to note the genuine interest already manifested by all branches of the dairy industry. This manifestation states clearly that the industry recognizes the importance of the basic idea back of the National Dairy Association's activities.

Contrary to the opinion of those, who fail fully to understand the intimate and vital relationship existing between the dairy industry as a whole and the ice cream industry, all indications point to a very representative attendance at the National Dairy Exposition. It is only natural.

Unminded leaders in the ice cream industry, men without insight and sound business judgment know only that permanent and assured success in their industry is directly and indirectly dependent upon the success of the dairy industry itself. These men are going to the National Dairy Exposition this year (as in the past,) for they believe this all-comprehensive exposition brings them in closer contact with, and affords more concrete visualization of the phases of the dairy industry which have an important bearing upon their own business.

An ice cream manufacturer obtains at the dairy exposition first hand information pertaining to the economical and efficient production of the chief ingredient of the product he manufactures and sells. Such information is exceedingly valuable to him in the management of his business and proves especially helpful in his relations with his farmer patrons.

* * *

To illustrate further, let me relate an experience I had several years ago. In one of the poorer dairy sections of the United States, I attended an ice cream manufacturers' convention. Preceding one of the afternoon sessions, a struggling but ambitious agent had driven me about the neighboring country among farmers from whom these ice cream manufacturers would presumably secure their raw material. I found twenty-eight country schools closed because the "low-salaried" teachers were not available. I saw wretched dairy farming conditions—scrubby, insanitary barns, no silos and inadequate facilities in every hand. There was a pitiable attempt at

the convention, as conventions go, was good. The marketing, plant management and merchandising aspects discussed at the convention were ably handled by the speakers. It was a "rousing" good convention. But when the agricultural agent modestly "spoke his message" that afternoon and pleaded on the behalf of these ice cream manufacturers becoming concerned about the farming conditions existing in the midst, his plea received no responsive recognition. The ice cream men at the convention appeared to be wholly unaware of the important fact that they must take a part in furthering the cause of the dairy industry in their own locality. They didn't have the dairy idea. Apparently, they failed to recognize these distressing farm conditions seriously affected the dairy industry. That there was anything they should do to alleviate these conditions did not occur to them.

Obviously enough, these same manufacturers were not going on neighboring and distant states as their

source of raw cream supply and complaining about it. Still, right at their very door lay a potential field, awaiting only the encouragement and guidance for development such as naturally follows when men are imbued with the dairy idea and purpose.

I use this rather homely illustration to emphasize the fact that no one branch of the dairy industry can afford to disregard or ignore the basic principles underlying the dairy industry. For any one branch to disassociate itself from the activities and efforts of the "mother" industry is fatal.

* * *

THE progress of the dairy industry is always reflected in every branch of the industry. All branches progress as the dairy industry progresses. No one branch is so entirely independent of the whole industry that it can hope to succeed alone. Nor can it shirk its responsibility in sharing with the other branches the onslaughts of the dairy industry's enemies. Poor farms; scrub cows, inadequate facilities, discontented dairy farmers, adverse dairy legislation, closed country schools, etc., do concern milk plant operators, ice cream manufacturers, creamery and cheese factory operators as well as farmers.

To best meet these onslaughts, to present a united front and to better understand and more quickly recognize its "subtle enemies," the dairy industry works as one great family, including all the branches and directing its activities impartially. The National Dairy Association is this family. Its annual exposition is a great inspiring visualization of the progress made. It is all-comprehensive.

* * *

YES, indeed! Ice cream manufacturers are coming to Syracuse to witness the exposition and to be a part of it. They appreciate its importance and the necessity of their presence. As a part of the dairy industry they, too, want to keep in close contact with the activities of the National Dairy Association, feel the pulse of the dairy industry, note its progress and lend their support in its struggles—always ready to join with the other branches to uphold and further strengthen the underlying principles of the dairy industry. This they can do best in co-operation with the entire dairy industry.

There is, of course, an added attraction this year in that sessions of the World's Dairy Congress will be held at the dairy exposition. Also, that delegates from thirty or more foreign countries will participate in the opening of the exposition on the morning of October 5. These sessions, the important meetings that will follow and the presence of the distinguished "dairy delegates" from across the sea will afford additional inspiration which leaders in the ice cream industry surely do not intend to miss.

From north, south, east and west, from Canada and other foreign countries come reports foretelling a record breaking attendance at the National Dairy Exposition. It will be a stupendous affair—a great gathering of all dairy interests; an event amazing in its comprehensiveness, covering every phase of the dairy industry and correlating all its activities for the general profit and benefit of everyone.

Yes, ice cream manufacturers are coming to Syracuse.

PROSPERITY FOLLOWS THE DAIRY COW. Be sure you attend the National Dairy Exposition—Syracuse, N. Y., Oct. 5-13.

The Newest Plant in the Northwest

The Ives Ice Cream Company Celebrates Its Forty-fifth Birthday
by Opening Handsome New Plant

THE new plant of the Ives Ice Cream Company at Second Avenue and University, S. E., Minneapolis, Minn., ranks as one of the finest and most completely equipped ice cream plants in America. When one considers the enormous strides that have been made in the last few years in this industry and the excellent plants that have sprung up almost over night in nearly every city, the distinction of possessing one of the finest is something to be proud of.

The new plant, which shortly will be opened for public inspection, has another unique distinction. It typifies the growth of a fine, substantial business commenced by the present owner, A. H. Ives, forty-five years ago in Minneapolis and carried on through all the passing years under the same management.

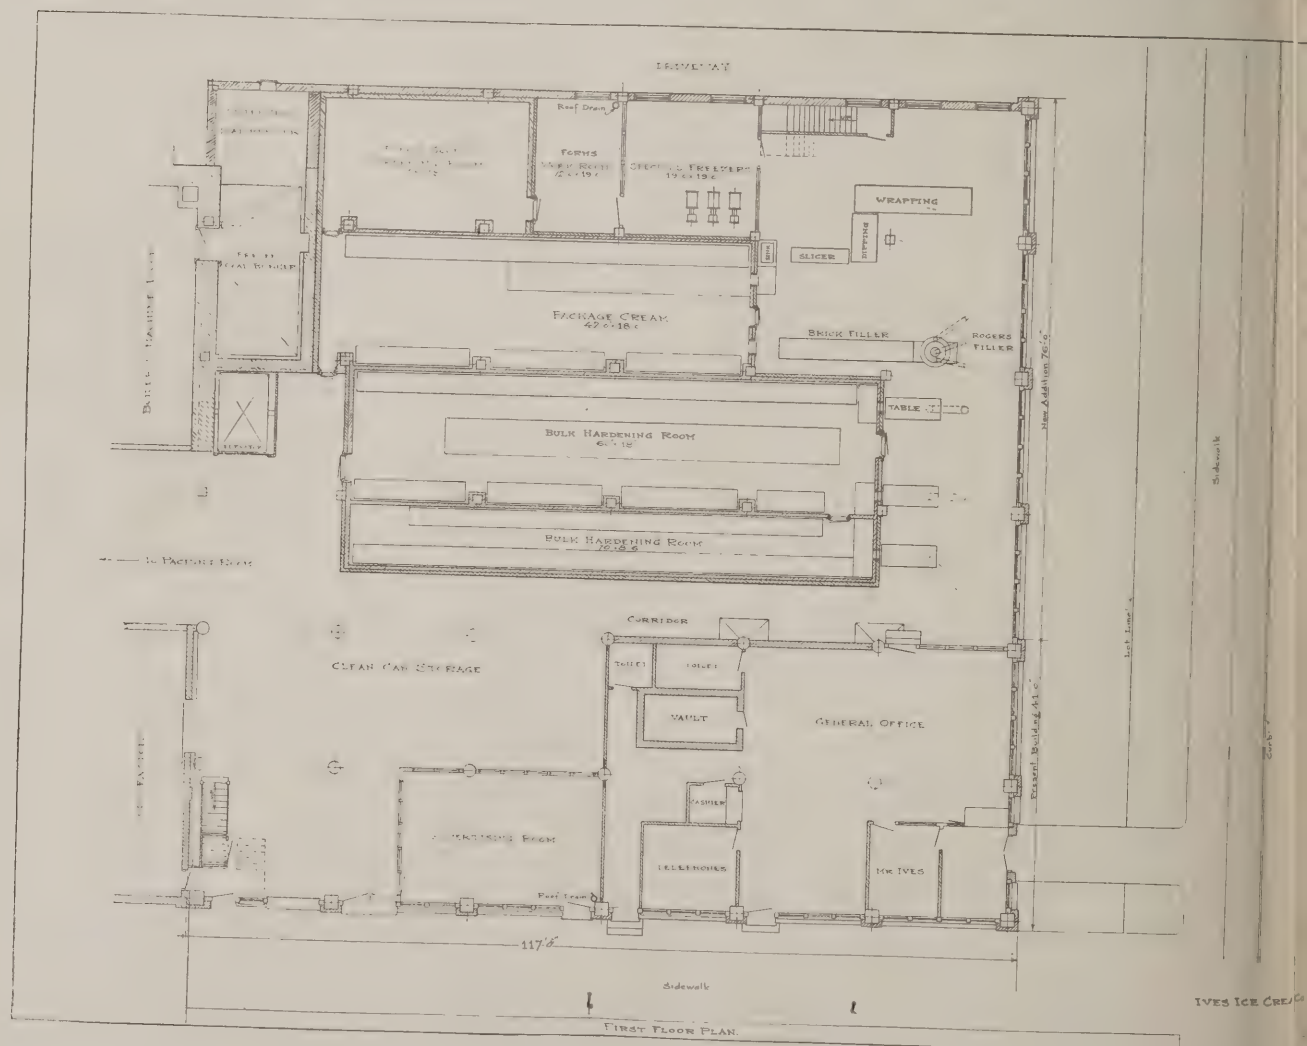

Forty-five years ago the business was commenced in one little storeroom at 219 Central Avenue, shown in the picture on the next page; today it occupies almost an entire city block. Two men and a boy did all the work there was to be done, while today, during the summer season, the Ives' payroll includes more than 150 people. One little forty-quart hand-power freezer

used to turn out all the ice cream that was needed frequently it was idle for lack of a market. The plant six eighty-quart and six forty-quart freezers running practically constantly at full speed. The capacity of the plant is a million and a half each year.

Today eighteen automobile trucks and eleven horse wagons are required to supply the hundreds of dealers who serve ice cream in every block of Minneapolis and the great shipping business which the company enjoys.

To grow from a one-horse plant into one of the great establishments of the country; to continuously increase a property from small beginnings to great proportions and to retain the friendship and confidence of thousands of dealers through all the passing years is a great accomplishment. And A. H. Ives, the man who originated with him, and the big family of employees proud of the accomplishment.

The first power plant was a horse power tank and later a one-horse winch was added, but it

Dairy Industry

Perry Building PHILADELPHIA

these being very successful, a four horse-power steam engine was installed. One small horse drawn wagon delivered all the ice cream the company made and without much difficulty it covered the whole city of Minneapolis and its suburbs. Today Ives wagons are on every street and the huge trucks that carry the favorite dessert to hundreds of dealers are common city sights.

In 1883 the company was moved to 621 Nicollet Avenue, but after a year this location was considered too far out of town and another move to 244 Hennepin Avenue, then next to the post office, was made. When this location and plant became too small, another shift was made to 425 Jefferson Street and in the transit, a candy business that had been an adjunct to the ice cream business was dropped. About this time another freezer and another horse and wagon came into action and the company was then fully launched.

In 1898 property at 215 Second Avenue, S. E., was secured and what then seemed quite a pretentious building, 60 x 65 feet, was erected; although the first floor of this structure was sufficient to handle all the busi-

ness. From that start in the city, the business has grown the present plant, and a comparison of the present plant with such comparison were possible would reflect the wonderful growth of the ice cream business not only in Minneapolis but in all America.

The exterior of the new plant is of tapestry brick and it is so built back far enough from the street to accentuate the clean, industrial character of its architecture. The tiled walls are used in all the manufacturing and processing departments and the floors throughout are of Terazza marble. The woodwork everywhere is covered with white enamel and the scrupulous cleanliness of the entire plant will be both a joy and revelation to the careful housewife.

One unique feature of this plant, not often found in other ice cream plants, is a splendid cafeteria dining room for employees with a capacity for seating eighty people. Attractively furnished with white enameled tables and comfortable chairs, it invites the employees to a well-equipped kitchen adjacent to the dining room. The kitchen supplies excellent meals. On the same floor and immediately adjacent to the dining room is a

BLACK WALNUT ICE CREAM

AS YOUR 1923-1924
FALL and WINTER SPECIALTY

Summer fresh-fruit creams are out of season now but BLACK WALNUT ICE CREAM is just coming into its season of most hearty demand, because black walnuts are a winter delicacy.

In summer time people prefer light creams—but for fall and winter they want heavy bodied creams and BLACK WALNUT ICE CREAM ranks high in that class.

HE HAS HIS ROOM ALREADY.

C. J. Alfred, president of the California and Southwestern States Ice Cream Manufacturers' Association and of the Alfred Pure Ice Cream Company, Inc., Los Angeles, Cal., recently wrote to The Association of Ice Cream Supply Men, "I did not attend the convention last year but received so many glowing reports of the benefits received from ice cream manufacturers that when it was my privilege to vote for Cleveland I immediately engaged rooms for Mrs. Alfred and myself one day ahead of the convention date, as I do not propose to be hurried and will take plenty of time to see what the supply men have to offer."

NEW ICE CREAM LAW IN MICHIGAN.

Strict enforcement of the Michigan new state laws regulating the manufacture of ice cream and prohibiting the manufacture or sale of filled milk will be undertaken, it was announced recently by the dairying division of the state department of agriculture. The laws became effective Aug. 29. Rules and regulations have been prepared.

It is estimated that the ice cream law will compel more than 50 manufacturers to remodel their plants. The department will rule that ice cream cannot be manufactured in dark or poorly ventilated basements.

The filled milk bill which was enacted by the legislature at the request of farmer and dairying organizations, prohibits the manufacture or sale of any milk product containing cocoanut or other foreign oils or substitutes for butterfat.

HYDROX CORPORATION EARNINGS SHOW GAIN.

Earnings of the Hydrox Corporation, one of the country's largest manufacturers of ice cream, with headquarters in Chicago, were 20 per cent above the same month in 1922, according to an official statement. July earnings, based on information to date, will reflect an equally good increase.

PLANS SHAPE UP FOR NATIONAL ICE CREAM EXPOSITION.

(Continued from page 8)

All those intimately acquainted with the preparations being made for the convention-and-exposition and with the interest in the combined event that exists throughout the industry are convinced that 4,000 persons will register at the show or attend the convention, most of the 4,000 doing both.

The Association of Ice Cream Supply Men this year, it is to be noted, will hold a convention of its own organization in addition to the Second National Exposition. Its convention sessions will be held in the Public Hall, the exposition building, on Saturday, October 27.

Entertainment to equal or excel that enjoyed by the 3,100 persons in attendance at the 1922 convention-and-exposition is already arranged for, due to the efforts of The Association of Ice Cream Supply Men.

You'll make better ice cream if you get "The Ice Cream Review."

Stage is Set for Great Dairy Classic

Floodgates of International Dairydom Will Open Upon Syracuse October 5-13.

Dairy Show to be Grand Climax to World's Dairy Congress.

"GATES AJAR." The ticket-taker will be on the job.

THE eyes of the entire dairy industry are turned upon Syracuse and the National Dairy Show to be held there October 5 to 13.

Everything is in readiness for what is expected to be the greatest dairy classic in the history of the industry in this country. Men of all branches of the dairy industry will attend, in addition to men high in the nation's political and financial circles—governors, cabinet members, United States senators, and hosts of state officials. American science will be well represented.

The magnitude of the 1923 National Dairy Exposition is shown as the details of the Exposition have taken definite form. An attendance of between 200,000 and 300,000 is expected. Fifty thousand dollars will be awarded in cash prizes by many co-operative organizations. The show itself will cost approximately \$200,000, while the value of exhibits will be more than \$2,000,000. Many different dairy associations will make this the occasion of their annual conventions, including the International Association of Milk Dealers and the National Cheese Association.

In spite of the great attendance expected, William M. Rider, secretary of the Syracuse Dairy Show Committee, says ample accommodations are available. Hundreds of rooms already have been reserved by the Syracuse Chamber of Commerce.

The National Dairy Exposition will be the grand finale to the most stupendous undertaking ever attempted by the American Dairy Industry. Its success will mark the realization of the great dream of H. E. Van Norman, president of the World's Dairy Congress,

and other prominent men to assemble in this country the great dairy dairy leaders of all nations for the interchange of ambitious ideas for the promotion of dairying along the most scientific lines. The international aspect has served to heighten the color of interest felt in the occasion by dairy interests of America, and

there is every reason to believe that the floodgates of American dairydom will be opened upon Syracuse even before the official opening of the Exposition on October 5. The show will continue through October 13.

The World's Dairy Congress opens at Washington October 2, where dairy leaders of this and other countries will be in conference for two days, a program of the greatest importance to the future of dairying to be carried out.

It is announced from World's Dairy Congress headquarters that from two to thirty delegates from twenty different countries have accepted invitations to attend the Congress. At this meeting, the first international dairy gathering to be held in nine years, will be assembled delegates from South Africa, China, Japan, Argentine, Brazil, Uruguay, France, Switzerland, Sweden, Norway, Den-

mark, Italy, Canada, England and New Zealand.

All phases of dairying, including the educational, scientific, business and regulatory side as well as the importance of milk to health, will be discussed from an international standpoint at the meeting. "An after-way realization of the importance of dairy products in world trade, a new understanding of the vital influence of milk on child health and the vigor of nations, and the

(Continued on page 128)

Ice Cream Industry to Be Represented at World's Dairy Congress

Charles G. Morris, president of the National Association of Ice Cream Manufacturers, has appointed the members of the association's executive committee delegates to the World's Dairy Congress to represent the ice cream industry.

The personnel of the committee is: Edward B. Lewis, New York; William F. Luick, Milwaukee; F. N. Martin, Spokane; S. T. Bivling, Rochester; B. C. Sutton, Buffalo; W. M. B. Sine, Clarksburg, W. Va.; and the president and the secretary, N. Loewenstein, as ex-officio members.

The World's Dairy Congress promises to be one of the most stupendous affairs in the history of the American dairy industry, and may prove to be the greatest gathering of dairy interests ever held in any country, according to officials of the congress.

The dairy show is the feature appealing to the ice cream manufacturer. Interest in the National Dairy Exposition has been growing in the ice cream industry from year to year, and it is believed that the Syracuse show will find the industry well represented.

A program of especial interest to ice cream manufacturers has been prepared for the gathering at Syracuse.

History of the National Dairy Show

Time and Place of Holding Each Show, together with Brief Notes Concerning its Development.

Letters From the Men Who Have Sacrificed Time and Money to Make a Vision Come True.

[BY THE EDITOR]

We take great pleasure in presenting herewith certain facts relative to the progress and development of the National Dairy Show which we trust our readers will enjoy. The time and place of holding each show, along with certain other data, will undoubtedly prompt many of our readers to preserve these pages for future reference. Anyone who has attempted to collect such information will appreciate the time and effort involved. Obviously, we have not been able to get all the interesting details of each show. We have collected enough, however, to indicate the result of each show and to record its steady development. Much of the information contained in this article we have been able to glean from our files and from memory, the writer having attended all the shows. Certain facts, however, and very vital to the accuracy of this write-up, came from the files of Hoard's Dairyman, Fort Atkinson, Wis. On the invitation of Editor Glover we spent several hours in his office going thru the files and collecting such data as was lacking. We are glad to acknowledge his kindness and co-operation. Considerable difference of opinion exists relative to the origin of the dairy show idea. We have never attached very much importance to that phase of the question. There is plenty of credit to go round and there are bigger problems to be considered. We are interested only in presenting facts in this article, not in controversies. Here are the facts as we understand them:

1906 The First National Dairy and Pure Food show was held in the Coliseum, Chicago, Feb. 15-25, 1906.

Mr. E. Sudendorf, known to his multitude of friends the country over as "Sudy," was secretary and general manager. J. A. Walker, vice-president and general manager of the Blue Valley Creamery Company, put up \$10,000 in cash to guarantee the financial success of the show. The show paid its way and Mr. Walker got his money back.

The annual convention of the National Creamery Buttermakers' Association was held at the same time and place and liberal premiums paid in the scoring contest. Minnesota buttermakers sent the largest number of entries and won the silk banner.

A. J. Glover was superintendent of the dairy cattle exhibit and wrote the rules governing entries and awards, most of which are still in effect. Eighty-five head of dairy cattle were entered and \$2,824.91 was paid out in premiums.

A total of \$18,677.55 worth of floor space was sold and gate receipts amounted to \$8,337.25.

These figures are interesting when compared with present receipts and disbursements.

The U. S. Dairy Division co-operated with the dairy show management right from the start, a co-operation which has continued and which has become more valuable each year as government appropriations have been made more liberal. A milk and cream contest

was held and was in charge of the division.

A Milk Maid Contest was a feature of the show and created considerable interest.

Much of the floor space was sold to concerns dealing in standard food articles, not necessarily allied with the dairy business. This undoubtedly insured the financial success of the show but detracted from the "dairy atmosphere" which has characterized succeeding shows.

* * *

1907 The Second National Dairy Show was held in Dexter Pavillion, Union Stockyards, Chicago, Oct. 10-19, 1907.

Prior to the holding of the show the National Dairy Show Association was incorporated under the state laws of Illinois, with an authorized capital stock of \$10,000, divided into shares of \$100 each. We recall buying one of those shares at the earnest solicitation of "Sudy," paying him on the installment plan.

The following circular letter sent out at that time, not only contains many facts of historical interest, but splendidly illustrates the unsettled policy of the men who were groping about for means and methods for accomplishing a big work.

It is certainly complimentary to the men who were back of this movement to compare their objects and aims, as expressed in their letter, with the present policy of the show. Surely they had a vision. The letter follows:

What does the National Dairy Exposition mean to the Dairy Industry?

YEAR after year that question is being answered more fully. As dairy shows come and go they take on a deeper significance. The National Dairy Exposition has been graduated from the point of being good-naturedly accepted as an event to be tolerated because of its social, good-fellowship features.

Sociability and good fellowship are important, but members of the industry are beginning to realize that where there is no vision neither people nor industry can survive. The dairy show enlarges vision.

Dairying is going forward under full speed because of fuller understanding of this industry's possibilities. Inspiration is the compelling urge. It is an inspiration that comes of a larger vision of things to be accomplished and the means of accomplishing them. It is an inspiration which lifts producers, operators and supplymen from the hum-drum, every-day tasks and animates them with an overwhelming feeling that the dawn of a day of real, worth-while triumphs for dairying is just at hand.

Men engaged in the dairy industry merely as a way to make a living, going through their daily work in a matter-of-fact sort of way, begin to get a real vision of the industry's magnitude and future possibilities for growth when they look at the National Dairy Exposition.

By taking a full view of the dairy scheme such as the dairy show affords we can get a clear picture of the complete dairy cycle. A man peers from his own windows and his eyes roam over an expanse of ground to where the horizon falls. To the man who stays not far from these windows a great part of his time, it seems that his eyes take in a broad sweep of things. Yet, comparatively speaking, he has seen no more than an ant crawling over the surface of an apple. The most of the great, wide, wonderful world stretches out beyond his vision, far over the rim where his vision stops.

In the dairy industry we see just our small part of the scheme. Just over the horizon the rest of the cycle stretches out beyond our ordinary vision. We can only see the other phases of the industry at the points where they touch our daily lives. The dairy show impresses us with how little is the progress we have made compared with what we can make.

It would be difficult to measure the full value of such a show. It brings the different branches of the industry together to get a full view of the industry. It gives the members of the different branches a better understanding of their importance in the work of building for a bigger industry.

It gives dairying a new meaning to the farmer. It gives him a new vision and a new faith. It makes more firm the industry's foundation. It takes us over the horizon of our every-day lives and unfolds the wonder and splendor of the great, wide fields that otherwise we would know so little about.

It gives to all of us a broader understanding of the part dairying plays in national prosperity and human satisfaction.

It inspires greater and more intelligent effort. The National Dairy Exposition is important not so much because it shows us what has BEEN done but because of the realization it creates of how much more there is we CAN do.

PROSPERITY FOLLOWS THE DAIRY COW. Be sure you attend the National Dairy Exposition—Syracuse, N. Y., Oct. 5-13.

Office of
NATIONAL DAIRY SHOW ASSOCIATION
(Incorporated)
154 Lake Street
Chicago, Ill., Jan. 31, 1907.

Dear Sir:

The National Dairy and Pure Food Show, which was held in Chicago last February, met with such hearty approval and was such a splendid object lesson to both producer and consumer and was so successful financially, as to suggest the practicability and wisdom of holding a somewhat similar exhibition, but of an international character, annually. That show was largely an experiment and was made possible only by the liberality and faith of one man, who became personally responsible for its financial obligations. Fortunately, the result justified his faith, for after all the liberal premiums and large expenses were paid, there remained a modest surplus, and it is stated that he is quite willing to finance further National or International Dairy Shows.

It has, however, been deemed a wiser plan, by the officers of that show and Ex-Gov. W. D. Hoard and the representatives of the different breed associations and others whom they have consulted, to eliminate the personal element from the management and responsibility of undertaking an exhibition of such magnitude, and in its stead organize a corporation with a limited capital of say \$10,000.00, divided into one hundred shares of \$100.00 each.

In order to interest a large number of dairymen, both in the United States and Canada in the development of a permanent International Dairy Show, it is proposed to offer the leading ones interested in the dairy industry of the two countries a financial interest in this organization. The shares are not offered with the object of simply raising money, but to enlist as many as possible, who are willing to give some time and support to such an enterprise.

There are obvious reasons why one man should not be depended upon to furnish capital when so many persons have an active interest. In the first place, the show is not apt to become a permanent institution, where one man is the only banker; second, those that are not wholly familiar with the object of such an institution are apt to feel that money is the chief motive and as a result will not give it their heartiest support. There are a number of people who see great opportunities for making money out of such an exhibition and are willing to buy all the shares, but such a condition we wish to avoid. We want men interested in the general welfare of dairying to financially support this organization, and this is why we offer to you an opportunity to buy one share. We feel that good dividends can be paid on the investment and large premiums offered on cattle, butter, cheese, milk and dairy exhibits. And furthermore, a good educational program can be carried on each day. While the object of this International Dairy Show is to better the dairy conditions of America and unite all the different interests for one common purpose, yet it must make some money if such an institution is to live and be developed into a strong and useful organization.

The International Fat Stock Show has been of great benefit to the live stock interests of the country. A dairy show organized on similar lines will be of equal benefit to the dairy interests. It is of the greatest possible importance to the producers and manufacturers of dairy products that the consuming public become better acquainted with the source of supply and improved methods of handling the material that so largely enter into their daily food; and be impressed with the fact that dairy products stand foremost in cleanliness of production and value as food products. We have, at the present time, counterfeits that are taking the place of honest cow products, because the consumers do not appreciate the difference between the genuine and the substitute.

Not only will an International Dairy Show be helpful in educating the consumer, but it will be the means of uniting more closely the dairy farmer, butter and cheesemaker; it will create a better understanding between them; it will bring together the manufacturers of dairy machinery, commission merchants, manufacturers of dairy products, breeders and dairymen, thus creating a better understanding of one another's needs and the absolute dependability of one on the other; it will help to create a keener desire for better live-stock, better methods and better products, and it will give splendid opportunity for discussing and acting upon dairy questions of international importance. It is impossible to give, in a letter of reasonable length, all the benefits that can be derived from an International Dairy Show, but in this brief outline enough, undoubtedly, has been said to give you an understanding of the object and purpose of an organization of this kind.

If you, after careful consideration, feel inclined to give

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

this association your financial support, as well as otherwise, it is desirable that you send in your subscription at once, for it is imperative that the organization be formed and its officers elected with the least possible delay.

Yours truly,

E. SUDENDORF, Secretary.

Five hundred and three head of dairy cattle were on exhibition at this show, compared with 85 head at the first show. This fact illustrates the response by the cattle breeders of the country and indicates a support which has never waned.

"Sudy" was general manager and A. J. Glover was superintendent. Floor space to the extent of \$17,036.87 was sold and gate receipts amounted to \$6,052.55. The show closed with a deficit of \$3,762.17.

A comparison of the total amounts of floor space sold for the first two shows illustrate the way the dairy machinery and supply firms took hold the second year. Practically as much floor space was sold as at the first show in spite of the fact that the food exhibits, which predominated at the first show, were omitted. This splendid response by the machinery and supply firms has been the feature of all succeeding shows, thus furnishing a large part of the "sinews of war" to make the growth and progress of the show possible.

In spite of the financial deficit the success of the second show convinced the men who were promoting it that the industry needed and would ultimately appreciate such an institution. They were further convinced that it was founded on the right basis and should be continued in the future as a purely dairy show and not linked up with any other interests.

It should be stated in this connection that, while the capital stock was sold to individuals who might reasonably have expected cash dividends, it was never the intention of the promoters to make the dairy show a money making institution. The purpose has always been to promote the dairy industry by educational means. The wisdom of such a course was in later years vindicated when a re-organization made the National Dairy Association a membership, non-dividend organization. This is the plan on which it is now operating, a life membership costing \$50.

* * *

1908 The Third National Dairy Show was held in the Coliseum, Chicago, December 2-10, 1908.

Just to give our readers an idea of the business organization of the show at that early date we publish below the names of the officers and directors elected at the annual meeting of the National Dairy Show Association held in the Briggs House, Chicago, on March 4th, 1908:

President—H. B. Gurler, De Kalb, Illinois.

Vice-President—H. E. Van Norman, State College, Pennsylvania.

Secretary—E. Sudendorf, Clinton, Illinois.

Treasurer—Granger Farwell, Chicago, Illinois.

Directors:

J. A. Walker, Chicago, Illinois.

W. B. Barney, Hampton, Iowa.

D. H. Jenkins, Indianapolis, Indiana.

John D. Nichols, Cleveland, Ohio.

W. E. James, Hinsdale, Illinois.

J. G. Hickock, Milwaukee, Wisconsin.

E. K. Slater, St. Paul, Minnesota.

Executive Committee:

J. A. Walker.

W. J. Gillette, Rosendale, Wisconsin.

Jos. Newman, Elgin, Illinois.

The executive committee elected A. J. Glover, Fort Atkinson, Wisconsin, manager of the show. Mr. Glover was superintendent of the dairy cattle department of

Character Cartons for Ice Cream

"A profitable buy" Stock-designed Character Cartons

Individual Slice Cartons

Many ice cream manufacturers are increasing their sales tremendously by the use of cartons containing one serving of ice cream. We believe you'll find it profitable to learn more about the sales possibilities and price of individual slice Character Cartons. Write us today?

PPRICE is only one-half of the yard stick of value. The other half is high quality. Good-looking stock-designed Character Cartons are a "yard-wide value."

Everything you could ask of a package you'll find embodied in Character Cartons—including durability, selling value, and superb finish at a price most reasonably low.

Character Cartons in stock designs are so skilfully imprinted with your name and brand that the carton appears as one made entirely for you. And to all intents and purposes it is your own carton—for the use of a certain design is restricted to one user in a territory. There is no overlapping.

The most convincing proof we can give you of the superiorities of Character Cartons is to send you samples of our work. Why not write for them? At a glance you'll appreciate the attention-compelling designs—the high quality stock—and the evidence of expert workmanship. The price will be pleasingly low whether you order 5,000 or 5,000,000 cartons. Sutherland Paper Co., Kalamazoo, Mich.

OUR ADVERTISERS ARE YOUR FRIENDS—BUY FROM THEM.

the first two shows and was particularly equipped to successfully manage the big exposition.

That his administration was eminently successful is indicated by the fact that many of the educational features initiated that year have been continued year after year.

Perhaps the most striking of these special features is the student's cattle judging contest which was started that year and which has enjoyed an increasing interest as the years go by.

Ed. H. Webster, chief of the U. S. dairy division at that time, extended unlimited co-operation, detailing B. H. Rawl, one of his subordinates, to take entire charge of the contest.

When Mr. Rawl later became chief of the division, succeeding Mr. Webster, he continued to take special interest in the student's judging contest at each show.

The Third Show marked a radical change in the cattle premium awards, over \$7,000 being appropriated for that purpose. At each succeeding show this amount was increased in order to attract America's finest herds to this big dairy classic. The directors of the show kept in mind at all times that the dairy cow is the foundation of the industry and that the show could never survive without the hearty support of the dairy cattle breeders.

* * *

1909 The Fourth National Dairy Show was held in the Auditorium in Milwaukee, on October 14-24, 1909.

This was the first show held outside of Chicago and was the first show, except the Dairy and Pure Food Show, to return a financial profit to the association. Professor H. E. Van Norman was secretary and general manager and Mr. J. D. Nichols of Cleveland, Ohio, was superintendent of the cattle exhibit.

Mr. Colon C. Lillie of Diamondale, Michigan, was president of the association that year and Mr. J. Gilbert Hickcox of Milwaukee, one of the directors, took a very active part, inasmuch as the show was being held in his "home town."

The new auditorium in Milwaukee was finished just in time to "house" the show and there were many obstacles to be overcome in making arrangements. A large exhibit of butter and cheese was attracted, but poor storage facilities in the auditorium made it difficult to properly handle the exhibits.

A cow demonstration herd in charge of Mr. Helmer Rabild of the U. S. Dairy Division, was a feature of the 1909 show. A model creamery and cheese factory was an added feature.

The success of the Milwaukee show led the business interests of the city to believe that they would get the next year's show. The directors decided that the best interests of the entire dairy industry would be served by going back to Chicago and this led to the formation of a new association in Wisconsin to hold a dairy show in Milwaukee. This was known as the International Dairy Show. But after holding shows in 1910-1911, the project was abandoned.

The writer is tempted to extend this story about the Milwaukee show considerably, but space will not permit. Intimate contact with all the details and troubles incident to putting on a big dairy show in a new town, and in a new building at a time when the dairy show was not appreciated as it is now, gave us an experience which we shall never forget.

* * *

1910 The Fifth National Dairy Show was held in the Coliseum in Chicago, Illinois, October 20-29, 1910.

Professor H. E. Van Norman was secretary and general manager, and the show was a splendid success in all departments except the treasury department.

The Chicago City Health Department co-operated with the management in putting on a baby feeding demonstration which attracted great interest. Dr. W. A. Evans was health commissioner of Chicago at the time and has always been a staunch supporter of the dairy industry.

Mrs. Ella Flagg Young, superintendent of the Chicago schools, assisted by students from different schools, put on a cooking demonstration emphasizing the value of dairy products in the culinary art.

The National Creamery Buttermakers Association again held its annual convention in connection with the show and large premiums were paid out in butter prizes.

One of the features which will long be remembered by the delegates to the National Creamery Buttermakers Convention was the banquet by the Chicago Butter and Egg Board. Thomas Gallagher, Edward McAdams, A. J. Strigel, Edward Rueb and W. J. Mitchell were in charge of this big function.

The International Milk Dealers Association held its convention at the show and Mr. B. D. White was secretary at that time.

A milking contest, open to men and women, and another contest open to boys and girls under sixteen years of age were two features that attracted much interest.

The show was a failure, financially. The sale of floor space was satisfactory, but the people of Chicago failed to appreciate the show and the receipts were very disappointing.

We shall always remember the directors' meeting which was held the last day of the show. The future looked black and that show would have been the last one had it not been for a few strong hearts. The man who made the first show possible again came forward and offered financial backing to assure the future. Folks outside of that particular directors' meeting never learned at the time that the National Dairy Show was so near "down and out."

* * *

1911 The Sixth National Dairy Show was held in Dexter Pavillion, Chicago Stock Yards, October 26-November 4, 1911.

Mr. A. O. Auten was general manager and over \$15,000 was paid out in cattle premiums.

The big feature of the 1911 show was the visit paid by President Taft, the administration thus giving its approval of the splendid work done by the U. S. Dairy Division at all the shows.

President Taft also gave a silver loving cup to the winner in the Students' Dairy Cattle Judging Contest. This cup was won by Mr. Russell Jensen of the South Dakota College.

The National Creamery Buttermakers' Association again held its annual convention in connection with the show and there were 653 entries of butter.

A special effort was made to attract a big exhibit of dairy butter and 104 entries came from all parts of the country. Milk and cream exhibits came from 16 different states and Canada.

The famous Jersey cow, Dolly Dimple, was on exhibit, and a cream cooling tank and cream house in actual operation was shown by a big creamery company.

Different days were set apart for the different breeds of cattle, a feature that has continued ever since.

An important stockholders' meeting preceeded the annual meeting in 1911 at which time the capital stock of the National Dairy Association was increased from

\$10,000 to \$25,000. This action was taken on January 16, 1911.

At the regular annual meeting of the stockholders held on March 1, 1911, the following directors were elected: J. D. Nichols, Cleveland, Ohio; H. E. Van Norman, State College, Pennsylvania; W. W. Marsh, Waterloo, Iowa; F. J. McNish, Chicago, Illinois; R. B. Swift, Libertyville, Illinois; J. B. Irwin, Minneapolis, Minnesota; Chas. L. Hill, Rosendale, Wisconsin; A. J. Glover, Ft. Atkinson, Wisconsin; Wm. Hill, Chicago, Illinois; W. B. Barney, Des Moines, Iowa; J. A. Walker, Chicago, Illinois and E. K. Slater, Chicago, Illinois.

At the directors' meeting, following the stockholders meeting, the following officers were elected: President, H. E. Van Norman; Vice-president, J. D. Nichols; Secretary, Wm. Hill; Treasurer, J. A. Walker.

1912 The Seventh National Dairy Show was held in Dexter Pavillion, Union Stockyards, Chicago, October 24-November 2, 1912.

The year 1912 might be termed the turning point in the fortunes of the National Dairy Show. Mr. W. E. Skinner was elected secretary and manager and he began his work under a fixed policy adopted by the board of directors that in the future the show would be an all year around proposition, the manager giving his entire time and effort to it.

The International Milk Dealers' Association held their annual meeting in connection with the show and Mr. Sam Dungan of Indianapolis, Indiana, was secretary and treasurer.

The National Poultry, Butter and Egg Association held its annual convention at Hotel Sherman, Chicago, on October 28, 29, 30, thus enabling delegates to take in the show as well as their trade convention.

A big milk bottling plant in actual operation was one of the big features of the 1912 show. A much larger exhibit of dairy machinery and of dairy cattle were pleasing to the dairy show management.

1913 The Eighth National Dairy Show was held in Dexter Pavillion, Union Stockyards, Chicago, October 23-November 1, 1913.

The big feature of the 1913 show was a round table discussion in which 28 dairy organizations were represented. This resulted in a new interest and a new determination on the part of the leaders to spread out and in the future make the dairy show still more nearly representative of the great dairy industry. It marked new records for interest in the special cattle days and judging contests of all kinds.

Special attention was given to the question of sanitation of equipment for the production and manufacture of dairy products. The Universities of Illinois and Iowa, through their Home Economics Departments, co-operated in this demonstration.

The National Creamery Buttermakers' Association again held its convention in connection with the show, but the attendance was so poor that a resolution was adopted to hold future meetings outside of the city of Chicago. J. J. Farrell was elected president and S. B. Shilling was elected secretary and treasurer of the association. Minnesota again won the silk banner.

The National Association of Ice Cream Manufacturers met at the dairy show and held their convention for the first time. Edward C. Sutton of Buffalo was president and Ross A. Woodhull of Chicago was secretary.

The National Dairy School Alumni was organized, with Thomas C. Halpin of Detroit, Michigan, as president and Martin H. Meyer, Madison, Wisconsin, as secretary and Alumni editor.

Keeping up Standards

THE GOLD STANDARD

With the mark, the ruble and the krone of Europe, contrast the American Dollar, and you will realize what it means to the world to have the Gold Standard maintained.

THE ICE CREAM STANDARD

Every ice-cream maker knows that VANILLA is the standard by which his product is judged. Don't let Bolshevik notions of cheapness lower your vanilla standard. Make your Vanilla Cream better, always a little better, and your entire product will feel the effect of your growing reputation.

THE VANILLA STANDARD

To make the people of your section say of you, "Yes, their ice cream is always the best," the one sure way is always to use

Michael's Mexican Vanilla Powder

Drop in at our Booth NO. 62, lower floor, at the Cleveland Convention next month, and let us show you how we keep up the standard of our Mexican Vanilla Powder, and boost the reputation of the ice-cream makers who use it.

HISTORY OF THE NATIONAL DAIRY SHOW.

(Continued from page 34)

The National Association of Creamery Owners and Managers was organized with Martin Seidel, Bay City, Michigan, president, Louis Neilsen, Galesburg, Illinois, vice-president and W. A. Schlosser, Plymouth, Indiana, as secretary.

The International Milk Dealers' Association held its annual convention at the show and held one of their most successful meetings.

The Students Judging Contest was in charge of Mr. Helmer Rabild of the U. S. Dairy Division, and the team of the University of Missouri won first prize.

The 1913 show attracted a better representation of the various branches of the industry than any of its predecessors.

* * *

1914 The Ninth National Dairy Show was held in Dexter Pavillion, Union Stockyards, Chicago, October 22-31, 1914. Mr. W. E. Skinner was secretary and general manager.

There was a better attendance of dairy farmers than ever before. State days were inaugurated and special excursions run from different sections of the country to Chicago.

The Agriculture Colleges of Pennsylvania, Ohio, Indiana, Illinois, Missouri, Wisconsin and Minnesota made exhibits. Visitors included delegates from Mexico, Canada, Jamaica, and British Columbia.

There were 699 head of dairy cattle on exhibit compared with 651 in 1913. 205 entries of butter made up the butter exhibit.

Ice cream making machinery was a special feature of the 1914 show.

Among the associations holding their annual conventions or important meetings at the show were the International Milk Dealers Association, The Association of Dairy and Milk Inspectors, National Association of Dairy Officials, The Congress of Marketing, directed by the Chief of Marketing of the U. S. Department of Agriculture, Official Dairy Instructors' Association, The American Dairy Farmers' Association, The National Association of Creamery Butter Manufacturers, The National Dairy Union, The National Association of Creamery Owners and Managers, The National Association of Ice Cream Manufacturers, The Milk Producers Association and the Cheesemakers' "round-up."

What happened at the close of the 1914 show might well be termed the "Tragedy of the National Dairy Show." Over \$2,000,000 worth of cattle were held in quarantine for over a month on account of the prevalence of the foot and mouth disease in the country. The experience that cattle raisers went through during that time will never be forgotten by those who had the experience.

* * *

1915 No National Dairy Show was held in 1915. The directors met in Chicago and decided that a recurrence of the foot and mouth disease made it unwise to hold a show.

* * *

1916 The Tenth National Dairy Show was held in Springfield, Massachusetts, on October 12-21, 1916.

This was the first invasion of the East by the National Dairy Show and all agree that it resulted in great good for the dairy industry of the New England states. The business men and statesmen of that section took hold of the proposition and co-operated with the dairy show management in a way never before enjoyed.

So much interest was aroused in the event that the

Eastern States Exposition was held the following year with abundant success.

More exhibit space was sold for the 1916 show six days prior to the opening of the show than was ever sold for any previous show. This illustrates the enthusiasm aroused.

A large exhibit of dairy cattle, consisting of 100 head, greeted visitors at the Springfield Show. The were wonderful displays of all kinds and the attendance exceeded all previous shows. The Treasury Department was jubilant over the general results.

Teams from 18 state colleges competed in the Student's Judging Contest and the team from the University of Nebraska, headed by Professor J. H. Frandsen won first place.

* * *

1917 The Eleventh National Dairy Show was held in Columbus, Ohio, October 18-27, 1917.

The success of the Springfield Show left the directors of the National Dairy Association to accept another invitation coming from east of Chicago.

The Columbus show would undoubtedly have been one of the most successful ever held had it not been for the inclement weather. It rained every day during the show and this along with low temperatures spoiled the attendance.

An idea of what the show might have been, from an attendance standpoint, may be gained from the fact that there were 70 more exhibits in place at the opening of the show than at any previous one. 26,000 more square feet of floor space was sold than ever before.

Columbus business men and publicity men did their part well and interest was aroused all over the state that undoubtedly would have resulted in a record attendance.

Exhibits by the U. S. Dairy Division and the Columbus Health Department are entitled to special mention.

The big horse show which was held in connection attracted over 300 entries and proved to be a pleasing innovation.

* * *

1918 The Twelfth National Dairy Show was held in Columbus, Ohio, October 10-19, 1918.

Columbus folks did so well in co-operating with the Dairy Show management at their first show that it was easy for them to get the return engagement.

They were due for another disappointment, however. The influenza epidemic prevalent all over the country kept people away from such gatherings and the attendance was very disappointing. War topics were uppermost in the minds of everybody and it was difficult to get down to business.

The record for exhibit space sold established at the previous show was exceeded at the 1918 show. More floor space was sold for exhibits than ever before. The exhibit of dairy cattle, however, was smaller, due to unsettled transportation conditions and the scarcity of labor.

History should record that Columbus made good both shows, but Fate was against her.

* * *

1919 The Thirteenth National Dairy Show was held in Dexter Pavillion, Union Stockyards, Chicago, October 6-12, 1919.

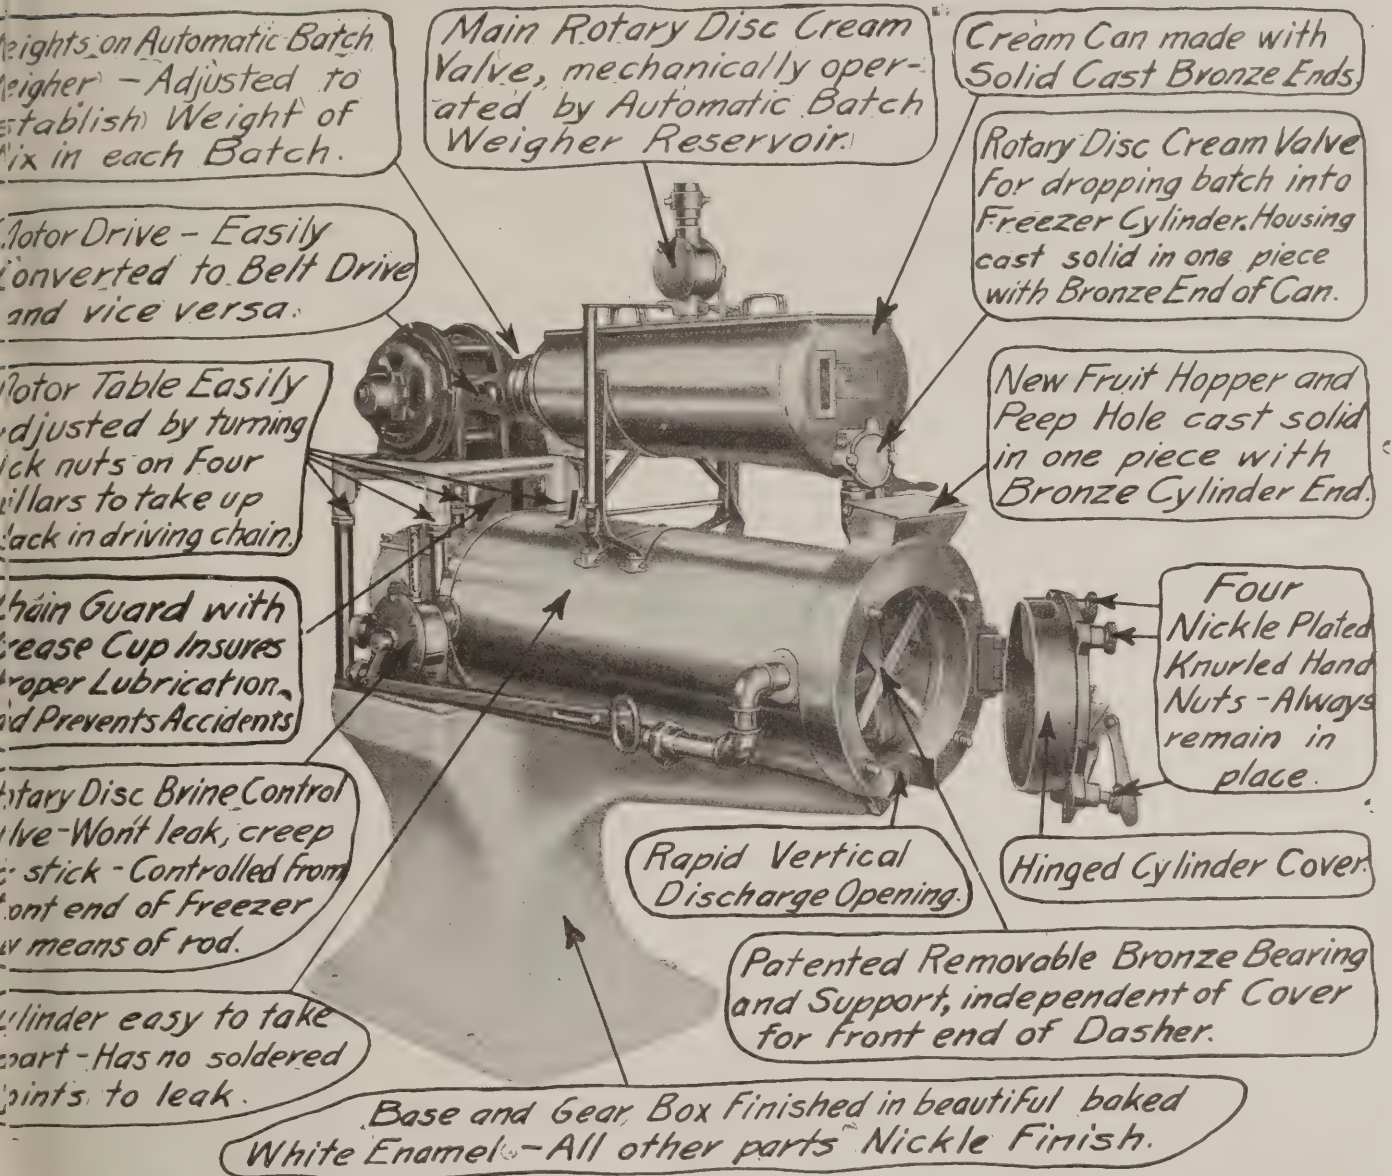

A big horse show held in connection with the dairy show was a big feature and attracted a splendid attendance of Chicago society folks at the evening performances.

Another big feature was the experimental creamery exhibit of Grove City, Pennsylvania, made by the U. S. Dairy Division. Demonstrations in infant's welfare work, weighing, measuring and scoring the babies was

undertaken on a large scale by Chicago welfare workers co-operating with the dairy show management.

The National Association of Ice Cream Manufacturers met in annual convention during the show, and also the International Milk Dealers Association, along with various other national organizations.

112 entries of market milk and 9 exhibits of certified milk established a new record for that department. An exhibit of Southern cheese by the U. S. Dairy Division was another unusual entry.

Special cattle sales were of special interest for the cattle breeders and attracted buyers from all sections of the country.

* * *

1920 The Fourteenth National Dairy Show was held at Dexter Pavillion, Union Stockyards, Chicago, October 7-16, 1920.

For the first time in the history of the show the sale of floor space exceeded 100,000 square feet. This had long been a goal in the eyes of the dairy show management and indicates the gradual and splendid development of that feature of the National Dairy Show.

Argentina and Denmark made exhibits at the 1920 show and there were many foreign visitors.

682 cattle were on exhibit and in the Dairy Cattle Judging Contest entered into by the teams from the different state colleges, Kansas won first place.

The National Association of Ice Cream Manufacturers and the International Milk Dealers Association held their annual conventions at the show.

The 1920 National Dairy Show went down in history as a success in every way except that folks didn't come to see it.

* * *

1921 The Fifteenth National Dairy Show was held on the State Fair Grounds, midway between St. Paul and Minneapolis, October 8-15, 1921.

The business men of St. Paul and Minneapolis have always recognized the importance of the dairy business to the welfare of the Northwest. They invited the Dairy Show to come to Minnesota and the invitation was accepted, resulting in one of the best shows ever held.

The attendance was good, not only from the twin cities, but from all sections of the Northwest. A beautiful new dairy cattle building, 200x300 feet in size was utilized for the exhibits of dairy machinery and supplies. Visitors were impressed, probably as never before, with the magnitude and importance of the dairy industry.

Many dairy organizations held their annual conventions at the show, among which may be mentioned the National Association of Ice Cream Manufacturers, the International Milk Dealers Association and the National Creamery Buttermakers' Association. These conventions were all successful, being held either at the show grounds or in one of the twin cities.

"The Dairy Cow A Market for Feed," was the central theme around which the U. S. Dairy Division built up a wonderful exhibit which attracted unusual interest. In the Cattle Judging Contest the team from the Kansas University again won first place.

The Horse Show was repeated and attracted considerable interest but was overshadowed by the show in the "big tent."

* * *

1922 The Sixteenth National Dairy Show was held on the State Fair Grounds, midway between St. Paul and Minneapolis, October 7-14, 1922.

The success of the 1921 show made it easy for the business interests of the Northwest to induce the directors of the National Dairy Show to select the same loca-

tion for 1922. A pledge of 50,000 paid admissions, along with assurances of their continued co-operation, made their appeal strongest among several invitations coming from different parts of the country.

The 1922 show was a repetition of the one held the year before so far as general interest and successful displays were concerned. It was a wonderful show among the many special features may be mentioned "Healthland," put on under the general direction of the National Dairy Council.

Ever since the organization of the National Dairy Council its exhibit has been a feature of the National Dairy Shows, but in 1922 the council established a record which the men back of it will find hard to ever duplicate.

"Healthland" attracted unusual attention, occupying an entire building and attracting especial attention of child welfare workers the country over.

The 1922 show is so fresh in the minds of the thousands who visited it that further comment seems unnecessary for the purpose for which this story is written.

We are leaving the remainder of the story to be told by some of the men who have "borne the brunt of the battle and heat of the day."

We asked these men to write us a special story that we might use over their signatures. Here are the replies:

* * *

FROM THE FIRST PRESIDENT.

We are indeed pleased to be able to present the likeness of Mr. H. B. Gurler, together with a special message from him. Mr. Gurler was for many years a dairyman near De Kalb, Illinois. He was known and loved by everybody in the dairy business who knew him.

It was but natural that he was chosen as the first president by the men who were interested in promoting the National Dairy Show. Mr. Gurler moved to Macon, Mississippi, several years ago where he has continued to spread the gospel of dairying. We are sure his many friends will be glad to read his message as follows:

"Your request for a message from me was a kindly act indeed. When a person reaches his 84th year he is inevitably among the have beens, but not necessarily past enjoying watching the development of interests that he had a hand in the organization of. I feel proud of the fact that I was one of the organizers of the National Dairy Show. I have always taken pride in the fact that the first move made toward securing the passage of the national oleomargarine law was a resolution I secured the passage of by the Illinois State Board of Agriculture when I was president of the State Dairy Association. Another fact that I have an old man's pride about is that I was the first to pay for milk at a creamery by the Babcock test.

"I was the pioneer producer of certified milk for the

* * *

FROM THE PRESIDENT.

A message from the president of the National Dairy Association, who is also president of the World's Dairy Congress, is particularly appropriate in this story. Here it is:

"Is any other industry made up of so many independent units as the great American dairy industry?

H. E. VAN NORMAN,
Washington, D. C.

President of the National Dairy Association for many years. Also President of the World's Dairy Congress. Manager of the National Dairy Show in 1909-1910.

It draws its raw materials from four and a half million farms. These pass through thousands of creameries, cheese factories, condensing factories, ice cream factories and great city pasteurization plants, preparatory to consumption. To these farms and factories must be added the great number of distributing agencies wholly or partially devoted to the handling of dairy products. Think of the investment in factories devoted to the manufacture of tools, equipment and supplies necessary for the preparation of these products for market.

"Changing from the material to the human, think of the dairy

professors, extension leaders, county agents, rural high school teachers and traveling salesmen, each of whom as an individual is vitally interested in the industry and yet whose activity influences the life and success of a large circle. Again think of the state and municipal officers aggressively concerned with dairy products whose activities vitally affect the profits of the industry. Last, though not least, consider the dairy publications which serve the industry in their tireless effort to present that which promotes prosperity.

"Is it any wonder that this vast group of individuals, isolated as so many are, have lacked appreciation of the power of numbers? The National Dairy Show, organized eighteen years ago, has been actuated by the desire to serve this army of people who make their living out of the dairy cow, her products or the businesses wholly dependent on her. It exists to serve this army by an annual visual presentation of the year's progress, to serve by the mutual unconscious exchange of ideas occurring in the annual meetings during show weeks, occurring in the personal conversations which often mean tens and hundreds of dollars of benefit resulting from a new idea picked up and adapted to a new activity.

"Has any industry more rapidly grown in an appreciation of its own importance of the relation of its own

constituent parts one to another and in appreciation of the inter-dependence of its parts. All realize that general prosperity is inseparably involved in the prosperity of each part. This recognition has brought about the wish to exchange ideas with leaders from other countries culminating in The World's Dairy Congress.

"With all due respect to past claims, I believe it can be conservatively said that this year's National Dairy Show, accompanied as it will be by the World's Dairy Congress, will bring together a greater number of influential men and women from more states in the Union, from more countries in the world, than any of its predecessors. No community can afford to fail to have a representative, or several representatives, to soak up all that is within his power and bring it back to his community as a contribution to its progress.

The Exposition has been made possible by the faith and unpaid service of a group of men whose interest in the industry is larger and broader and more far-sighted than their own immediate business interest. It has been made possible by the financial contributions of those who buy its floor space and its tickets. It has been made possible by the leadership of its management.

"Gratifying as is its progress to date, its future is big with possibilities if we will but benefit by the past and fear not to break new paths which serve the industry in new and as yet untried fields."

* * *

FROM THE CHIEF.

When we started out to get opinion of leading men relative to the National Dairy Show we didn't hesitate to bother big men, although we know they might be busy. We approached the Big Chief at Washington and he sent us a special message which we are sure you will enjoy reading. Here it is:

"The dairy business is an enormous and intricate industry. There are hundreds of different

agencies, classes of people, and organizations that have an interest in the production, distribution and consumption of dairy products. Each of these agencies has a part in the development and promotion of the industry, and unless there can be some sort of clearing house somewhere in the industry where these various interests can assemble, measure the progress of the year, and determine future developments, we can not have the greatest progress.

"The National Dairy Show, it seems to me, is and has been such a clearing house of the industry. It is not always easy for the individual to measure the benefit he derives from attendance at the show. Nevertheless one can not know the progress of the industry; he can not know its tendencies; he can not know the new lines of machinery that are coming forward; he can not know the trend of the types of animals that leading judges and

Help Your Dealers Sell More Cream— These Signs will do it!

Indoor Signs for Counter and Window Display

Here's another popular Sign—our indoor intermittent flash display.

Fitted with automatic thermo flasher. No mechanical apparatus or motor required. No attention necessary.

Put these signs in your retailer's windows. It increases cream sales—flashes a buying message to people right at the very time when they are at the store and can drop in and buy.

Ask for full details and prices. Sketches gladly submitted upon receipt of your trademark.

SPEED up the sales of your cream. Co-operate with your dealers. Flash the name of your brand on every street.

People act on impulse. A reminder impels them to buy. Remind the passing public of your cream. Put a striking, brilliant sign over each dealer's door. Let people know your brand of cream is on sale everywhere in your town.

Convex Electric Signs will do the trick. They are different. Face is all metal. Nothing to break. Current consumption practically nothing.

Brilliant colorings make Electric Convex Signs stand out bold and compelling during the day. Hundreds of patented perforations make words glisten like diamonds at night.

Put life, action and selling methods behind your cream. Help retailers sell more. Place Electric Convex Signs with every dealer in your town.

Write for prices on quantity lots. Send your trademark to us and we'll submit a sketch free. Address

The McSavaney Co.
Springfield, Ohio

phitheater at the stock yards, and with increased space and facilities it continued to grow.

"There were some disadvantages in having it at the stock yards, more particularly the fact that it was hard to get to and it was difficult to get the attendance from the city, that was very much desired, so it was decided to hold the show at different places.

"I believe the show should have a permanent home. The industry certainly justifies the erection of a monument in especially the way of a building, arranged and equipped for the purpose intended, looking to convenience, comfort and economy. I believe that the commercial feature of the show should be eliminated as far as possible and the one object should be to stimulate the industry by making it more profitable to the producer and rendering better service to the consumer." selecting; he can not know the new discoveries and new lines of educational work, without some such contact as is offered through the National Dairy Show. To the individual who is interested in the promotion and development of the industry, the things which he can see and hear at the show constitute a notable opportunity. His attendance and co-operation have further a valuable helpful effect upon the industry in general. In helping to solve the problems that confront the dairy world, and in carrying home with him the lessons presented at the show, he has an effect upon the whole industry that is hard to measure. The dairy show is a great educational institution, valuable from every angle of the industry, and the more generally these annual meetings are attended and participated in by people through the country, the greater and more rapid will be the progress of the industry along proper lines.

"Sometimes one class of people in the industry are dissatisfied because they are unfamiliar with the problems and difficulties of some other class. The producer has a concern in the part the distributor plays in the whole scheme of supplying the consumer. Likewise the distributor is interested in the problems of the producer. No group is independent of all the others. Knowledge and co-operation on the part of all is the surest way of solving the problems confronting this great industry.

The future success of the National Dairy Show, it seems to me, will be measured by the success of the management and the dairy people generally in the development of a show that will promote the industry

along the lines of greatest efficiency in production, the highest degree of sanitation, the finest quality of products, and the most efficient and satisfactory development of agencies for placing these superior products in the hands of consumers. How to increase the knowledge and intelligent use of milk and its products, and how to develop systems of dairy production that will insure better living on the farms of this country are items that will have a place in the big program of this National Dairy Show, if it is to accomplish its greatest good."

FROM THE MAN WHO MADE THE FIRST SHOW POSSIBLE.

The man who backed the dairy show with his money during its early history didn't hesitate a bit when we asked him to dictate something for this special effort. J. A. Walker is too well known to our readers to need any lengthy introduction. What he says is of more interest. Here it is:

"I am pleased to give my endorsement and express my faith in the National Dairy Show.

"As one who has been identified with it from the beginning I can testify to my belief that as an institution it has served the dairy industry well. I believe the mere fact that it is in existence today proves its value. I know that it has gone through many struggles, some of which at times seemed almost insurmountable, and when an institution survives such struggles and develops to such proportions as the dairy show has today, is proof positive of its value as an institution.

"The greatest service that I have seen rendered by the dairy show has been its influence in bringing together the varied branches of the industry.

"When the national dairy show was organized there was scarcely any personal acquaintance between those interested in the different branches of the industry, while today there is not only manifest a most splendid social contact, but an earnest patriotic feeling for the welfare, one for the other, in all branches of the industry and this bringing together spirit is of enormous value to the industry as a whole.

"The industry has grown and today needs a closer bringing together if all the benefits possible are to accrue to the industry. The industry itself has grown so great and so important, and along with it in the same proportion has grown the National Dairy Show, until likely right now there is needed a round table get-together of the entire industry along the lines of the Plan and Scope idea.

"It is altogether likely that the time has arrived when possibly the dairy show would function somewhat

Note the Many Superior
Features

They Never Shrink

1 Stay-on covers are treated before being cut which thoroughly shrinks the fabric so that all possible chance of shrinkage is eliminated. This is our own special process.

Covers are Furnished Complete

2 Strings are hard laid finish, and tipped at ends with metal tips. Copper rivets are inserted to give the cover strength, and extra patches placed where the wear is greatest. Covers are furnished with staples.

Attachments

3 Cover attaches to the tub with bronzed Dee and piece of rawhide, which will not rust as do the other attachments.

Experience

4 Stay-ons are made by experienced workmen in an up-to-date factory, and fully guaranteed by us.

Finish

5 This cover is not effected by weather conditions. It will be found always dry. Never can it freeze stiff in cold rooms nor will it soften and become oily in warm weather.

Large Cut

6 Stay-on covers are cut large to fit easily over the tub, and together with the bright finish on the goods makes an ideal top for your packer.

differently from what it does now. We have seen through the influence of the National Dairy Show the organization of the Dairy Council at Waterloo, which each year is proving a most wonderful success and as a consequence of holding two shows in St. Paul we now hear the good news that a local show in that section will be maintained annually hereafter. It is probable that more of this kind of work should actually be encouraged and assisted.

"The consumption of dairy products through the great work of the National Dairy Council is increasing constantly and greatly and we are going to need to produce more of these products and we want the farmers to produce them at a profit. The only way to do this is to encourage the use of pure bred sires and the whole industry should be organized if for no other reason or purpose than to get behind the breed associations and aid them in the distribution of pure bred dairy stock.

"The future of the dairy industry certainly looks bright and by capitalizing the spirit of oneness which the National Dairy Show has developed and taking advantage thereby in a concerted way of all of the possibilities, we will have done not only a good thing for ourselves but a good thing for agricultural America."

* * *

FROM THE BOSS HIMSELF.

Of course, a story of this kind would not be complete without a letter from the man who has been guiding the ship during the longer part of its voyage. The good ship "Dairy Show" is riding the waves of success and much credit goes to Secretary and General Manager

W. E. Skinner. Here is his message:

"The National Dairy Exposition of 1923 will be of more infinite value to America's dairy industry than any that has been held before, that is, if deductions from events upon which this statement is based are reasonably sure.

"It would seem that the interest manifested in the show and its work this year is as strong from one section of our country as another. From the Atlantic to the Pacific coast states, from Texas to the Canadian line, and then all through Canada do we find a keen interest in the Exposition

not only from the educational forces of all sections, but from the laymen of all branches of the industry, showing that a healthy interest is surely crystalizing with regard to the place the dairy cow must occupy in our agricultural program, and the place her products must occupy in the life of the child, which means the building of a sound, vigorous, healthy nation.

"The fundamental soundness of the teachings of this Exposition are reaching the souls and consciences of all men in any way engaged in the industry and all are striving to put more constructive thought and effort back of their special part. The show responds to the

general feeling of a worthwhile work to do for humanity and everybody is willing. The attendance this year will be 90 per cent dairymen from all parts of America.

"The cattle exhibit will be larger than it ever has been—pure bred, grades and calves in the boys' and girls' department—a record products entry—a record machinery and supply exhibit—more foreign exhibits—larger conventions—more interest in the show and better presentation of exhibits than ever before.

"All that is now necessary is for everyone to get in shape and we will launch the industry this year into the foremost position in agriculture, and into the minds and hearts of the people in its relation to human life and the stabilizing of all agricultural pursuits, upon which rests the progress of all industry."

* * *

FROM THE MAN WHO "STAGED" THE FIRST TWO SHOWS.

The question of who first thought of holding a national dairy show is of little consequence, as we look at it. Other folks perhaps thought the world was round, and that other lands laid toward the west, but Columbus had enough nerve and faith to go find them.

Here is a letter from the man who "went and done it," and started the National Dairy Show on its career. We asked "Sudy" to write us a special message and here it is:

"Answering your invitation to write something about the National Dairy Show, I will try to comply. While superintendent of the dairy exhibits at the St. Louis Exposition in 1904, I made up my mind that the dairy industry needed a national show where cattle, as well as dairy machinery and dairy products could be exhibited all under one roof. We already had an annual exhibition of machinery and supplies at the National Creamery Buttermakers' Convention, but it lacked the dairy cow.

"Not at that time having the necessary capital for such an enterprise, I tried to interest the supply houses, who were all willing to help by making exhibits and giving their moral support but not financial support. At that time I spoke to J. A. Walker about my plans, which he thought were good and he interested Huston Wyeth, president of the Blue Valley Creamery Company, who advanced the necessary capital.

"An organization was effected with Mr. Wyeth as president, Mr. Walker as vice-president and myself as secretary and general manager. We rented the Coliseum in Chicago, and in February, 1906, the first show was pulled off with the building filled with exhibits and, I believe, 306 head of dairy cattle.

"The show was held under the auspices of the National Creamery Buttermakers' Association, and they held

HISTORY OF DAIRY SHOW.

(Continued from page 44)

their convention in connection with the Dairy Show. The show organization furnished a premium fund of \$5,000. After paying all expenses there was left a profit of \$2,700.

"The writer also managed the second show at the stock yards in 1907, which lost several thousand dollars due to several causes, among them the panic which came right at the time of the show, and the torn up condition of the street car tracks on the south side of Chicago and the elevated not yet running to the stock yards. Many other things happened that hurt us which I will not here enumerate.

"My connection with the Association stopped in 1910. I am glad to know that many strong beneficial organizations were launched as the result of the dairy show. The work has my hearty support and I hope they will continue to help the industry in the future as in the past."

Answers to Inquiries

Dear Sir:—We are having a considerable number of complaints from various customers regarding the keeping quality of our product, and we are at a loss to determine the cause. Thinking you might be able to help us out, and that you would be kind enough to do so, we are giving you as much information as we can to aid you in determining the cause.

We send cream thirty and forty miles by truck besides doing a considerable express business. Our cream, upon leaving the plant, is good and hard and packed as well as we know how to pack it, but upon our truck's arriving at their destination, the cream has become soft and the retailer can not seem to bring it back to a hard condition. Our trucks leave the plant early in the morning and only consume about two and a half to three hours to make the trip. We use the extra high five-gallon tub, which, in our opinion, has enough room for plenty of ice.

Our mix contains 9 per cent fat, 11½ per cent S. N. F., 14 per cent sugar and a little less than .5 per cent gelatine. It is made up as follows:

Product	% Test	Lbs.	Fat	SNF	Sugar	Gel.	Total
Butter	83%	148.	122.8	122.8
S. Condensed	5%	190	.9	51.3	83.6	135.8
Milk Powder	1%	110.5	1.1	103.8	104.9
Sugar	105.4	105.4	105.4
Gelatine	4.2	4.2	4.2
Water	815.9
Total	84.5	1374.0	124.8	155.1	189.0	4.2	473.1

We have a Mojonnier tester and test each mix for fat and total solids and then standardize when necessary. We are using Atlantic Company's super X grade of gelatine, for which we pay 80 cents a pound. Our sweetened skim condensed milk we purchase from Libby, McNeil and Libby, and according to their analysis, it contains 44 per cent sugar and 27 per cent milk solids, or a total solid content of 71 per cent.

Reply: It appears from your letter that you only have difficulty with the cream you send out on trucks and by express. There is but just one thing wrong and that is that your cream is not properly packed for delivery. In other words, the proportion of ice and salt used in the packing with the cream is not correct. Otherwise it would not become soft in transit, especially during the short period of time it is in transit.

I suggest that the way to solve this difficulty would be to send a representative from your plant along with one of the trucks and actually determine whether or not the cream does become soft. Have him note whether a sufficient amount of ice and salt mixture is still in the packers when the cream is delivered to the retailer and then report back to the plant where the condition can be remedied very easily by using a larger amount of salt with the ice to assure the delivery of cream in a hard condition. I would also have this representative from the plant give the retailers proper instructions on how to pack cream in the fountain or cabinet. It is

very difficult for the retailer to reharden cream at the fountain after it has once become soft.

* * *

Dear Sir:—On account of the shortage of sweet cream, we are compelled to change our "ice cream mix," and use sweet butter instead of the cream. We would like a formula for 10 per cent fat mix, using whole milk, test 3.8, and 14 per cent sugar, condensed skim milk, 3 to 1, (we do not use the powder), sweet butter, etc., to make a 33 to 35 solids.

Reply: I am suggesting below in table one and table two, formulas for 10 per cent butterfat mixes made with sweet butter and milk and using skim condensed milk for serum solids.

Table 1.

100 pound mix, 10 per cent fat, 14 per cent sugar.			
Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar	13.30
.5 lbs. gelatine47
16.0 lbs. condensed skim milk	4.32	4.32
9.4 lbs. sweet butter	7.89	7.89
60.1 lbs. 3.8% milk	2.28	5.15	7.33
100.0 lbs.	10.17	9.47	33.31

Table 2.

14.0 lbs. sugar	13.30
.5 lbs. gelatine47
20.0 lbs. skim cond.	5.40	5.40
9.6 lbs. 84% butter	8.06	8.06
55.9 lbs. 3.8% milk	2.2	4.79	6.91
100.0 lbs.	10.18	10.19	34.14

Either one of these formulas should give you very good results and I suggest you try both of them and then select the one you like best.

* * *

Reply to C. J.: I am glad to give you the correct analysis of your ice cream mix, which you will find below in Table One. You were personally, quite correct in your figures when you calculated your total solids to be 34.11 per cent, providing you want to consider your sugar and gelatine 100 per cent solids.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
337.0 lbs. 4.4% milk	14.82	28.98	43.80
54.0 lbs. 84% butter	45.36	45.36
30.0 lbs. skim powder 95%	28.50	28.50
84.0 lbs. sugar 95%	79.80
3.0 lbs. gelatine 95%	2.85
92.0 lbs. water
600.0 lbs.	60.18	57.48	200.31
Per cent	10.03	9.58	33.38
Per cent sugar	14.00
Per cent sugar solids	13.30
Per cent filler	0.50
Per cent filler solids	0.47

REPLIES TO INQUIRIES.

(Continued from page 48)

I am returning your De Raef report sheet with pencil notations and you can easily see where Mr. — made his error. In the first place the per cent of butterfat is 10.03 instead of 10.30. Then the per cent of fillers is one half of 1 per cent instead of 3 per cent.

* * *

Dear Sir:—Please help me on my mix. As I read your work in The Ice Cream Review, and am deeply interested to know standing of our goods, and do not know how to figure same. We are using the following: 3 quarts of 40 per cent cream; 6 quarts of 8 per cent condensed milk, unsweetened; 6 quarts of 3½ per cent milk; 6 quarts of 9 per cent evaporated milk; 4 ounces good gelatine and 7½ pounds sugar to 10 gallon mix, the above to produce 40 quarts when frozen.

Can you tell me the solids, and butterfat, and what you think of the balance of the mix?

Reply: You will find below in Table One an analysis of your ice cream mix showing the amount of butterfat, milk serum solids and total solids. You will notice that your ice cream appears to test 9.6 per cent while you have about 11½ per cent serum solids.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
3 qts. or 6.0 lbs 40% cream..	2.40	.321	2.721
6 qts. or 13.5 lbs. 8% cond....	1.08	2.430	3.510
6 qts. or 12.9 lbs. 3.5% milk..	.45	1.110	1.560
6 qts. or 13.2 lbs. 9% evap. .	1.19	2.370	3.560
4 oz. or .25 lbs. gelatine....237
7.5 lbs. sugar....	7.120
53.35 lbs mix	5.12	6.231	18.708
Per cent	9.6	11.68	35.6

Due to a very good balance between fat and serum solids you should have no trouble in making a satisfactory ice cream from your formula. Your overrun will be practically about 90 per cent.

* * *

Dear Sir:—I have a Cherry, model E, brine ice cream freezer. My freezer pulley turns at 237 R. P. M. The factory recommends between 220 and 245. My pump is supposed to pump 27 gallons per minute. The factory recommends 30 gallon per minute. It was pumping more and I had to cut it down as my freezer pipes wouldn't carry the capacity. I freeze at a temperature of about 5 degrees above zero. My mix is as follows, and I mix each batch separate by hand. Ingredients, 7.0 pounds sugar; .25 pounds gumperts textor gum; 2.0 pounds skim milk powder; 37.80 pounds 20 per cent cream; 8.5 pounds 4 per cent milk and one-half teaspoonful salt.

Now, I am getting very fine ice cream, but don't seem to get my proper swell. My swell averages around ten gallons of finished ice cream from the described mix. My mix measures six and one-fourth gallons. If I understand right, I should get between 90 and 100 per cent swell, or between 12 and 12½ gallons of finished ice cream. My freezer is a Cherry, 40 quart. If my mix is too much, how will I reduce it to make my solids and butterfat come out right? The law here requires 14 per cent butterfat.

Reply: You stated that you were not getting the proper overrun. I have analyzed your mix given below in Table One where you will find that the ingredients are pretty nicely balanced and I see no reason why you should not get the overrun.

It is possible that you are over loading the freezer, putting too much mix into it for a single batch, so there is not enough room to produce the swell. I suggest that

you try using not over 50 pounds and possibly not over 48 pounds to a batch. It does not appear that there is anything wrong with the speed of your freezer and I see nothing wrong with the pumping of the brine nor the temperature of the brine.

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
7.0 lbs sugar	6.650
.25 lbs. gum237
2.0 lbs skim powder.....	1.90	1.90
37.8 lbs. 20% cream.....	7.56	3.42	11.32
8.5 lbs. 4% milk34
55.55	7.90	5.32	20.107
Per cent	14.2	9.6	36.5

I am also suggesting in Table Two a 10 per cent mix made up according to your description. You will notice this mix table two is made for 50 pounds or for one ten gallon batch.

Table 2.

Ingredients	Fat	Serum Sol.	Total Sol.
7.0 lbs sugar	6.650
.25 lbs. gum237
2.0 lbs. skim powder	1.9	1.9	1.900
21.4 lbs. 20% cream	4.28
19.35 lbs. 4% milk77	3.18	8.230
50.0	5.05	5.08	17.017
Per cent	10.0	10.0	34.0

* * *

We are making our batches in 4500 pound sizes and are running 12 per cent fats and 35 per cent total solids, standardizing each mix before using, as we have the Mojonier testing laboratory. Our normal mix is as follows: 230 gallons, four per cent milk, 532 pounds sweet butter, 100 gallons skim milk, 77 pounds of powdered milk, 452 pounds sugar, 300 pounds sweetened condensed, 22 pounds gelatine, 16 pounds impruv mix, 3½ pounds of Gumperts terminal improver. Water to make up 4500 pounds.

This is heated up to 150 degrees and homogenized at a pressure of about 1500 pounds and cooled down to 35 to forty before freezing and held 24 hours. This makes us a very excellent piece of goods. It is hardened in a room running from zero to ten below.

We do not have any general trouble with this. We will have on an average of some three to five complaints from various sources during a week. So far it has been almost entirely on vanilla ice cream. A good many of the complaints coming from shipping customers. The cream is not overwhipped as we are running around ninety per cent on our overrun. Today we received a packer back from one of our refrigerator trucks. It had originally been four gallons and had dropped to three. There was plenty of gelatine in it, in fact, there was a little too much as it showed the gelatine very plainly. The cream had not got very soft, was still in good serving condition when I saw it and weighed it. The three gallons weighed twenty and one-half pounds, indicating that the four gallons had weighed five and one-eighth pounds per gallon, which is really good heavy ice cream. If you can give us an idea we will appreciate it.

Reply: I am absolutely sure that this condition is not now due to any ingredients in the mix. The fact that you only have this trouble occasionally and only on your shipping trade, either railroad shipments or truck shipments, leads me to believe that the trouble is caused by an occasional can of cream not drawn at the right stage from the freezer. It is also possible that occasionally your overrun might get a little too high, although you seem to think that by weighing the cans that this is not the cause of your trouble. Drawing the

The Edible Gelatin Manufacturers of America, Inc.

An Association composed of the following manufacturers of Edible Gelatin:—

CRYSTAL GELATINE CO., Boston, Mass.

ESSEX GELATINE CO., Boston, Mass.

KIND & KNOX GELATIN CO., Camden, N. J.

MILLIGAN & HIGGINS GELATINE CO., New York, N. Y.

SWIFT & COMPANY, Chicago, Ill.

UNITED CHEMICAL AND ORGANIC PRODUCTS CO., Chicago, Ill.

UNITED STATES GELATINE CO., Milwaukee, Wis.

J. O. WHITTEN CO., Winchester, Mass.

Extends a cordial invitation to ice cream manufacturers and their friends to visit the Association booth (No. 112) at the National Convention and Supply Men's Exhibit in Cleveland, Ohio, October 22 to 27.

The Edible Gelatin Manufacturers of America, Inc., desires to announce that the broad study of the food value and uses of edible gelatin conducted at Mellon Institute of Industrial Research, University of Pittsburgh, Pittsburgh, Pa., has assumed such importance that the work will be continued on a much more extensive scale of practical utility during the coming year.

The results of the completed investigations will be demonstrated at booth No. 112 in Cleveland. There will also

be available for interested parties complete information regarding the uses and properties of edible gelatin. Much of the information will be of industrial interest and use to the ice cream manufacturer.

The research Bureau of The Edible Gelatin Manufacturers of America, Inc., at Mellon Institute of Industrial Research is pleased to be of advisory assistance in solving problems and answering technical questions pertaining to the use of edible gelatin in the manufacture of ice cream. During the present year, it has had the opportunity of rendering direct aid to a number of leading ice cream manufacturers. It is hoped that the booth at Cleveland will result in the extension of this service.

cream a little too soft from the freezer will make large air spaces in the cream and this sort of cream when hardened is apt to drop in the can.

In a number of similar cases in different parts of the country we have successfully eliminated this trouble by reducing the amount of sweetened condensed milk. You have done this, however, and you are not now, according to your formula, using an excessive amount of sweetened condensed. We found in another factory that the use of invert sugar syrup and corn syrup caused this trouble.

I suggest that you follow this up very closely, especially at the freezer, if necessary, marking some of the cans into which the ice cream is drawn rather soft and see if that will not locate this difficulty.

* * *

Dear Sir:—What acidity should ice cream have? What are the apparatus used, size of pipette, etc.

Reply: No ice cream factory should try to develop an acidity in the ice cream mix after the mix is once made, but should try to keep it just as sweet as possible. This can be accomplished by holding the mix at a low temperature.

The acidity of an ice cream mix will vary with the amount of milk solids the mix contains and especially milk serum solids. The average ice cream mix should contain some extra milk solids introduced into the milk in the form of skim milk powder or condensed milk.

I suggest that you order an acidity test apparatus from one of the creamery supply houses. They can furnish the test complete. This apparatus consists of a burette, for the alkali, the necessary pipettes, the alkali and the indicator as well as full directions for its use.

* * *

Dear Sir:—We are having some trouble with viscosity in our ice cream mix. It seems impossible to get the overrun which we want, i. e. about 90 per cent.

Our mix consists of 12 per cent fat, 37 per cent total solids of which 10 per cent is milk solids made up with whole milk and using skim powder, Merrill-Soule brand, to obtain our milk solids, not fat. We are using one-half of one per cent Delft gelatine and using butter to obtain our fat.

We cannot obtain the proper viscosity for the overrun desired, and would like your advice as to how to obtain this.

We are pasteurizing to 145 degrees, and holding 20 minutes; viscolizing at 1800 pounds pressure and cooling in vat with brine. We are using Washburn's improver, and holding forty-eight hours.

Reply: You stated that your mix contained 12 per cent butterfat and 10 per cent milk serum solids while it had a total solids content of 37 per cent. It seems hardly possible that with a mix of this kind you should not be able to get the overrun. It is possible that one-half of one per cent of your gelatine is not sufficient and you might try using about .7 per cent.

According to your information it also appears that you are using close to 16 per cent sugar, which is excessive. I suggest you reduce the sugar content to 14 per cent. This would give you a total solids of 35 per cent instead of 37 per cent. 35 per cent is plenty high.

If you are holding your mix forty-eight hours, I suggest that you try a few batches without the improver and see what results you get.

In case this does not solve your difficulty, I suggest that you write to me giving me a complete list showing every ingredient used so that I can calculate it. It is possible that you have something which your present letter did not fully describe.

OUR ADVERTISERS ARE YOUR FRIENDS—BUY FROM THEM.

Pioneering the Ice Cream Industry of Iowa

By F. K. UNDERWOOD*

ON FEBRUARY 15, 1892, I bought a half interest in the Asher & Green restaurant, located at 215 High Ave. West, Oskaloosa, Ia., and it became known as the Asher & Underwood restaurant. We gave but little attention to the serving of meals and gave more time to the manufacture of ice cream and candies. The ice cream business developed more rapidly for a time than

F. K. UNDERWOOD.

the candy business and in a short time we were shipping ice cream to many of the nearby towns. We were crushing ice with a very rude cast-iron mallet and freezing our cream in a six-gallon hand freezer. This equipment was such that it required two to three boys or men working one-half the night and all day during the warm months to put out 50 to 60 gallons of ice cream a day.

Before the first summer was over we conceived the idea of putting in a small upright steam boiler with engine attached.

employed a carpenter to make, and bolt to our old wheel on the six-gallon freezer, a wood covering to carry a belt. We put an advertisement in the local newspaper, "Asher & Underwood freezing cream by steam."

The people flocked to our place in considerable numbers to see how it was possible to freeze ice cream by steam.

Our new plan did not aid us greatly in getting more cream in a given time, as we had the notion the cream must be run in the freezer at least an hour and well frozen before removing from the freezer in order to be first class cream, and as a result we had a product over-run and frequently a coarse-grained cream.

If we happened to get a smooth batch, it was an accident. However, the small engine saved us considerable labor and gave us time to study out better methods of handling our cream before freezing as well as taking care of it after freezing.

The second year we put in a 10-gallon C. & B. right freezer and a power ice crusher. As for our product in those days the difference was not considerable from the present, using gelatine as a binder as many manufacturers do now. We gave little or no heed to the butterfat contained in a batch and in fact we had no means of knowledge of testing for butterfat.

At that time sweet cream was cheap and plentiful in this section and I believe if we could have tested this cream it would have run 7 or 8 per cent butterfat which I believe was ample for those days. In fact we feel that a standard of more than 7 or 8 per cent butterfat is detrimental to the public now inasmuch as it compels them to consume during the hot months a great quantity of butterfat that the human system does not need and which should be put in storage for the winter months when butter, as we all know, advances to a price beyond the pocketbook of many.

We have a modern equipped plant today but have not increased the ice cream business as we have the candy business due to the fact that there is a limit to the distance you can ship cream, and being in a small town it did not take long with modern machinery to reach a point where we could supply the demand.

Competition in Iowa has been so keen the past few years that I doubt that but few have made any considerable profit in the manufacturing of ice cream. It has made it very profitable to the retail dealer, however, who seems to have learned that he is entitled to a profit.

As to the future of the ice cream industry no one knows, but it would appear that consumption of ice cream will continue to increase to some extent more than the increase in population, due to advertising and improved facilities for handling same. I feel the wholesale manufacturer has a hard road to travel the next few years and attribute this to the over-zealous manufacturer of ice cream machinery who induces the retailers to put in equipment for manufacturing their own cream. As a result the wholesale manufacturer loses business and the retailer manufactures a poor quality cream in many cases and fails to make any money overhead expenses being too great.

The most successful retailer as a rule is not a manufacturer and the same might be said about the most successful manufacturer in the land. We do not know him retailing his product.

* President of The Underwood Co., Oskaloosa, Ia., and one of the oldest ice cream manufacturers in the state. Written especially for The Ice Cream Review.

The Cost of Broken Ice and Grades of Ice to Use.

By WILBERT SAILER*

WE will take up first the matter of broken ice costs. These costs, it will be appreciated, will vary for each plant, depending on its size, location, method of operation, etc.; but I am going to give you a summary of the results—the average values—which we have obtained after making a study of the broken ice reports from about 40 of the good-size plants throughout the country, not for the purpose of arriving at some standard cost which should apply to your plant, but more for the purpose of outlining a method of figuring on which you can base an investigation of your own particular conditions.

We will endeavor to arrive at a fair cost for broken ice, delivered at the packing floor or in the trucks, salted, ready for use. In order to do this we will work it up in five parts:

1. Cost of the ice itself.
2. Cost of breaking the ice.
3. Cost of handling and conveying the ice.
4. Loss of ice due to wastage, meltage, etc.
5. Cost of salting.

Of the five factors, the first, the cost of making or buying the ice, will probably admit of greater variation than any other, because the ice cost will depend on whether the ice is made or purchased, in what quantities it is used, nearness to a natural supply, and many other factors which are obvious to you. But in order to reach some sort of an average figure for the ice cream plant making its own ice we will use as a basis \$2.00 to \$3.00

*In address before Nineteenth Annual Meeting of the National Association of Ice Cream Manufacturers, October 7th, 1919, Chicago, Ill.

per ton, which is usually accepted as a fair manufacturing cost for ice. Where ice is purchased the cost will probably range from \$5.00 to \$7.00 per ton, depending on the quantity purchased and the proximity to supply.

Now, as to the actual cost of breaking the ice: Based on an average cost for power of, say, 5 cents a HP hour and on the breakers working, say 4 to 5 hours a day, study of the data secured shows that the power cost ranged from 1 cent a ton up to 12 cents, 15 cents or even 20 cents a ton. In the great majority of the plants, however, the cost ranged from 1 to 5 cents per ton, indicating an average cost of about 3 cents or 4 cents per ton, which checks very closely with results which we secured from experimental tests on machines. When the higher costs were encountered it is probable that incorrect data was given, or else other equipment was included in the power consumed by the breakers.

Or, again, the high cost for breaking may have been due to inefficient installation or operation, some features of which we will endeavor to point out:

(A) Excessive friction loss in the breaker bearing and in the driving shaft bearings. It is amazing to see the number of plants in which the proper care and oiling of the breaker bearings is absolutely neglected. In other cases a shot of oil every once in a while is deemed to be sufficient. In many plants it takes more power to overcome the friction in misaligned driving shafts and neglected bearings than it does to actually break the ice.

Bearings Should Be Oiled.

Every bearing, even those in isolated places, should be oiled at least twice a week and given frequent inspections so that worn-out bearings can be replaced. Many ice breakers are installed down in pits or in other inaccessible places; in these cases arrange to run a pipe from the bearings to some convenient point where the oil can be applied. The best solution of the problem is to establish some sort of routine in your plant whereby it is the duty of one or more specified men at certain specific times to make rounds of the bearings and insure their being given attention. A half a day a week of one man spent on giving intelligent and careful attention to all the bearings in the plant is a good investment. Where a forced system of oiling is installed in the engine room or throughout the plant, do not neglect to provide a connection for the breaker equipment. Ordinarily, grease cups are not to be recommended for use on breaker equipment, because the machines are usually installed in cold, damp locations.

(B) Belt slippage also often accounts for considerable loss in power. The presence of moisture and snow and jars makes difficult the work of a breaker driving belt. You can help it along by observing the following points:

Use a belt of generous size.

Keep the diameters of the pulleys as large as possible, so that ample tractive surface for the belt is secured. A large pulley on the breaker gives the benefit of increased leverage as well.

Where short driving centers are encountered small pulleys must be used do not use a thick belt, use a thin belt, so that it may more readily cling to the pulley surface if necessary. Use a wider belt to compensate for the lightness.

If leather belting does not stand up under moisture, use a rubber or balata belt, which should

It is understood that if I decide to order an Everhot equipment from you, it will be subject to final acceptance after inspection and trial.

run rather slack because of the change in length which takes place with weather conditions. The best arrangement is to run the belt loose, with a weighted or spring loaded idler to take up the slack and to give the greater bearing arc on the pulley face.

Install a waterproof cover for the belt drive if excessive water or moisture is present.

Intelligent use of belt dressing will also often cut down slippage loss, as will also the use of special pulleys with cork inserts, etc.

Keep on hand, right at the breaker, a spare belt, cut to size and joined, ready to slip onto the pulleys in case the regular belt loosens up or goes bad.

Where space is limited it is becoming common practice to drive the breakers with gears directly connected to the motor. The secret of success in this work is to make the gears extra size; figure out the theoretical gear face you should use, and then double it as a precaution against breakage under this severe service. Chain and sprocket drive is also adaptable where short centers are found.

(C) The service in driving a breaker is so severe that there is a strong temptation to play quite safe when selecting the motor to drive it; and while this in general is good policy, care should be taken not to overdo it. We have seen a number of installations where a 12½ or 15 HP motor is installed on a machine that would be amply well taken care of by a 7½ HP motor. The big motor running at very light load naturally does not operate at its best efficiency.

If you have trouble from moisture in your breaker motor, try burning a couple of electric lights under the armature and around the windings; the heat will tend to keep these parts fairly dry.

The upkeep cost of a breaker can be much or very little, depending on the manner in which the breaker is fed and the attention given to the machine. Throwing the cakes into the hopper from a distance of 8 or 10 feet, or the feeding of cakes in such a manner that they strike the side frame of the machine, naturally increases wear and tear. Just as the breaker should be regularly oiled, it should be gone over from time to time and the bearings taken up where needed and all loosened nuts drawn tight.

Give your machines a coat of good waterproof paint occasionally instead of allowing them to rust and corrode.

Your repair cost will also be kept at the minimum if an oversize breaker is used; it is more economical in every way to have a breaker a little bit larger for your work than to have it too small. The difference in power

cost is negligible; it allows you to handle the ice cakes without too much labor for cutting them up; it is easier to feed, because of the larger receiving hopper, and it gives you a reserve capacity for your peak loads. It is also good practice to install breakers in duplicate, to guard against tie-ups from break-downs, etc.

Figure up your cost for power chargeable to your breaking equipment. If it runs over 4 cents a ton look into some of the points briefly outlined above, and you can expect to effect a material saving.

Cost of Handling.

Taking up the third point, that of cost of handling it can be figured that in the average plant two men ought to be on the job feeding the breakers during the busy hours, and for this service a charge of 5 cents a ton would probably be involved. If automatic conveyors do the work, the cost ought to be cut down to 2 or 3 cents a ton.

In the more up-to-date plants the ice handling charge is being kept down to the minimum by proper design taking advantage as much as possible of the force of gravity. Usually the ice is made on one of the upper floors, passed to the storage room, suspended beneath the floor of which is located the breaker equipment. The ice cakes are fed into the breakers from the storage room, being slid into the breaker hoppers without lifting, and from the breaker the broken ice is passed by gravity into the wagons, or distributed across the shipping platform by means of screw conveyors.

The fourth factor which affects the final cost of the broken ice is the wastage of ice which takes place, due to the loss through slush, meltage and scattered pieces. The loss through fine ice production in the breakers will run as high as 10 or even 20 per cent, depending on the quality of the ice and the efficiency of the breaker, which points we will cover more fully in a few minutes. The loss through meltage, waste and scattered pieces will bring this figure for loss well up to 25 per cent, which is unproductive, and should enter into the cost of the broken ice actually used. Carelessness and thoughtlessness on the part of the platform helpers and drivers can run this loss up to astonishing figures. This can only be counteracted by proper supervision; if you posted a sign in your loading room stating that each shovel of crushed ice represented, say, 5 cents in cash, might have a good moral effect on the force.

The fifth item is that of salting cost. It is most difficult to arrive at any practice which might be considered as standard in this respect, but observation shows that the proportion used in the average plant will vary from 1 part of salt to 6 to 10 parts of ice, the heavier salting being the rule where long-distance

EQUIPMENT FOR HANDLING

MILK FROM COW TO CONSUMER

A Personal Invitation

When you get to Cleveland next month, there will be awaiting you the largest and most complete exhibition of equipment for the Ice Cream Industry that has yet been staged. I can assure you that no previous event will equal it.

On the first floor, right at the entrance of the Public Hall, where this Exposition will be held, you will find the Cherry-Bassett-Winner exhibit. I want to personally invite you to visit our space and examine our equipment. We have tried to make it worth a visit.

More than that, make the space your headquarters. Every Bestov man will be glad to act as your host. Come in and join the friendly group!

I hope, too, that you will allow us to help you complete arrangements for your trip, should the need arise between now and October 22nd.

Look for the illuminated Bestov trade mark and when you have found it, please come in!

Cordially yours,

CHERRY-BASSETT-WINNER COMPANY.

ADVERTISING IN THE ICE CREAM REVIEW IS A GUARANTEE OF MERIT.

shipments are made. The cost of salt will run around \$10.00 or \$15.00 a ton at the plant. Taking, then, an average cost of, say, \$12.00 a ton, and a generous salt and ice ratio of 1 to 6, we find the cost for salt per ton of ice to be about \$2.00.

Summing up all these items of cost we have:

Ice making, say	\$2.50 per ton
Ice breaking (power)04 per ton
Ice handling05 per ton
Ice wastage at 25%66 per ton
Salt at \$12.00 ton and 6:1	2.00 per ton

Total cost for broken ice at wagons... \$5.25 per ton or an average cost of .26 cents per pound ($\frac{1}{4}$ cent.)

Carrying the analysis one step further, we find from the information submitted by the 40-some plants mentioned above that the quantity of ice produced per gallon of ice cream (normal rated capacity) runs from 12 to 30 pounds of ice per gallon of ice cream, or an average of 20 pounds of ice per gallon. Figuring the ice cost, broken and salted, as about one-fourth cent per pound, we arrive at a total icing cost of five cents per gallon, which checks very closely with the figure given us by a number of ice cream makers.

Now, coming to the grade of broken ice to be used, the consensus of all opinion received is that ice pieces ranging from $1\frac{1}{2}$ to 2 inches in size are the best suited for packing purposes. It is therefore desirable to secure the ice broken as near as possible to this size, or any other size which the individual plant may find best suited for its work, and we will outline below some of the factors which affect this control:

1. Comb regulation. Most of the commercial ice crushers are fitted with interchangeable combs for

regulating the broken ice size, the object of the comb being to retain the ice pieces until they have been reduced to the proper size, this size depending on the number of teeth or projections on the comb. For general ice cream plant work what is generally known as the fine comb gives the best results. Many operators lose sight of the adjustment obtainable by changing combs, and put up with an inferior and wasteful grade of ice, whereas the simple expedient of changing the comb would result in greatly improved conditions. Always keep one or two extra or spare combs on hand for replacement. If several of the teeth or projections on the comb are broken off, take it out and put in new ones; the slight cost of the comb will be more than repaid in better and more uniform ice control.

2. Adjustment by moving front plate. Further adjustment can also be made in some ice breakers by moving the front plate (the plate to which the comb is attached) closer to or further away from the revolving drum and picks. If the front plate is moved further away from the drum, it allows greater space for the broken pieces to fall through and tends to make the ice grade coarser. Moving the front plate closer to the drum will have the opposite effect.

3. Speed of the breaker. The speed at which the breaker turns has quite an effect on the grade of ice turned out. For ice cream plant work we have found that a speed of 100 to 115 r.p.m. gives the most uniform and satisfactory grade of ice. Increasing the speed above this point will cause more snow ice, because of the slushing effect which the fast-turning drum and picks have on the ice. Running the machine between 80 and 95 r. p. m. is recommended where coarser and more uniform grades are desired. We have seen several breakers running at speeds of 175 and 200 r. p. m.—dangerous as well as inefficient practice.

4. The quality of the ice also has a bearing on the grade of broken ice secured. Ice which is quickly frozen has a tendency to fall apart into a large portion of snow when struck by the picks; and with this grade of ice it is difficult to secure good regulation and prevent excessive waste. On the other hand, clear, firmly frozen ice such as natural ice, breaks clean and sharp and produces less snow ice than the other. In one plant where difficulty was being experienced in securing good broken ice regulation because of the use of soft white ice conditions were improved by allowing the ice cakes to stand for an hour or so in the outer room, instead of feeding them into the crushers direct from the storage room.

5. More uniform grades of broken ice can be obtained by feeding full-size cakes or half-size cakes that can be obtained by throwing the ice into the crushers in small pieces.

6. The points of the picks, the breaking tool of the machine, should obviously be kept in good sharp condition, making possible a clean, sharp cut and, incidentally, saving power. Picks made of steel forgings can be dressed up on a grindstone, with a file, or they can be repointed by your blacksmith. Do not sacrifice the capacity of the breaker by running it without the full complement of picks. Keep a few spare picks on hand all the time for replacement.

7. Where long conveyors, elevators or intricate chutes are used there is often apt to be a little breakage to the ice in passing through them. If this is the case it can be compensated for by adjusting the breaker to turn out a bit coarser grade of ice.

It is a good idea to experiment a little with the relative values of different grades of ice, to see which one is best suited for your particular plant, bearing in mind that almost any desired grade can be obtained by giving

attention to the following. Having proper comb in the machine, adjusting the front plate, operating machine at the proper speed, keeping track of the quality of your ice cakes and the manner in which they are frozen, the manner in which the ice cakes are fed, the condition of the picks in the machine, and also the breakage which may occur in your conveying system.

BOOK REVIEW.

Reprinted From the Journal of Dairy Science
Vol. VI, No. 3, May, 1923.

The Technical Control of Dairy Products by Timothy Mojonnier and Hugh Charles Troy is a real attempt to assemble an extensive treatise on the testing, analyzing and standardizing of dairy products and the manufacture of ice cream, condensed and evaporated milks. Beginning with a description of the dairy plant laboratory and its equipment a detailed technical discussion of the average composition of milk and the nature of milk constituents is presented in the form of an introduction into the field of dairy manufacturing.

In subsequent six chapters are given precise directions and pointed precautions in regards to sampling and testing various dairy products for butterfat and total solids. A brief history of the various tests for butterfat is related and emphasis is made regarding the Mojonnier butterfat test or the modified Rose-Gottlieb method as employed in connection with the Mojonnier tester.

Several methods of standardizing milk, cream and condensed milks for butterfat and solids not fat plus detailed calculations for condensed milks are illustrated

by formulas of typical problems and by the aid of extensive tables.

A special chapter is devoted to the composition and standardization of ice cream mixes and is supplemented by a set of problems and painstaking compiled tables to facilitate computations involved in the standardization of the ice cream batch.

Under Chapter XV entitled "The Overrun in Ice Cream" various factors influencing the same through the different processes employed in ice cream manufacturing are discussed in the light of facts learned in different experiments on ice cream making.

A very instructive chapter on dairy bacteriology with explanations of "starters" and their uses in dairy products offers material which has never before been brought in such compact and practical shape. A chapter on dairy chemistry covering the most practical chemical analyses of constituents employed in dairy manufacturing is very comprehensive and can be highly recommended as a reliable reference to students in dairying.

Detailed description of the vacuum pan and a simple and clear presentation of the manifold problems involved in the processes of condensing milk and methods of sterilizing evaporated milk is a prominent feature of this treatise.

Essentials pertaining to milk inspection and scoring of various dairy products followed by definitions and standards for dairy and related products are conspicuously displayed.

The last Chapter XXII gives diagrammatic illustrations of flow sheets of various phases of dairy manufacturing; indicates temperatures for holding, processing, and storing dairy products; it also gives a discussion relating the properties of metals and alloys and their effects on milk.

There are useful tables in the appendix and at the end of each chapter a bibliography of references is given to indicate the source of information on the various problems discussed in each chapter of the book. The systematic arrangement of the tables and illustrations in connection with a clear expression of rather technical matter makes it easily comprehended by the nontechnical reader as well as the dairy expert. This book provides valuable information to the dairy technologist, the ice cream maker, the manufacturer of condensed and evaporated milks as well as to the creamery man and student in dairy manufacturing. It may be considered a worth while attempt to furnish the dairy manufacturer with a reference book somewhat similar in nature to Henry's "Feeds and Feeding" used by the stockman, the production man.

BENJAMIN MASUROVSKY,
Lincoln, Neb.

One department store in Rochester, N. Y., which does a big soda and ice cream business, made a big play for increased sales by appealing to the shoppers. Bottles of soft drinks and jars of soda fountain fruits were neatly grouped on a tier of glass shelves. This display was backed by these two appeals:

"A Haven of Rest for Tired Shoppers."

"Visit our soda fountain first—makes shopping a real pleasure."

There is no appeal that goes home stronger than the shopping appeal if the dealer is located in the downtown section.—Colonial Mixer.

Robb Tells of Ice Cream Industry's Development in Pacific Coast Northwest

W. V. S. Robb, president of the Pacific Northwest Ice Cream Manufacturers' Association, and head of Hollywood, Inc., Seattle, is one ice cream manufacturer who goes in wholeheartedly for civic and commercial club activities. He recently was the principal speaker at a luncheon of the Auburn Commercial Club and took the occasion to tell the members of that organization something about the progress of the wholesale ice cream industry, particularly on the Pacific Coast.

Dairying Is Important.

"Since the manufacture of ice cream is closely allied to the dairy industry, I want first to call your attention to the importance of the latter," began Mr. Robb. "The total value of this country's dairy output during the past year has reached a staggering sum—a sum that exceeds the combined value of half a dozen of the country's most important industries.

Value of Washington's Dairy Products \$29,000,000.

"In Washington alone the value of our dairy products for 1922 was \$29,000,000. And as you all know, the greater part of this, probably two-thirds, was produced in the western part of the state. Dairying is probably the state's most important single industry.

"It is probably due to the fact that ice cream is coming to be known as a real, valuable article of food rather than a luxury, that the consumption of this food has increased from 80,000,000 gallons yearly to over 200,000,000 yearly within the past three years. Formerly ice cream was considered a delicacy and its

healthful qualities were unknown. All kinds of concoctions were produced under the name of ice cream, and there was no such thing as a fixed standard of quality.

"An important phase of the industry, and one in which it fills an important niche, is the fact that ice cream manufacturing takes up the slack in dairy production. The flush of milk production is of course in the summer time, and by using such a large amount during this period the ice cream manufacturer helps in an important degree to keep milk prices up. It is an important but almost unbelievable fact that more milk is used throughout the United States for manufacture of ice cream than the combined total used in making condensed and evaporated milk.

Made in Smaller Forms.

"The trend in the industry at present, I believe, is toward the manufacture of ice cream locally in the smaller cities and communities. Auburn is an example. Formerly virtually all of the ice cream consumed here was shipped in, and now with establishing here of a modern factory, such as you have, the shipping-in is eliminated to a large extent. I want to say that the Auburn Ice Cream Co. plant and organization is a very creditable one, one that this city may well be proud of. It is an industry yet in its infancy, but it has made remarkable strides and promises a continued growth."

Mr. Robb concluded his remarks by telling of the function of the Pacific Northwest Ice Cream Manufacturers' Association and how it plays an important part in maintaining a high standard of production.

IMPORTANT CLARIFICATION OF FAIR PRACTICES CODE.

Preface of The Association of Ice Cream Supply Men's Honor Document Revised.

The board of directors of The Association of Ice Cream Supply Men has informed members of the association of a revision of the prefatory statement to the Fair Practices Code of the Association.

The Code, adopted by unanimous vote at a general meeting of the Association in 1920, has heretofore been prefaced by the following statement:

The Fair Practices Code of The Association of Ice Cream Supply Men.

The Code of the Association declared the following practices by its member firms unfair, and proof of their commission grounds for expulsion and for full publicity.

After due consideration and constitutional action, the Board of Directors of the Association has revised that statement to read as follows:

"The Fair Practices Code of The Association of Ice Cream Supply Men.

Adopted at Atlantic City, September 20, 1920.

"The Code of the Association declares the following practices by its member firms unfair and proof of their commission grounds for expulsion and full publicity. (Constitution of the Association, Article X.)

"The Fair Practices Code shall apply to members whether they are manufacturers, dealers, distributors, agents, or otherwise engaged in any other business or occupation, so long as they are members of the Association.

"The Fair Practices Code shall be construed liberally with the intent of prohibiting any and all unfair practices and the construction and interpretation of each and every clause of the said Code as interpreted by the Board of Directors shall be binding upon the members and shall be conclusive in all proceedings under Article X of the Constitution."

Model A Ice Cream Packaging Machine in the plant of the Carroll Co., Chicago.

SOME REASONS WHY—

There are 19 Mojonnier Ice Cream Packaging Machines in Chicago alone:

THE MOJONNIER Ice Cream Packaging Machine—

1. Fills exact measured quantity.
2. Keeps Cream untouched by human hands.
3. Insures "fine bulk texture" in "brick ice cream."
4. Fills practically any type of package.
5. Hermetically seals into the finished package the fine flavors used.
6. Reduces "shrinkage" to a minimum.
7. Minimizes loss of ice cream in freezer and hardening rooms.
8. Improves the package.
9. Meets with unqualified endorsement of Dr. John Dill Robertson, for many years Chicago Health Commissioner.

What Chicago manufacturers have done en masse, other ice cream manufacturers from the Atlantic to the Pacific are doing. The Mojonnier method is now becoming the standard method for packaging ice cream of quality. 16-page booklet, "Packaged Ice Cream" sent on request.

The Feminine Slant

By FANNIE KILBOURNE*

(Concluded from September issue)

WHEN Susan reached the red-brick building at 8:30 the next morning, something had gone wrong with one of the motor trucks, and the president of the Maple Leaf Co., whistling, in his shirt-sleeves, was experimenting with it himself. He waved a monkey wrench at Susan and raised a jovial face, streaked across one cheek with oil and grime.

Willard's very smile twisted at her heart; she could have run across the truck-room and put her arms about him in a vain, shielding, womanly way. Instead she said only:

"Just as soon as you have a moment to spare may I speak to you? It is something rather important."

The truck's engine began to throb evenly, and wiping his hands on a piece of waste, Willard followed Susan into the office.

All the gayety had left the man's face long before she had finished. He nodded once or twice.

"So that's their game. That's why they have been keeping so quiet. They've simply been waiting to see whether we were going to be worth while to crush. I suppose it's a sort of compliment that they consider us worth it." He laughed grimly.

"They consider us worth it," said Susan. "Mr. Ledder practically admitted that but for this price-cutting, nothing could stop us."

"I'm a fool," said Willard, "not to have foreseen this. Even Uncle Miles didn't though—that's a minor consolation, and I've checked up every point as it came along with him."

He sat staring at the edge of Susan's desk in silence. Finally he rose, washed off the grime, and donned his coat.

"If anyone needs me," he told the stenographer, "I'll be back by noon. I'm going to see how much more money I can raise."

At the door he met Dan Mahoney, just coming in.

"Dan," he said, "will you go through the plant this morning with a fine-tooth comb and see where any possible cuts in expense can be made, any doubling, anything that we could possibly do for a while on a pinch?"

"Sure," said the surprised Dan.

So Willard went out after capital, and Dan into the freezer-room to check up on production. Production and capital at work, advertising waiting. As Susan sat

down at her darkwood desk, it seemed suddenly as though she were linked with the whole feminine slant on life—waiting for her.

While she waited, she glanced idly over the proofs that lay on her desk, full-page advertisements that were to appear in day after tomorrow's newspapers. There was the one she and Willard had laughed over so proudly only yesterday morning:

"Your silver bridge-prize will bear the 'sterling' mark, of course.

"The Maple Leaf frozen in each slice of your ice cream means the same thing."

Then there was the page in The Daily Gazette, the newspaper which reached the shop people, the mill workers. This had to advertise bulk ice cream, and showed the quaintly dashing counter sign which had been given to every druggist or confectioner serving Maple Leaf. Under it appeared the words:

A Sweetheart Test

If you see this little sign when he takes you in for a soda or a sundae, he is the kind of man who always buys a girl the best.

These proofs had looked so interesting, so promising to her and Willard only yesterday! Dan Mahoney came back from the freezer-room just then and sat down to his desk, a worried frown on his good-natured Irish face. A bit of Ledder's conversation came back to Susan.

"Here we are," she thought bitterly, "Production and Advertising, the little brothers in Business. Business is capital. Mr. Willard is out now after capital; and he won't get it—not enough. Ledder knew last night that he couldn't, or he wouldn't have told me what Wiley's were going to do."

Willard came in at noon looking drawn and worried. He and Mahoney had a long talk in which there was much shaking of heads. Willard dictated two letters to the stenographer.

"I may be late this afternoon," he told her, "but I'll be in to sign them. Just leave them on my desk."

And just as Susan came in from luncheon, he was off again.

* * *

At 5 o'clock promptly the bookkeeper and stenographer cleared their desks and left. Donaldson blew in for a breezy moment, then out again to catch the lake car. Dan had an appointment with his wife, and, after waiting uneasily for 10 minutes, scribbled a note which he left on Willard's desk, and took a hurried departure. One of the trucks was still out; Susan was alone in the red-brick building. She knew with an uncanny feminine instinct that Willard would come back beaten. And she did not wish him to come back alone to a deserted building.

And then, suddenly, coming as amazingly as a miracle she saw a way out.

She sat staring at the faded hyacinth, her lips parted, her arms crinkling to the very fingertips with excitement. For a brief instant she forgot Willard entirely in the thrill of it.

The idea was so simple that she wondered she had not thought of it before, wondered that Willard had not thought of it, or Ledder himself. Willard, of course, might not approve. But she would be ready in case he did. With a nervous glance at her desk clock, she tele

Increase Your Ice Cream Sales During the Winter Months

Millions of these Packaged Sundae Kups were used last winter, by many of the largest ice cream makers, for marketing Packaged Sundaes. It was the means of increasing their winter sales—made an unprofitable season a paying season. No better time than now to plan for your own winter activities. Get the added profit awaiting all who make and market Packaged Sundaes. Use this, the most practical and neat appearing of all packages. It actually sells its contents.

Strongly made of snow-white spruce-wood-fiber. No objectionable wax. Large unobstructed opening means easy filling and removal of contents. Self-sealing lid. Nest when empty—taking little storage space. The Mono-Paper-Spoon is part of the package.

KLEEN KUP

Send for samples, interesting prices and other important information regarding the "Packaged Sundae Idea" that eliminates the problem of selling your winter output.

MONO SERVICE CO.
NEWARK, N. J.

MEMBER—YOU ARE JUST AS MUCH A MEMBER OF THE ASSOCIATION NOW AS YOU WERE LAST WINTER.

phoned The Journal. Carlyle, fortunately, was still there.

"Is there still time," she asked eagerly, "to add a line to our big advertisement?"

There was a little pause while Carlyle called the composing room. Then:

"Plenty," he assured her, "if you can get it in first thing in the morning. I suppose you want the same type?"

"Just the same," Susan assured him. "And if we want to run it, I'll have it ready before 8:30 tomorrow."

Then she called the other two newspaper offices. She had just hung up the receiver after having received the third's assurance when Willard came in. One glance at his face was enough to tell her the truth.

"Well, I'm licked," he said grimly. "I can get a few thousand—not enough to be a drop in the bucket for a long fight. There's no use going to Uncle Miles—that was our agreement; I wasn't to ask for an extra penny; and he's a man who sticks by agreements to the letter."

He picked up the notes Mahoney had left on his desk, studied them for a few moments.

"We can meet the first cut," he said, "and that's all."

He sat down at his desk, staring dully before him. He glanced up sharply as Susan spoke.

"I've thought of something," she said. "If there isn't any other way out, it might be worth trying."

"What is it?"

"It's just this: don't let's try to meet Wiley's price war at all. Don't let's cut Maple Leaf even once. All the response we've had so far has been to just one type of advertising—the quality angle. If that advertising has been done well enough, if the women have been

really convinced that Maple Leaf is the best ice cream made, the kind of women who wouldn't buy it aren't going to be stopped by a difference of 20 cents a gallon wholesale."

"But the dealers—" Willard began dubiously.

"The dealers will carry any ice cream there is a big enough demand for. We can't beat Wiley's game, anyhow, playing it the same way—let's try playing it just the opposite. We are lucky enough to know ahead what they're going to do. This first cut takes place the very day Maple Leaf comes out—let's make a challenge of it. See, this is what I mean."

She passed across the three advertisements. Across the bottom of the first she had written in large bold letters a proud, almost insolent defiance:

"More Expensive than Ordinary Cream? Naturally."

For several instants Willard blinked in surprise at the haughty challenge.

"There's nothing," Susan said eagerly, "nothing that makes a woman so sure she's getting quality as to have to pay for it."

Willard nodded.

"It makes cheaper creams seem ordinary," Susan went on breathlessly. "It will make Maple Leaf seem exclusive—exclusive, and yet not so very much more expensive. Oh, that combination gets a woman every time—to be exclusive at a price she can afford."

"I'd put it differently in the different advertisements, of course. Under the 'Sweetheart Test,' I'd say 'A man who always buys a girl the best—and doesn't care what it costs.' But in one way or another we'll play up the price everywhere—make it a talking point instead of something to be hidden and explained away. Oh, don't you believe it might work?" Susan Alice's eyes were starry with eagerness; she leaned across her desk toward Willard. "Don't let's try to sneak under Wiley's; let's stand right up to the guns. Let Wiley cut!"

Willard stood up, his own eyes afire too.

"Susan Alice," he said with a solemnity which made the profanity both a prayer and a promise. "I'll gamble Maple Leaf on the feminine slant. Let Wiley cut!"

* * *

As a matter of fact, the Wiley Ice Cream Co. limited its fight to one cut. During the month this was in force the new competitor lost two orders to five it gained. After the 30 days Wiley's went back to its original price, a tangible, definite retreat. Maple Leaf promptly raised its price. They had begun using the slogan "The More Expensive Cream."

"And we've got to live up to our boast," Willard

"Simplicity"

is a most essential requirement in a successful refrigerating system for Dairy Manufacturing plants.

Here is simplicity—

From Ramming Sand into Mould to Final Inspection

Every effort of this organization is directed toward making a quality of Sanitary Fittings that will meet the most exacting demands of the Dairy Industry—and your demands in particular. Fittings made in the two factories of the Specialty Brass Company are rightly sloganized as—

“Fittings to Fit Your Needs”

Dependable Dealers

throughout the United States, Canada and the European Countries, have found that Specialty Brass Company's Sanitary Fittings give perfect satisfaction to the plant operator and are really the **“Fittings to Fit Your Needs.”**

Standardized Fittings

Made in accordance with the recommendations of the Standardization Committee of the International Milk Dealers' Association will be shown at the Dairy Exposition for the first time. As usual we have taken an active part in this forward movement, which has resulted in Standardized Fittings that are interchangeable, irrespective of who manufactures them.

Certainly!!

we will be represented at the National Dairy Exposition, to be held in Syracuse, N. Y., October 5-13. Our exhibit of **“Fittings to Fit Your Needs”** will be in spaces 49-50. Everyone connected with the Dairy Industry will be welcome to make our spaces their headquarters.

Specialty Brass Company

*Brass Founders and Machinists
to the Dairy Industry*

told Susan, "even if it does burden us with outrageous profits."

It was at a luncheon of the Advertising Club in July, after a Fourth whose sheer volume of business had all but swamped the new company, that Susan saw Ledder again.

"Well, I see you people have put it across after all," he said genially.

Susan smiled her friendliest smile.

"After all," she said, "there's room in a city this size for both of us, isn't there?"

"It looks," said the great Frederick Ledder, "as though from now on there might have to be."

And as they were finishing their dessert:

"Well, if you should ever change your mind about staying with Willard," Ledder observed, "come and see me. The Wiley offer holds good."

"Thank you, but there isn't a chance. I've already agreed to a permanent connection with—the Maple Leaf," said Susan Alice—both of her.

THE BOOK OF ICE CREAM.

A new edition of "The Book of Ice Cream," by Prof. Walter W. Fisk, of Cornell University, is announced.

The principles of ice cream making and handling are discussed for the benefit of the manufacturer of ice cream and the student of the subject.

The opening chapters treat of the materials used, such as the various forms of milk, the stabilizers and fillers, and the flavoring materials. Succeeding chapters deal with the classification of ice creams (with recipes), the equipment and refrigeration, the actual making of ice cream, the bacteriology of ice cream, and the marketing of the product.

For this new edition Mr. Fisk has added a section on standardizing the ice cream mix which gives a full description of two simple and accurate methods of standardization, and adds greatly to the practical value of the book.

Copies will be furnished promptly, postage prepaid, upon receipt of order. Send \$3.50 to The Olsen Publishing Company, Fifth & Cherry Streets, Milwaukee, Wis.

Don't let that used machinery of yours stand in your way. Turn it into cash by advertising it for sale in the "Review" Want Department.

PACIFIC MANUFACTURERS PREPARING FOR LIVELY CONVENTION.

A trade association should have such a membership that it can be representative of the industry with problems affecting the general advance of that industry.

Ever since the organization of the Pacific Ice Cream Manufacturers' Association we have striven to bring all of the men connected with our industry together on the common ground of the association, both for the benefit of the individual operator and the ice cream industry over the territory covered by us.

A trade association should be prepared to consider all problems affecting the general advance of its industry or branch of commerce, and that is what "your association" proposes to do at the Eighth Annual Convention to be held in Vancouver, B. C., December 3rd, 4th and 5th, 1923.

We want every member to attend; further, we want them to induce their competitors to attend with them. If they are not members after this meeting, they will at least be better competitors in the future, when they have listened to the program arranged for their instruction and enjoyed the entertainment to be provided for them.

It is not too late to write the secretary regarding any subject you would care to have discussed. We know some of the members have problems confronting them that could be made easier when they get the other fellow's viewpoint. Send them in at once. The convention is for you, and the committee want to serve you. Kindly give us your co-operation in making this occasion the most interesting and instructive we have ever attempted.

BRING THE LADIES WITH YOU. We are sure "friend wife" will enjoy the trip to Vancouver. The ladies' committee will look after the comfort of the visitors. There are many interesting points to visit, and those who are interested in the program will be welcomed at each session.

Your plant operators will obtain a lot of valuable information at the session, and may be able to have some of the troublesome questions settled by asking the other fellow about it.

Make your reservations early to insure the accommodations you wish. The Hotel Vancouver will be headquarters for the convention, and we will supply reservation cards for your convenience.

PLAN TO BE AT VANCOUVER, DECEMBER 3rd, 4th and 5th. YOU'LL ENJOY IT.

We will meet you there.

Attest: **W. V. S. ROBB, President.**
BERT H. WALKER, Secretary.

THE NEWEST PLANT IN THE NORTHWEST.

(Continued from page 12)

ing is a great, big rest room for women employees, furnished with lounges and easy rocking chairs so that after lunch rest and harmless recreation can be indulged.

A chemical laboratory, furnished with every modern device for constantly and continuously analyzing every article of every ingredient that goes into Ives delicious ice cream, is part of the equipment of the plant and under the management of Dr. Richard Swart, a graduate of the University of Minnesota and it attracts ice cream men from other cities as well as scientific students from the local university.

The cream supply is procured from a creamery and condensing plant owned by the Ives Company at Helena, Minn., as well as the entire output of a sizeable plant at Cologne, Minn. Every day, cooled to a low temperature, this cream comes to the Minneapolis plant and is immediately raised to the third floor. Three 1,000-gallon pasteurizers, all lined with glass, process the cream and after passing through a huge viscolizer it is pumped into storage tanks and held until needed. There are six of these great storage tanks in the Ives plant. Every one is lined with glass, thereby insuring the very highest degree of sanitation and purity and in these tanks it is possible to store and keep at uniform temperature more than 10,000 gallons of cream at one time.

The freezers are automatically controlled by process controllers; these controllers eliminate all "guess work" during the freezing process and due to these, Ives can guarantee a uniform grade of cream.

After the cream is frozen it falls into nicked copper hoppers and from there through six-inch silvered pipes to the floor below where it is packed in cans and stored in hardening rooms until ready for delivery.

Another unusual feature of the Ives plant is the capacity and efficiency of these hardening and storage rooms. There are four of them altogether with a combined capacity of 3,500 square feet and in addition there are two storage rooms each 18 x 24 feet for the old storage of fruits and nuts.

Brick ice cream, which has come into unusual popularity in recent years, is given a department all its own. Three freezers are assigned to brick making and the brick boxes are filled by machinery so that from beginning to end the delicate product is not touched by hand. Incidentally the cartons that carry the brick ice cream are assembled and put together in the plant and even the simple job of tying up a brick of ice cream is done by machinery.

One distinctive departure in the new plant is the money ice cream department. Eventually it will be one of the show places of the plant because of the completeness and novelty of the equipment. Finished in white throughout and furnished with modern baking and freezing devices, the expert in charge will be able to produce ice cream confections for any occasion ranging from the simple moulds of flowers, fruit, emblems, etc., to the most elaborate set pieces to grace the precocious dinner. This department is entirely new with the new people and its installation will undoubtedly fill a want long felt in Minneapolis.

Naturally, ice plays an important part in the production of ice cream and in this department the Ives plant is fortified for years of future growth. The present capacity of the ice plant is 120 tons of ice every twenty-four hours and, if necessary, this capacity can be increased.

(Continued on next page)

**SENT FREE****IF YOU WILL FILL OUT THE COUPON****Refrigeration Facts**

To any ice cream manufacturer we will gladly send this booklet. It contains some useful information that you will want to keep, besides showing how the Baker Ice Machine is especially adapted to meet every refrigerating problem of the ice cream manufacturer.

The Baker is a slow speed type, which is a positive guarantee of economical operation. Any man knows that if he races a horse at top speed all the time the horse soon wears out—so it is with an ice machine. Some of the first machines built 17 years ago are still in daily service.

**Baker Plants are Cheaper Now Than Before the War**

Any manufacturer who does not use mechanical refrigeration absolutely loses money every day in cost of operation.

With the new low prices of the Baker Plants there is no need for any company suffering such loss, especially when a Baker will cut manufacturing costs from 50% to 75% over ice and salt.

We will gladly estimate the cost of installing a Baker in your plant without obligation to you.

PROSPERITY FOLLOWS THE DAIRY COW. Be sure you attend the National Dairy Exposition—Syracuse, N. Y., Oct. 5-13.

Ten carloads of salt for packing tubs can be stored in the salt bins and the packing is all done by automatic machines eliminating unnecessary labor and enabling prompt movement.

For the following further description of the Ives plant touching on the mechanical features, we are indebted to Chas. A. Berger, refrigerating engineer and architect, who designed the Ives plant and equipment.

The floor plans illustrated in this article were necessarily influenced by the adjacent old plant which contains the packing floor, loading platforms for both country and city deliveries, each separate, with the shipping clerk's office between them, the large loading sheds for packed trucks, loaded the night before for early morning start, the ice storage and general storage on second floor of these buildings. Nor do these plans show the ice manufacturing plant building, the pump house fifty feet high, three stories, for deep well pumps, water softener and water tank, the transformer building for electric power, required because two 150 H. P. and two 75 H. P. motors driving the refrigerating machines, operate on 4,000 and 2,300 volt current. The whole plant covers one block long and one-half block wide, and a description of the old plant machinery is a story in itself, but explains why some essential features are not shown in plans.

The new addition here illustrated, containing the ice cream manufacturing department is 117 x 117 feet—three stories. The adoption of the so-called spout or hopper system, the fact that the driveway and platforms for receiving raw materials are on the second floor levels on west side and the old plant to the rear as above described, determined the general layout.

The cream, milk, sugar, etc., are unloaded at receiv-

ing room on second floor level, elevated to third floor placed in storage ready for operations.

In this plant most of the pasteurizing and mixing is done at night, because the cream arrives in the late afternoon, and is run direct from trucks to the weigh tanks in mixing room on third floor, direct to the pasteurizer tanks, where all ingredients are put in, then direct to viscolizer, located on second floor, by gravity, viscolizer lifting this mix to the surface cooler on third floor. A sanitary pump there lifts it to the holding tanks, located on the third floor.

At the weigh tank the empty cream cans are run over a drip saver and gravity conveyor to the can washer shown in can storage room on third floor. The clean cans are here stored and taken down the elevator and trucked to stations, as required.

Note on the third floor plan the proximity of cream and sugar storage to the pasteurizing tanks, tops of which are level with floor, from the standpoint of labor saving.

From the holding tanks the mix has a gravity flow to the freezers, on the second floor below, from the freezers into the hoppers and spouts to the filler room on first floor.

Special attention was given to the freezers and their equipment, with the already proved result, shown by charts, that seven to eight batches per hour are obtained with no greater amount of power and refrigeration than were required with the same battery of freezers in the old plant. The Willman control machines were installed, as shown on the view of the freezer room, and the results obtained, combined with the ample volume and low temperature brine, was a revelation to the writer and demonstrated that the freezing equipment of most plants throughout the country are working at about fifty per cent efficiency. The inventor of these control machines has built a real milestone on the progressive highway of the ice cream industry. The power control of the freezers are handled by push buttons attached to them, with magnetic switches placed in the adjoining carton storage, thus displacing the usual and objectional location of switches in the freezer room.

Descending to the filler room on first floor. The bulk cream from the three hoppers and spouts, served by the six 80-quart freezers above, are run to one filler valve where the cans are filled, shoved onto the power conveyor, and slid through the small doors into the hardening rooms. The package filling machine is served by three separate spouts and hoppers from three 40-quart freezers, located in freezer room above. For filling slabs or tins, still necessary for making special orders of bricks and for slices, the packaging machine is pushed aside and a table of proper height is placed under the spouts.

The view of the filler room shows the arrangement of the package machine, the chutes for the cartons and covers to each end of the machine, where they belong to provide continuity of operation without interference. This view also shows the other machinery for cutting dipping and wrapping slices and bars.

Any reference to the hardening rooms is unnecessary, except that it will be noted that vestibules were omitted. The usual wet and ice covered doors in vestibules, door interference, space required and extra time consumed, do not justify their use in some plants, and do not offset the refrigeration they are supposed to save. The rooms in this plant are well insulated with sheet cork and equipped, according to the most efficient practice, with direct expansion pipe coils and can sliding arrangement.

VIKING—The Practical Pump

For pump users who demand dependability and economy of operation.

The VIKING is self-priming and delivers a steady stream under varying heads. This eliminates all splashing and pounding.

Only two moving parts—no valves, springs or other trouble-makers.

Get the Viking catalogue. It's yours for the asking.

First floor packaging room. Eskimo Pie machine in foreground, capacity 300 dozen per hour. Automatic Brick machine, capacity 900 quarts per hour. Bulk filling spouts in rear.

Trade Notes on Coming Dairy Exposition

Advance Tips from your Friends the Exhibitors as to Some of the Things to be Seen at Syracuse

Although the ammonia type of freezer is comparatively a recent development it has rapidly grown in popularity, according to officials of the Creamery Package Manufacturing Co., who say a large number of them have been installed in various parts of the country. They will be exhibited in booths 166 and 167 at the Exposition.

The first few machines put out, officials say, were crude as compared with the perfected ammonia freezer of today. However, the faults of the early types were soon eliminated and the present model of Progress ammonia freezer which has been on the market for about two years, has given universal satisfaction when properly operated, it is claimed. Contrary to the belief of some, according to this company, it is not difficult to operate the Progress ammonia freezer.

In fact, a statement from the company reads: "There is one battery of them being operated by a boy of twelve years old. Of course a few simple instructions must be followed to secure the best results, but it is easier to learn to efficiently operate this freezer than it is an automobile. Once the machine is set in the morning it will turn out batch after batch at the rate of from 6 to 10 per hour with no attention all day long.

"It is not pretended that the ammonia freezer will displace the brine freezer—in fact, each freezer has its place and will doubtless continue to have, but the concern which does not have a surplus capacity of brine and yet wants to add more freezers, will find the Progress ammonia freezer one that is ordinarily suited to its needs. It is also an ideal proposition for the concern who wants to start up with one or two freezers, for no brine, brine lines, brine pumps, nor brine boxes are necessary."

Another advantage claimed for the ammonia freezer is that it eliminates the waiting for the brine to get cold in the morning, before freezing can start. Freezing can begin just as soon as the factory is opened and will continue to freeze on regular schedule all day long, it is declared.

* * *

Stout Manufacturing Company.

The Stout Manufacturing Co., of Milwaukee will exhibit a new brick cabinet at the Dairy Show. This new Self-serving brick cabinet is characterized by the Stout Company as a radical advance in point of convenience in handling brick ice cream of several kinds in the one cabinet—"an innovation whose necessity has been constantly stressed by both ice cream manufacturers and dealers." The cover of this cabinet need never be opened except for filling, officials say. Bricks are removed mechanically from the bottom.

This new cabinet will be up to the usual standard of insulation and general construction claimed for Stout-Schroeder perfection cabinets, while the mechanical features will be simple to operate, "and afford a convenience in dispensing the various flavored bricks that will make this self-serving cabinet instantly popular."

This new cabinet, together with its regular line of high grade bulk or brick cabinets and cedar tubs will make the Stout exhibit, well worth making special note to visit, officials believe. It will be found in the State Institution, Building alongside that of the Milwaukee Dairy Supply Manufacturing Company.

* * *

C. E. Rogers.

This firm has not notified The Ice Cream Review concerning its exhibit at Syracuse, but it has reserved space and will have representatives present to welcome visitors.

* * *

Emery Thompson Machine and Supply Co.

We have not been advised as to this firm's exhibit, but they have made reservations for space, and visitors are sure to find theirs an interesting booth.

* * *

Torsion Balance.

This firm's ice cream overrun scale will be exhibited at Syracuse.

* * *

The Vilter Manufacturing Company will exhibit ice making and refrigerating machinery at Syracuse.

Sealright Co., Inc.

This company will occupy booths Nos. 65, 66, 67 and 68 at Syracuse. In addition to its products for milk dealers, will have Sealright containers for ice cream, Sealright filling machines and other Sealright products. The booths will be in charge of Dr. Wilbur L. Wright, president of Sealright Co., Inc., and E. W. Skinner, vice-president and general manager, will be on hand, as also sales representatives from various sections of the company.

* * *

McCormick Co.

Officials advise that they will exhibit at Syracuse a number of dairy and ice cream plants through the medium of photographs, as well as display "such other technical data as will interest men contemplating building such plants will attend the dairy show. William D. McCormick and K. Anderson will represent the company in booth No. 69.

* * *

John W. Ladd Company Exhibit at National Dairy Exposition

This firm will exhibit viscolizers in capacities from 8 gallons per hour down to 50 gallons per hour. The Junior (50-gal.) machine is being exhibited for the first time. In addition to stock machines, the company will exhibit a 30 gallon capacity viscolizer with sections cut out, thereby showing the operation of every working part.

There also will be exhibited Rogers' automatic ice cream brick makers for packaging ice cream direct from freezer in one, two or three flavors. Standard, motor drive, and Junior, hand-operated, machines will be on exhibit.

The company will be represented by John W. Ladd, H. Harwood, C. F. Smith and W. G. Mason, and the following salesmen will be present: A. Drysdale, R. J. Ellwanger, D. G. Kercher, H. A. Drennan, G. W. Rohrbeck, C. A. Groves, M. Conaton, Jr., E. C. Hanna, B. C. Stroud, R. R. Cunda, N. J. Kestner, C. B. Hood, R. G. Gay, H. S. Mesloh, H. Sherman, J. A. Hamilton, R. Anthony, L. T. Moore, W. Petty, R. Strachan.

* * *

Solar-Sturges Co.

This company promises an attractive exhibit. Visitors are assured of a cordial welcome.

* * *

The "400" Products representatives will be among the present. They expect to see many of their friends.

* * *

This company will exhibit its new 100-gallon vertical pasteurizer, connected with milk pump and cooler; triangular packer for Sealright containers; New York State Board of Health two-compartment weigh cans with covers and starter; small special tinware; O. & B. electric-welded ice cream can; various sizes of cheese hoops and New York pattern sanitizing vat. Officials also expect to show some patterns of the O. & B. brine freezer.

* * *

James Leffel & Co.

This company's exhibit will be located in space 171, in the main machinery building. The exhibit will consist of a 20 h. p. A. S. M. E. code, internal fired, return tubular Leffel Scotch marine type of boilers on skids.

* * *

Rice & Adams Corporation.

At the Rice & Adams Corporation exhibit the following representatives will be in attendance:

Charles S. Adams, Orlando Adams, Willis C. Stephens, E. R. Alling, John W. Charlton, Walter B. Prescott, Geo. McFadyen, F. B. Cyr, L. F. Hatch, L. T. Calhoun, Frank W. F. R. Maw, Carl Ulrich, J. H. Constantine, and Wendell Radley.

An extra large space has been engaged in order to give the visitors adequate accommodation to make the exhibit the headquarters; and at the same time, officials say, to show an enlarged line of: Milk bottle cases, fillers, cappers, washers and sterilizers, together with milk can washers, sterilizers and driers. The new strip bottom crates and rotary filler and capper will also be featured.

(Continued on page 11)

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

BARBER

Everything for the Dairy Industry

You Get a Smoother, Richer Feeling Cream with The Viscolizer

The butter fat in the cream is finely divided by the action of the Viscolizer and united firmly with the filler, the sugar and the gelatine. These ingredients remain united in the freezer, resulting in smooth, rich-feeling cream.

A fine quality cream may be developed from sweet butter and skim-milk, or skim-milk powder. The Viscolizer unites the solid ingredients so that the butter fat will not separate while standing in the can or bottle.

The Viscolizer is furnished for either motor or belt drive—in five sizes, to meet the needs of any plant, large or small, capacities 100 gallons to 800 gallons per hour.

The Viscolizer is widely used also to improve table cream, for making ripened cream, for breaking up the fat in evaporated milk so it will not separate, for emulsifying oils, vegetable mixtures, salad dressings, fruit liquids, etc., and for various uses in the drug and food industries.

Boosting Winter Consumption Occupies Thoughts of Southern Ice Cream Manufacturers

Early Interest Indicates "All-Southern" Attendance at Little Rock

BOOSTING winter consumption is a matter uppermost in the minds of the Southern ice cream manufacturers. It will come in for much discussion at different Southern conventions, it seems evident. Scarcely had the first frost bite made its appearance on the pumpkin when supplymen traveling the Southern states began reporting to us that manufacturers in their territory were talking winter sales stronger than ever.

There seems to be no doubt that this matter will be earnestly engaged. Our friends in the South have done some splendid work in the advancement of the ice cream industry in recent years. They are just now at a point where they can get in some very effective work.

MUCH disappointment has been felt below the Ohio river over the winter status of ice cream, but it must be considered that the manufacture of ice cream as an industry is very young in that territory, and also co-operative effort is still in its infancy. The Southern Association of Ice Cream Manufacturers is entering upon its eleventh year as an organization, but it was not until last year that the association had gained sufficient support to do any serious work toward developing the Southern industry's opportunities.

NOW it is much different. The New Orleans convention seems to have marked the turning point. It was fitting that it should have done so.

It was at New Orleans that the association was organized. Results of the convention held there last year, eleven years after the organization meeting, were most satisfying—particularly gratifying to all hopeful for the upbuilding of the South's ice cream industry through co-operative effort.

BUT even now the Southern association has not the support to which it is entitled. It is gradually coming to it, but every man identified with the trade in Dixie should leave nothing undone toward boosting

its membership. Virtually every state in the Southeast is represented, but there are yet too many Southeastern manufacturers who "don't find time" to take in the conventions.

Two years ago, at the convention in Atlanta, disappointment was felt over the lack of interest by manufacturers in the Southwest. Accordingly, the decision was reached to visit "the boys over the river." It was then agreed to meet at New Orleans. And now the convention again is to be held west of the Mississippi.

This should result in attracting many new members from Oklahoma, Texas and Arkansas, although the latter state has been supporting the association nobly in the past.

YES; there's a reason to expect something good to come of the present urge toward increasing winter consumption in the South.

The spirit of Southern ice cream manufacturers is well summed up in an excerpt from a letter from that splendid gentleman and able business man, J. D. Kinnett, head of the Kinnett-Odom Company, Macon, Ga., and president of the Georgia Ice Cream Manufacturers' Association. Mr. Kinnett told us that he was getting ready to go to Cleveland to "find out who is selling more ice cream per capita than we—and how."

SECRETARY J. W. CLOPTON, in addition to his other stupendous efforts in preparations for the convention in the South, now is waging an intensive membership campaign. He is scouring the highways and byways from Virginia to Texas. There is no doubt that this will be extremely productive. It is no court secret that "J. W." is a very efficient and capable secretary, one of the very best in the entire industry. In the first place he is an excellent business man, his business at Decatur, Ala., being most ably and efficiently directed. Added to this native ability are such intense loyalty to his section, love for his industry and good will for his fellow manufacturers that make his work speak high to men who understand merit.

That's a point that must come in for earnest discussion at Southern conventions this year—how it is done. There are many different ideas upon the subject. They must be brought out and applied.

IATS off to the boys down in Old Kentucky. Truly the sun shines bright for manufacturers in the "Blue Grass" state since the success of efforts to launch organization of ice cream manufacturers. Neil Mortenson, mogul of the Dixie Flyers, and John Kloecker, director in the Southern association, started the ball rolling. It ended in a series of meetings which brought out a good, sturdy, smoothly running organization. The Kentuckians have celebrated their success by sending eighteen applications for membership to the Southern association.

This achievement reveals the secret of Brother Kloecker's strong fight to win the 1923 convention for his home town, Lexington. He was even then working toward a Kentucky association.

This now brings up interesting speculation as to where the 1924 Southern convention will be held. Birmingham is reported to be bidding for it. Birmingham has already been host to the convention and acquitted itself nobly.

But Lexington may have something else to say. John Kloecker now has reinforcements—eighteen new voting members.

SOUTHERNERS are getting ready for the national exposition. Special trains will run from different Southern points. There is much interest felt in the exposition in the South. Rumor has it that the Southerners are hoping for honors from the National Association of Ice Cream Manufacturers. There never has been a Southern official in the National Association. One reason is, the association's membership is so small in the South. Men in Dixie who most strongly support the association argue that is only the more reason why there should be a Southerner among the national officials—to stimulate interest in their section.

There certainly is excellent official material in the South—M. J. Costa, W. W. Campbell, C. A. Kent, George White, A. E. Dixon, J. D. D. Kinnett, Fred Scanlin and Wm. Sidebottom. That's only a few; there are others.

But official honors or not, the Southerners are headed north strong. They will help make the convention exposition a great success.

SOME ice cream manufacturers intensely interested in the two great national events for the dairy industry are wondering how they can attend both. One gentleman writes us that he just cannot make up his mind. There is an interval of ten days between the dairy show and the National Ice Cream Exposition. He wants to know what he can do with the extra week

that would be on his hands should he go to the dairy show and wait for the ice cream exposition.

Of course, it would be nicer for the delegates if it were arranged so they could leave the dairy show and go straight to Cleveland to pick up the string again, but this would never do for the manufacturers exhibiting at both shows, some of whom have very heavy machinery to handle, which takes time.

The man who lives too far away from Syracuse to return home and check up on his business before going to Cleveland would do well to have someone in his organization make one of the trips while he makes the other. Both events are extremely educational, and the main thing is to have your organization get the benefits of both.

ARKANSANS are getting "all het up" over the coming convention. They have a right to be. They wanted the honor, and now they mean to make good. About the most disappointing thing in the world, next to being dressed up and no where to go, is to be all prepared for company and then have the company call off the call, so to speak.

That's what happened two years ago. Arkansas was getting ready to entertain association delegates at Little Rock. The city had been selected and just when everything seemed to be all set, along came the Southern regional exposition of The Association of Ice Cream Suppliers in Atlanta, and the ice cream manufacturers were attracted to the Gate City. And in Arkansas things were off again, Finnigan. But things are on again now and Arkansans are proud and happy, like the good sports they are.

And the folks who think the visit to Little Rock will not be as nice as the one at New Orleans, just don't know anything about how they can entertain company in that hospitable town. They are genial souls, are the friends of Bill Terry, E. A. Watson and G. A. Meyer, and this will be amply demonstrated in December.

The trip to Hot Springs, alone, will be a wonderful affair. Hot Springs is a beauty spot of international renown. People from far parts pay good money—big money—to visit that place.

When it is considered that ice cream manufacturers of the South have the opportunity to attend a mighty good convention and at the same time spend a day in fun and frolic at Hot Springs—all on one ticket without extra cost—the Southern convention looks like a very good investment. Gentlemen of Dixie, that's some of the best mileage you will ever buy.

FIVE Dixie associations have set their convention dates. The Southern meets at Little Rock December 4, 5 and 6, and the Arkansas association will meet at Tulsa November 21, 22 and 23, the Texas association at Galveston, November 26, 27 and 28, and the North Carolina association waiting until after the holidays to hold its pow-wow at Winston-Salem January 15 and 16.

Hot Springs Excursion to Feature Southern Convention

Dixie Manufacturers Will Visit Arkansas' World Famous Beauty Spot

INDICATIONS that the Little Rock expedition will be one of the most interesting and entertaining ever taken by delegates to a Southern ice cream convention are well in evidence with the advance shaping up of convention plans.

In last month's issue The Ice Cream Review told, exclusively, of Secretary Clopton's plan for convention "stunts," and now it seems sure that these features will go over fine.

But Southern association officials are not content with just a little fun in their undertaking, and early last month The Review was advised that arrangements have been made for the delegates to spend one day of the convention at Hot Springs, the famous resort.

All the business of the convention, according to present plans, will be transacted on December 4 and 5,

with the Hot Springs trip coming as the grand finale on December 6.

The beauty of the Hot Springs trip is, it can be taken without extra cost, arrangements having been made for delegates to buy excursion tickets direct to Hot Springs, with stop-over privileges at Little Rock at the same price that a ticket to Little Rock would cost.

Arrangements have been made by Secretary J. V. Clopton for a special Pullman over the Missouri-Pacific Railroad from Little Rock to Hot Springs. Delegates to the convention coming by way of St. Louis and Memphis have been asked to travel over the Missouri-Pacific Railroad.

The schedule has been arranged so delegates can leave Little Rock the morning of December 6 and return from Hot Springs that night.

* * * * *

Officials Drive to Make Little Rock Convention Great "All-Southern" Gathering

IN this issue of The Ice Cream Review, Secretary Clopton calls upon the Dixie Flyers to assist him in one of the most ambitious membership campaign ever undertaken by the Southern Association.

It is sure that Neil Mortensen's faithful band will enthusiastically respond to that call, and there is little doubt that the convention at Little Rock will be marked by the most representative gathering of Southern ice cream men. It has been felt for some time that not enough of the South represented in the Southern Association of Ice Cream Manufacturers.

Mr. Clopton now is going after the stray manufacturers with a vengeance, scouring the thirteen Southern states in this undertaking. He is waging his membership campaign through the mail and wants the Dixie Flyers to see that the importance of association membership is impressed wherever they go.

The membership slogan is, "A convention delegate from every Southern state—and lots of 'em."

So be it.

* * * * *

Southern Ice Cream Exposition to be Held

ANNOUNCEMENT that the Dixie Flyers will repeat its exhibition features of last year will be received with much gratification by all who attended the New Orleans convention.

The Hotel Marion, it is announced, is well equipped to handle a very elaborate exposition, and officials of the Dixie Flyers now are making preparations accordingly.

E. A. Watson, president of the Arkansas Ice Cream Manufacturers' Association, and head of Watson & Son, Little Rock, is in charge of the exposition space. Firms interested in displaying their goods before the Southern ice cream manufacturers should get in touch with Mr. Watson.

* * * * *

Convention Program Not Complete

ALTHOUGH officials of the Southern Association of Ice Cream Manufacturers have not completed the program for the 1922 convention, it was announced to The Ice Cream Review in September that two speakers had been assigned places on the program.

Prof. A. C. Baer, Stillwater, Okla., will address the convention, as also Earl W. Hodges, head of the Public Utilities Commission, Little Rock, and formerly secretary of state for Arkansas.

Mr. Hodges has been active in the advancement of the dairy and ice cream forces of his state, and is expected to deal with things affecting the industry in the state. He is widely famed as an excellent speaker.

Prof. Baer is widely known to members of the ice cream industry for his answers to problems of ice cream manufacturers through the columns of The Ice Cream Review.

September 17th, 1923.

To the Members of the Dixie Flyers:

According to all reports, you are now finishing up one of the best seasons you have had for a long time. The ice cream manufacturers throughout the South have enjoyed a good business this year, and you, of course, have gotten your share of their supply business.

Convention time is almost here again, and I am now asking that you put forth a special effort to line up those manufacturers who are not members of the Association. They will make you better customers next season if they place their membership with the Southern Association.

In checking my membership list I find a number of manufacturers who for some reason have never placed their membership with the Association. You can render us a special service by getting these fellows lined up. We want every manufacturer in the following states as members of the Southern: Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, Oklahoma and Texas. All arrangements are now under way for the biggest convention in Little Rock, Ark., on December 4-5-6th we have ever had. The last day will be spent on a pleasure trip to Hot Springs, where special entertainment will be provided.

Exhibit space has been arranged for in the Marion Hotel, and you may secure same by getting in touch with Mr. E.A. Watson, Little Rock, Ark.

Remember, we are depending on you to send in at least two applications before convention time. You need not bother to get the money - just send in the name and address, stating that they wish to take membership.

Yours for results,

J. W. Clifton
Secretary.

ELEVENTH ANNUAL CONVENTION, LITTLE ROCK, ARK.

December 4, 5, 6, 1923

Eat Ice Cream Every Day--It's A Health Food.

Be sure you attend the Southern Convention, December 4, 5 and 6.

Little Rock "The City of Roses"

LITTLE Rock ice cream manufacturers are receiving the wholehearted co-operation of other ice cream manufacturers of the state in their efforts to make the Southern convention an outstanding success, and everybody in the state is looking forward to showing visiting ice cream men a delightful surprise, for one of the most interesting cities in the South is to be host to the Southern Association of Ice Cream Manufacturers on December 4-5-6 next, when the delegates assemble in annual convention at Little Rock, Arkansas.

Little Rock, known socially as the "City of Roses," and in business circles as "Prosperity City" is the metropolis, in every sense of the word, of Arkansas, "The Wonder State." Way back in the old days when the divine right of kings was taken seriously and prohibition was a heathen superstition, Little Rock was "Petite Roche," a pleasant and profitable rendezvous for the early Spanish-French voyageurs and traders, who dashed up the Arkansas River in birch-bark canoes and boot-legged imported cognac for buffalo skins and White River pearls. A canoe-full of the same merchandise will go a long way in Little Rock today, indicating the steadiness of the market at that favored point.

Excellently located in the center of a great and prosperous territory, unexcelled in agricultural, industrial and mineral resources, Little Rock is a trade center which is growing very rapidly. Arkansas is just beginning to touch the edge of her industrial development but already Little Rock is of distinct importance in this field. Great mills and factories border the city on the north and east, employing thousands of workmen and turning cotton, timber and other Arkansas products into hundreds of commercial articles. With the completion of the six great hydro-electric power dams now building on the rivers of the state, ap-

proximately a half-million horse-power of the cheapest and most efficient industrial energy known will be at the service of Arkansas manufacturers.

The keynote of Little Rock's business life today, however, is not manufacture but trade—the wholesaling, jobbing and brokerage trade. Through skillful development of its natural advantages and excellent railroad connections, Little Rock is the chief purchasing and sales agent for Arkansas. It is the pivotal point for two million people—to which the manufactures of the North and East are gathered for distribution over the state and through which most of the trades are made which pass on to the outside world the varied products of Arkansas.

Conventions are no new thing to Little Rock, ninety state, district and national gatherings having been held in the convenient and hospitable "City of Roses" this year, which is about the average. Little Rock has an established reputation as a warmly hospitable Southern city with a strong co-operative community spirit and a loyal home-town feeling which prompts its citizens to show visitors the best the city has to offer.

Steadily growing with its parent territory, the great Mississippi Valley, Little Rock has steadily increased until today, we find it a city of 100,000, lying on both shores of the broad Arkansas River, which it spans with five arching bridges. From the scenic point of view, the city is admirably situated, offering the pleasant contrasts of the flat, fertile "bottom-lands" watered by placid bayouts and shaded by giant trees, which lie to the east and south to the rugged, tumbling foot-hills of the Ozarks, which lie to the west and north of the city.

Visiting ice cream manufacturers will find headquarters at the Marion Hotel, an excellent metropolitan hostelry of five hundred rooms, famous as a convention headquarters.

* * * * *

Arkansas Manufacturers to Meet December 3

THE Arkansas Ice Cream Manufacturers' Association will hold its annual convention December 3, one day before the Southern association gets in action. The Arkansas convention, of course, will be held at Hotel Marion, Little Rock, and Secretary G. A. Meyer of Stuttgart calls upon his membership not to

lose this opportunity of taking in both their state convention and the Southern convention at the same time.

The Arkansas convention will be in the form of one business meeting. It will be called to order at 1 o'clock the afternoon of December 3. Members have been asked to make reservations through the president, E. A. Watson, Watson & Aven, Little Rock.

* * * * *

Oklahoma Association Names Convention Headquarters

IT WAS announced in the preceding issue of The Ice Cream Review that the Oklahoma Association of Ice Cream Manufacturers had decided to meet at Tulsa November 21, 22 and 23. Officials recently notified The Ice Cream Review that Hotel Tulsa has been designated convention headquarters.

Secretary J. B. Porter, who will be host to the convention delegates, advises The Ice Cream Review that the season still was running about normal, and convention preparations accordingly had not been fully shaped

up. He is confident that Oklahoma will have its usual, lively, well attended convention.

Due to the fact that Claude H. Deroche, president of the Oklahoma Wolfhounds, has severed his connection with the ice cream industry, the part that the Wolfhounds are to play in the convention had not been fully worked out when Secretary Otis B. Wittee, Oklahoma City, wrote us a few days ago. Mr. Wittee, who is connected with the N. A. Kennedy Supply Co., is rapidly getting things shaped up, however, and he is confident that the Wolfhounds will be found "right on the job" when the time comes.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

PIONEERS

STURDY and fearless; by their intrepid determination in the face of many hardships, the pioneers in their covered wagons opened up a new empire in the West. Today a fair and prosperous country—modern cities—progress and development are monuments to their foresight and resolute purpose.

We, too, have been pioneers in our field of endeavor. For Gumpert's Ice Cream Improver was the first step forward in producing creamier, richer ice cream with a more delicious flavor. Ice Cream is now made with a full yield, a velvety smoothness, a finer taste when Gumpert's Ice Cream Improver is used. For this modern method overcomes the faults heretofore associated with the time-for-ripening process.

Over 2,000 of the most progressive and prosperous manufacturers in the industry use Gumpert's not only because it is profitable to do so, but also because it insures better ice cream.

Gumpert's *Ice Cream Improver*

Made by S. GUMPERT & CO., Bush Terminal, Brooklyn, N. Y.

Kentucky Organization Formed

ICE cream manufacturers of Kentucky have recently joined in with dairy interests in that state in a series of meetings, looking to the formation of a state dairy association. Success was formally signalized at a meeting at Lexington on December 4, when the Kentucky Manufacturers of Dairy Products was organized. It is composed of three divisions — ice cream manufacturers, creamerymen and milk dealers.

JOHN KLOECKER.

John Kloecker, director in the Southern Association of Ice Cream Manufacturers, was elected president of the ice cream men's division, with E. A. Voleamp, head of the Consumers' Ice & Creamery Co., Paducah, as president of the main organization.

Mr. Bell of Louisville, not previously connected with the ice cream industry, was elected secretary of the main organization.

This meeting followed one held at Louisville the previous month, when the Louisville manufacturers perfected a sort of get-

together-noon-day luncheon club, composed of local ice cream manufacturers.

As this issue of The Ice Cream Review was about to go to press, officials were making ready for another meeting, when further organization matters will be worked out.

The meeting last month was well attended. C. Mortensen, president of the Dixie Flyers, was on hand to pledge the support of his organization.

GEORGIANS PLAN TO ATTEND NATIONAL EXPOSITION IN A BODY.

The Georgia Ice Cream Manufacturers' Association is getting ready for its final quarterly meeting of the year as this issue of The Ice Cream Review is about to go to press. Sam Marshall of the Marshall Ice Cream Co., Albany, Ga., and secretary of the association, will be host to the members.

Plans will be formed for the association to attend the Cleveland Exposition in a body. Albany was selected for the fall meeting when the association met at Tybee Island, Ga., in the summer. At the Albany meeting the association will decide the time and place for its regular annual convention, which usually is held some time in January. Atlanta and Macon have been the most popular cities for the annual convention thus far, but officials think it likely that another city will be chosen this year. J. D. Kinnett, head of the Kinnett-Odom Co., Macon, is president of the association.

The Georgia association is one of the liveliest state bodies in the industry, and for the good work that has been done much credit must go to President Kinnett, past President M. J. Costa of Athens; Fred Scanling of Atlanta, and John Sancken of Augusta. They are gentlemen of high standing in national and Southern organization circles, being on hand for nearly every Southern convention and national exposition.

TEXANS DISCUSS CONVENTION PLANS

As this issue of The Ice Cream Review is about to go to press, the board of directors of the Texas Ice Cream Manufacturers Association is getting in readiness for a meeting at Galveston to map out a convention program. The call for the meeting was issued early last month, and at that time officials gave assurance that everything possible will be done to make the coming convention one of the most interesting and entertaining on record.

In addition to the officers of the ice cream manufacturers' association, the directors' meeting is being attended by J. B. Huff of the Prall-Huff Co., Fort Worth, Tex., and president of the Texas Longhorns. Mr. Huff will see how things shape up and proceed to enlist the services of the Longhorns in convention preparations to the best advantage.

The meeting was scheduled for Hotel Galvez, where the 1923 convention will be held November 26, 27 and 28.

Texas officials are highly optimistic over the outlook for a snappy convention, and they believe it will be one of the most largely attended of any they have held in recent years.

You can find the person who will be glad to buy what you wish to sell, by letting your desires be known through an advertisement in The Ice Cream Review.

The Value of Trade Marks to the Ice Cream Manufacturer

By M. S. MEEM*

RIGHT now when there is so much to be said about advertising, and methods of doing business generally, and our magazines are filled with fine suggestions from our readers, what shall we say about our TRADE MARKS? This is a subject we are all interested in, because we may be manufacturing and producing in enormous quantities, but if we cannot sell our goods, what is the use of manufacturing them? The public prefers to buy goods that have a familiar ring. Where would the "Annt Jemima" pan cake flour be today, if it were not for the old colored "mammy" whose face is familiar to all of us? It is the advertised goods that get the lion's share of the business, while the unbranded and unadvertised goods remain on the merchant's shelves; an eloquent memorial to a financial failure.

Let us call your attention to the advantages of and necessity of carefully selecting, and carefully protecting our trade marks.

It is remarkably easy to pick out a trade mark, sometimes a very catchy and attractive one, have some labels made and begin to use it on our goods. But, unless Wisdom and Prudence, the hand-maidens of Prosperity, have been displayed, we have very probably though unintentionally, appropriated some one else's trade mark, and may not find it out until many dollars and much valuable time have been spent in the exploitation of another man's property, and if we are very lucky we will escape the payment of large damages to the rightful owner of the mark.

* A member of the Legal Department of the National Trade Mark Company, Washington, D. C., writing especially for The Ice Cream Review.

We may manufacture a large amount of merchandise but unless we have a "selling" name, or trade mark, it is more difficult to bridge the distance between manufacturer and the purchaser.

In selecting a trade mark we should choose one that is appropriate to our goods. For instance, we would not choose "Mountain Maid" for citrous fruits, rather "Sunkist." By the same process of reasoning we would choose "Clover Leaf" or "Meadow Brook" for butter. Look what such marks as "Sun Maid" for dried raisins and "Velvet" for ice cream have done for their owners.

Now, having selected the mark, before doing anything else, submit it to trade mark lawyers, to those who specialize in trade marks and their protection. They will tell you whether the mark is objectionable in any way, and will carefully examine the trade mark records of the United States Patent Office, where nearly a hundred and seventy-five thousand trade marks have been registered, to see if the proposed mark has been anticipated by anyone else for similar goods, and advise you just what to do in case it has not been. In this country priority of use gives ownership to a trade mark, but "use" means application of the mark to a specific good sold or for sale in trade.

If you were buying a piece of land upon which erect your home would you not have the best lawyer you could find carefully examine into the title to the land? How much more important, even, is it that you should examine into the ownership of the trade mark you have selected? Your trade mark is the foundation rock upon which you expect to build your future business, and it should be as firmly laid as the foundation of the most important building in the country. Your trade mark is the selling medium provided for your product, and like any other true salesman it must be honest, pleasing, and attractive in appearance. Honest, in that it advertises a meritorious article; pleasing in that it is easy to pronounce and easy to remember, and attractive to the eye, because after all the picture represents to the eye is long and lasting, and by it, frequently good will is made or lost.

Registration in the Patent Office is one of the best avenues of publicity of a trade mark. Your registered trade mark is reviewed by every careful person who is seeking to adopt and register a trade mark, and the official examiner in charge before he allows any application in the same class of goods. Your filing in the Patent Office is prima facie evidence of ownership of your mark. That means if you are involved in controversy with a later applicant, the burden of proof is upon the latter to prove his claim first.

Furthermore, after you have selected a trade mark and intend to apply for registration, you may mark your labels you are having made with the legend "Registered U. S. Patent Office," or an abbreviation thereof, before filing your application, which is permitted by the Patent Office for convenience sake to the applicant, and which also serves to notify the public that you are seeking every means to protect your rights, and thus prevent subsequent adopters from imitating your mark.

If you are a corporation, and your mark is a prominent feature of your corporate name, you may have your corporate name as a whole recorded, following a ruling, and thus prevent a newcomer in the field from registering your mark for any class of goods.

If it happens that you have already adopted a

EXPOSITION EXTRA

1923 ..
Success
Plus!

Come to CLEVELAND, O. again OCTOBER 22-27 Page 1

NATIONAL ASSOCIATION OFFICERS ASSURE CONVENTION SUPREME; PRESIDENT, SECRETARY AND DIRECTORS ADDRESS THE INDUSTRY; SESSIONS WILL BE OPENED TO ALL ICE CREAM MANUFACTURERS AS BANNER NUMBERS ASSEMBLE FOR GREATEST OF ALL PROGRAMS

This issue of the EXPOSITION EXTRA is dedicated to the National Association of Ice Cream Manufacturers and the complete success of its 23rd Annual Convention to be held in Cleveland, October 22nd-25th, inclusive, and in conjunction with which is to be held, October 22d-27th, inclusive, the Second National Exposition of The Association of Ice Cream Supply Men. We believe that every ice cream manufacturer, whether a member or not of the National Association, should read, for the inherent interest in them, the messages from President Morris, Secretary Lowenstein and the directors and members of the National Association contained in this EXPOSITION EXTRA.

THE ASSOCIATION OF ICE CREAM SUPPLY MEN.

NATIONAL ASSOCIATION SECRETARY SUMS UP ORGANIZATION WORK

—
Presents Practical Convention
Program—Lists Association's Activities

By N. LOEWENSTEIN—
Chicago, Ill.—The 23rd Annual Convention of the National Association of Ice Cream Manufacturers to be held at Cleveland, Ohio, October 22nd to 25th, in connection with the Exposition of The Association of Ice Cream Supply Men, will be without doubt the most important convention that this Association has ever held.

The Program
The program is now in the stage of preparation, and the subjects to be discussed will be of the most up-to-the-minute ones, of the greatest importance to ice cream manufacturers, large and small. Every able speaker will make addresses and will be glad to answer all questions put to him in connection with their subjects. No doubt the many questions and answers put will solve some knotty problems confronting our members.

(Continued on Page 2, Col. 2)

CONVENTION FACTS IN BRIEF REVIEW FOR ICE CREAM MEN

Special Rates, Convenient Quarters, Record Making Discussions

The convention of the National Association of Ice Cream Manufacturers to be held in 1923 is its 23rd successive annual meeting.

It will be its largest meeting in numbers present and in the comprehensiveness with which they represent the industry.

Meeting Place

Its sessions will be in the auditorium of the Chamber of Commerce Building of Cleveland, fronting the famous Cleveland Public Square.

This Chamber of Commerce building is diagonally across one side of the Public Square, a distance roughly of two short city blocks from the Cleveland Hotel, the official headquarters for the Convention-Exposition week of the National Association.

Open to All

The sessions will be open not merely to members of the Association, but to all ice cream manufacturers.

(Continued on Page 4, Col. 4)

"One of The Pleasant Things About Conventions Is That They So Interlace Business, Social Contacts and Pleasure"
Says President Morris

IN HUMOROUS, PRACTICAL VEIN LOOKS FORWARD TO OCTOBER

Some Reflections on Supplies, and Names and Salesmanship Included, Too!

By CHARLES G. MORRIS

New Haven, Conn.—I like to do what is expected of me—though living up to other folks' expectations is often an impossible job—and I reserve, always, the right to do the unexpected. Without the unexpected, life would settle down into a mere humdrum matter of mathematical calculations concerning our fellow-men without any of the fun of wondering what they will do next.

A Snare? Well—

So, as The Association of Ice Cream Supply Men is getting out an EXPOSITION EXTRA

CHARLES G. MORRIS,
President, National Association of
Ice Cream Manufacturers

in which it is "expected" the officers of the National Association will appear by photo and written article, I'll be among the first to put my feet into their snare.

He Likes the Snarers

I like the Supply Men's Association. Some people turn up their noses at the fellows who have something to sell to them and act as if that fact was enough to make them disagreeable. Now I have had a life insurance agent sit in my office and try to sell me something after I had turned him down with courtesy and he wasted what seemed like hours of my time in general conversation—to say nothing of the strain of suppressed energy in my vain attempts to think of something that would move him. I confess that I rather liked his first attempt to sell me insurance. That was his business right. But when he mistook himself for a social caller, he was cutting my business right.

Some Selling Whens

But—to leave such a disagreeable subject—one of the best things of all about the Supply Men's Association is that its members seem to know when an ice cream manufacturer is busy and when he is not.

(Continued on Page 3, Col. 1)

They are known by

THE SEAL

OF SAFETY

TERMS: Have your name correct on the mailing list.

A BUSINESS DUTY

In dedicating an issue of the EXPOSITION EXTRA to the National Association of Ice Cream Manufacturers, The Association of Ice Cream Supply Men does so in the belief that every ice cream manufacturer in the country, great or small, owes it, first, to himself to participate in the benefits of the national organization of his industry and, second, owes it to that organization to support it with his energy and ideas.

Three years ago the President of The Association of Ice Cream Supply Men, in a statement to the industry, said that: "The ice cream manufacturer who does not join the National Association is—in my opinion—as negligent as if he failed to take out fire insurance policies on his plant."

Emphatic as this statement is, the experience of members of The Association of Ice Cream Supply Men through their own organization of the value of national associated effort confirms them in the belief thus expressed by their President that ice cream manufacturers are overlooking an invaluable opportunity to strengthen their own businesses and to advance their own industry as a whole, if they fail to avail themselves of the benefits of their own National Association.

SECRETARY OF NATIONAL ASSOCIATION LISTS ORGANIZATION'S WORK FOR INDUSTRY

Many Benefits Attracting Ice Cream Manufacturers to Membership in National Body of Their Business

(Continued from Page 1, Col. 1)

The convention will be open to all ice cream manufacturers, whether members of the Association or not, with the exception of the closed meetings, which are for members only.

Association's Advantages

If you are not a member we wish to impress upon you why

OPEN TO ALL

It is noteworthy that sessions of the National Association's convention in Cleveland are to be open not solely to members of the Association.

Any ice cream manufacturer or any executive of an ice cream plant who is interested in discovering better methods and gaining wider knowledge of the business, will be welcome to all except the final business session of the convention.

It is probably impossible to attempt to evaluate the results of a convention of this sort and of a policy of this sort to the industry as a whole. The national convention would be utterly impossible without the National Association. The National Association, however, does not limit the advantages of its convention merely to those men and companies whose support makes its existence possible.

It offers the opportunity to keep abreast with affairs in the industry to all ice cream manufacturers.

CONVENTION AND SHOW

Not the least, of course, of the opportunities which the Cleveland week will afford to ice cream manufacturers from all over the country is that of inspecting the Second National Exposition. Although this issue of the EXPOSITION EXTRA is devoted to the National Association's convention, insofar as the Second National Exposition is co-ordinated with the convention, it is proper to direct attention to the show's outstanding feature—that it will be the largest and most comprehensive ever held for the industry.

it is to your best interest to join the National Association and why you cannot afford, from a dollars and cents standpoint, to be without such membership.

Every live, progressive ice cream manufacturer will identify himself with this organization after he has given careful consideration to the following few of the many important reasons why he should do so:

Unity in Effort

Because it unifies and represents in a national way the constantly expanding ice cream industry.

N. LOEWENSTEIN,
Secretary, National Association of
Ice Cream Manufacturers

Because it bands together for mutual protection and advantage a large percentage of the manufacturers of ice cream in this country.

Because it keeps in constant touch with all important legislation—state and national—and takes prompt action in connection therewith where such action is required.

Express Rates

Because in the matter of express rates and service, the National Association is constantly on the alert to correct conditions inimical to the industry.

Because it furnishes to its members authentic information on all matters of importance to them.

Because it does for its members many of the things they would have to do for themselves, at their own expense, if

they would continue to and it does them at a cost and more effectively could be done by any individual concern. An outstanding example of this is the action afforded the industry during the war, when, as a result of the work of members of the Association, ice cream was classified as an essential commodity in the distribution of

Government Aid

Because all branches of Government are willing to operate cheerfully with associations, particularly those which represent, as in the case of the National Association, a large percentage of the industry. The instance of this Association's cooperation with the Department of Agriculture has been for some time and is now conducting research work on ice cream and is making important strides in its efforts.

The Association has about a dozen standing committees working on problems of the greatest interest, of which you will need to know the details. Members are kept informed on all these matters.

Healthy Growth

Because the fact that it serves its members efficiently is demonstrated by the growth of the National Association which has been in existence—no other organization will long survive unless it contributes materially to the welfare of its members. The growth of the National Association of Ice Cream Manufacturers is increasing day by day.

The Association of Ice Cream Supply Men has kindly volunteered to hand you a complimentary blank with this special convention issue of EXPOSITION EXTRA, which is dedicated to the National Association.

As the fiscal year of the association commences October 1st, dues paid now will be credited for 1924.

A form for making membership application to National Association of Ice Cream Manufacturers mailed with this EXPOSITION EXTRA.

Membership increase benefits the National Association and the industry as a whole.

PRESIDENT MORRIS WRITES OF CLEVELAND AND THE PHILOSOPHY OF A CONVENTION

Way of a Manufacturer With His Superintendent Comes In For Smiling Attention

(Continued from Page 1, Col. 4)

They sell you what you want when you are busy and they sell you what you don't want when you have lots of time to be persuaded about buying it.

The Exposition

At their Exposition—sounds like it is!—where you will get together to show just why everything that one of them sells is better for your purposes than any other one of them sells, has the charm of so complete that you almost unconsciously buy there machinery and equipment supplies that do make your business more profitable each than it has ever been before.

and the Convention

One of the pleasant things about conventions is that they interlace business, social contacts and pleasure that no one can feel grieved if their pleasure gets interrupted by business or their business gets interrupted by pleasure. That is where the pleasure is anticipated and becomes part of the expected. A nice set of contracts, is it not? But it is the reason why I like conventions.

Some Buying Whens

Of course you don't intend to do anything this year. You must attend the convention and play with the other ice cream men, and then those buying supply men will be just the one thing—or the other three—that you have not had a notion in the back of your head that you would do some day.

And Whys

Well, of course, next year you will discover that it has been for you not only enough for itself but also enough for your whole trip to the convention and the exposition. Of course you will grudge

the expense beforehand. Maybe you'll have some qualms of conscience just after you get home. But by the middle of the next summer you will be puffing out your chest before the superintendent and the foreman in your factory and saying,

A Mighty Moment

"I knew that was a good buy at the convention and you see how good my judgment was."

Of course you won't use just those words, but you'll see to it that the superintendent and the foreman get the idea. And really—if you will only confess it—you are just a little bit afraid of the criticisms that the superintendent and the foreman are apt to make of your purchases and you know it is good for them—as well as pleasant, distinctly pleasant, for you—to be able to take on that "I told you so" air.

Names and Faces

Yes, I like to go to conventions of ice cream manufacturers, though I do forget all the names of all the people I thought last year that I couldn't forget. That pains me—I hope it doesn't pain them as much as it does me!—and every year I plan and study so that I'll do better, because I'm beginning to learn from an experience of some fifteen years that I usually if not always do worse.

But what's the use of worrying? I'm going to that convention to enjoy myself and to learn as much as I can about the things my business needs.

"When We Meet in October"

That is reason enough for everybody who reads this article to forgive me if I don't name him as promptly as I intend to smile at him when we meet in October at the 23rd Annual Convention of the National Association of Ice Cream Manufacturers.

LUXURIOUS NEW HOTEL WILL QUARTER DELEGATES TO CLEVELAND CONVENTION

Comfort Unexcelled In Most Famous of Country's Hotels Will Be Ice Cream Men's

Members of the National Association of Ice Cream Manufacturers and other ice cream men throughout the country who will attend the Association's 23rd annual convention here in October will find themselves quartered in one of the country's most comfortable and modern hotels.

The Cleveland Hotel, official headquarters of the National Association of Ice Cream Manufacturers, is the equal in appointments, conveniences and general atmosphere of refinement and comfort, of the greatest metropolitan hotels of the country.

Regular Rates

Ice cream men's stay at the Cleveland Hotel will not, however, mean an extravagant outlay. Regular commercial rates will prevail.

A view of the tasteful mezzanine lounge in the Cleveland, where ladies may visit or rest, while orchestral music sounds from the main floor below

The Cleveland is this city's newest large modern hotel. It is situated on the Public Square in the heart of Cleveland.

The Cleveland Hotel

To Convention

It faces diagonally the Chamber of Commerce Building, in the auditorium of which will be held the sessions of the convention on Monday, Tues-

day, Wednesday and Thursday, October 22nd to 25th inclusive. It is a three or four minutes walk only—in the same direction as the Chamber of Commerce Building—from the hotel to the magnificent, six million dollar Cleveland Public Hall, both mammoth floors of

One of its several dining rooms is the Cleveland's famous basement grill room, where cuisine and service equal those of the most famous hotels in the country and an atmosphere of masculine ease prevails

which will be occupied by the Second National Exposition throughout the entire week of October 22nd-27th inclusive.

Other Conveniences

Some of the entertainment which, under the sponsorship of The Association of Ice Cream Supply Men will feature the week, with ice cream manufacturers and their families as guests, will center in the Cleveland Hotel.

From the hotel to the famous stores of Cleveland is barely more than a step. From the hotel to the many theatres is no further.

The management of the Cleveland reports that a small percentage only of its rooms remains unreserved for the convention-exposition week, several hundred ice cream manufacturers having already arranged for accommodations for themselves and, in some cases also, for their families and for groups of their executives, superintendents and stockholders.

Directors and Members of Nat'l. Association and Officers of Other Important Associations Laud Greatest Convention's Aims and Benefits

**W. F. Luick, Mrs. Vander Bie Babcock, J. W. Clopton,
Tell of Service to Individuals and
to Industry**

New York, N. Y.—Not only the President and Secretary of the National Association of Ice Cream Manufacturers convey messages concerning the annual convention in Cleveland to the ice cream manufacturers of the country through this EXPOSITION EXTRA, but numerous directors and members of the National Association also.

Ice cream manufacturers, in fact, throughout the whole country have endorsed, for many weeks, in unmistakable terms, the forthcoming Cleveland event.

A Message From W. F. Luick

William F. Luick, a director and member of the Executive Committee of the National Association—Mr. Luick is head of the Luick Ice Cream Co., Milwaukee, Wis.,—wishes to add his to the other voices that are foretelling the importance of the Cleveland event.

"The coming convention of ice cream manufacturers and also exposition of The Association of Ice Cream Supply Men," according to Mr. Luick, "should be of greatest interest to every manufacturer in the United States. Progress in this great industry of ours seems to be galloping forward year after year with ever increasing speed, and the manufacturer who wants to lead or hold his place must keep himself well informed on every step for betterment of product, increased efficiency in production, or economy in operation and delivery.

Value of Interchange

"The National Association through its interchange of ideas and the wonderful generous manner with which its members seem to delight in giving fellow members the fruits of their own conception which constitutes really the whole of the progress that has been made, has done more than any other one single thing to bring about the splendid advancement which is of benefit not alone to the manufacturer but to a very much greater extent to the consumer, as it has been the means of delivery to the consumer

throughout the United States of a continuously better product of what we now know to be a real food product of exceptional food value, and the increased consumption of which without any question has benefited the entire nation and particularly the children who really have required this additional consumption of milk product.

"There is just one place that this progress can be reviewed in an extremely short time and

W. F. LUICK, of Milwaukee, a director and member of the Executive Committee of the National Association of Ice Cream Manufacturers

in an extremely comprehensive manner and that is the meeting of the National Association of Ice Cream Manufacturers."

Mrs. Babcock Speaks

Mrs. A. H. Vander Bie Babcock, head of the J. C. Vander Bie Company Inc., St. Paul, Minn., a director-at-large of the National Association, is on record as follows—addressed to The Association of Ice Cream Supply Men recently:

"I have always enjoyed attending the national convention, but the enjoyment was mostly

due to the contact and association with other members, although I cannot deny the fact that I have absorbed much valuable information to be used in my business through the efforts of your Association in so intelligently displaying to ice cream manufacturers the necessities of the industry.

"I certainly had several reasons to congratulate you on the success your efforts brought you at the Cleveland Exposition last year and I can assure you of my intention to be with you again this year in body and spirit."

Southern Official, Too

J. W. Clopton of Decatur, Ala., Secretary of the Southern Association of Ice Cream Manufacturers, many members of which are likewise enthusiastic and active members of the National Association, recently told The Association of Ice Cream Supply Men:

"I do not hesitate to say that in my opinion the joint meeting of the National Association of Ice Cream Manufacturers and the National Exposition of The Association of Ice Cream Supply Men affords the ice cream manufacturer an opportunity to keep pace with the advanced methods of manufacture and to keep in touch with the modern machinery used in our business, to a greater extent than anything else that I can think of.

Attendance From South

"I believe that every manufacturer of ice cream should so arrange his affairs so that he can attend these meetings. I have already made my plans to attend the Cleveland meeting, and I hope it will not be necessary for me to miss a single meeting in the future. I find that I learn a great deal from my association with the manufacturers from all parts of the country.

"I feel sure that this year's convention will be the best ever

had, and I hope that the same, especially from the South, may be far better than has been heretofore. I expect to issue a trade letter very soon to the manufacturers through the ten Southern states, asking them to arrange to attend the conventions.

"If I can be of assistance to you, do not hesitate to call on me."

FACTS ABOUT THE TO READ AT GLA

Convention Data Condensed Manufacturers

(Continued from Page 1, C)

manufacturers and executives of ice cream plants.

The things most significant in the handling of ice cream businesses will be the things discussed at the convention.

Facts, figures, expert opinion, the ideas and suggestions of many minds will play upon and about the matters that concern the ice cream manufacturer in the daily conduct of his business.

Reduced Rates

Fare and one-half rate on all railroads have been granted. Ask the ticket agents, when you buy your ticket, for a collection certificate which will entitle you to return from Cleveland to your starting point at half fare.

Ice cream manufacturers fail to obtain accommodation at the Hotel Cleveland and four other modern, downtown hotels at their convenience. Hollenden, Statler, Olmsted and Winton.

Entertainment

Each day ice cream manufacturers and their families, whether members of the National Association or not, as long as they are registered, attending the convention and visiting the Second National Exposition, will be guests of The Association of Ice Cream Supply Men at various entertainments.

Ice cream manufacturers practically every state in the Union enjoyed the social enjoyment of last year's great Convention Exposition held in Cleveland.

Just A Moment Please —

THERE may or may not be Money in it.

You are thinking of purchasing a building that was constructed for some other purpose and remodeling it into a Dairy and Ice Cream Plant.

This may be profitable and again it may not.

Mistakes of this kind are costly.

If it is adapted to such reconstruction and you can get it at a low price — fine.

If it is not adaptable, then no price is low.

What is it worth to you? That is the whole question.

Better talk it over with McCormick Architects and Engineers. They can quickly tell you whether it is better business to remodel the old or build an entirely new plant.

Early Days of the Dairy Show

(Continued from page 46)

FROM THE MANAGER OF THE THIRD NATIONAL DAIRY SHOW.

A dairy show story without a message from A. J. Glover would fall far short of completeness. Mr. Glover was superintendent of the dairy cattle exhibit at the first two shows and was general manager of the third. He wrote the rules and regulations for the cattle exhibit most of which are still in effect.

A. J. GLOVER,
Fort Atkinson, Wis.
General Manager of the Third National Dairy Show. Held in Chicago in 1908. Editor of Hoard's Dairyman.

During the entire history of the show Mr. Glover has been associate editor and now editor of Hoard's Dairyman. He has been in position to render yeoman service in the movement and the files of his paper bear testimony of his loyalty to it. Mr. Glover says:

"The men who worked, often against great odds, to popularize the idea of a great dairy annual 'buildded better than they knew.' To have been one of the active

ones, especially during the early stages of the show's development is a satisfaction, and to continue to co-operate is a privilege.

"This great annual exposition of the dairy industry not only gives us all greater confidence in it, but it also dignifies the industry in the eyes of all the people. We are in a bigger, better business because of the National Dairy Show.

"It will continue to grow and advertise and dignify the dairy business. It will grow as the dairy industry expands and serves humanity. Inspired by an unselfish purpose and supported by big men in a big industry it will continue one of the big factors in developing American agriculture."

A VETERAN IN THE SERVICE.

When we attended our first director's meeting in Chicago, away back in 1907, W. B. Barney was there. He was a prominent Holstein breeder in Iowa and was a member of the board of directors of the association for many years. He was later dairy and food commissioner of the state of Iowa and is now Dairy Products Specialist in the Extension Service for the Holstein-Friesian Association of America. Mr. Barney responded to our request as follows:

W. B. BARNEY,
Chicago, Ill.

A Director for many years and always a booster for the National Dairy Show.

"I got my first notion of a dairy show when the Fat Stock Show was a yearly event at the old Lake Front Building in the early '80's. Smith & Powell, Syracuse, New York, and T. B. Wales, Iowa City, were exhibitors of Holstein-Friesians at this show. Dairy cattle were sort of a side line at the show. Aside from the above mentioned herds there were a few Jerseys exhibited, and some so-called milking Shorthorns. show. Aside from the above mentioned herds there were a few Jerseys exhibited, and some so-called milking Shorthorns.

"Later on no premiums were offered for dairy cattle at this show, and still later a committee, representing the dairy cattle associations, met with representatives of the International Livestock Exposition for the purpose of getting them to make classes for the dairy breeds. I represented the Holstein-Friesian association at this meeting. I was never very much in favor of such a combination and nothing came out of the conference.

"I felt that the time had come when the dairy industry was big enough and of sufficient importance to step out by itself and organize its own show.

"A few years later a number of us got together and perfected such an organization, and then our troubles started. I will not take you back or try to give you a history of all that happened in the first few years. Perhaps we were a little in advance of the times, but someone always has to make the first move.

"As I look back over the early years of the existence of this show I cannot but feel that James A. Walker, Ed. Sudendorf and A. J. Glover were among the men

Think This Over!

"People taste with their eyes
about as much as they do
with their tongues."

There is much truth in that statement, and it comes from a practical ice cream man who knows human nature. His success proves that.

who are entitled to a lot of credit for keeping the show intact until the industry developed to a point where it would support such an exposition.

"I am sure the development was much more rapid after the show was organized than before. As I see it, one of the great advantages in the way of development of the industry came by reason of a better acquaintance and closer affiliation of the men interested in the different dairy breeds of cattle.

"If the show has accomplished no other purpose it has easily been worth while on this account. I think I can speak advisedly as I well remember that before the show most breeders felt we had no common interest.

"It is my opinion that the show has, and is, doing a great work. If I were to criticise its management I should feel that it would be up to me to tell how to handle it better. If I were inclined to do this I would not attempt to do so in this short article.

"I have always felt that the show should have a permanent home in Chicago. I am very sure that expositions like the Dairy Cattle Congress, Waterloo, Iowa, and the Eastern States Exposition, Springfield, Mass., are going to be more numerous. In no way will they be detrimental to the one great show centrally located as it some time will be in a permanent home in Chicago.

"The development of this great industry in the last five or ten years has been so rapid as to insure the show a permanent and secure place as an important factor in the future growth of the dairy industry."

* * *

SHORT BUT TO THE POINT.

Probably no man is better known to the milk business on this continent than John LeFeber of Milwaukee.

He has been a leader for many years, not only in directing the affairs of the National Dairy Show but in different official positions in the International Association of Milk Dealers.

At home he is president of the Gridley Dairy Company, a big business institution that has grown from a small beginning under his direction.

Naturally he is a busy man. This alone might be a valid reason for the brief message which he sent us. But there is another reason, as his friends well know. He is a man of few words when forced in the limelight. Modesty is one of his virtues. When we asked him for an expression relative to the National Dairy Show he said a lot in these few words: "I regard the National Dairy Show as an American institution of world-wide importance, and believe that its management is in the hands of men who fully realize the responsibility their selection, as officers, implies."

* * *

FROM EX-GOV. FRANK O. LOWDEN.

Folks who have been so fortunate as to visit Sinnissippi Farm, just south of Oregon, Illinois, on the bank of Rock River, know that Hon. Frank Lowden, who was governor of his state a very few years ago, was a dairy governor. He couldn't be otherwise because of his interest in dairying. He not only operates a big dairy farm but owns several nearby farms which he has stocked up with his favorite breed. He writes:

"I have attended many of the National Dairy Shows and have never attended one without learning much of value to me as a dairy farmer and breeder. Its educational features alone are worth a visit from almost any distance. Aside from this, it is one place and the one time when all the various dairy interests come into contact with one another. This is for the benefit of all.

HON. FRANK O. LOWDEN,
Oregon, Ill.

A Director of the National Dairy Association. War Time Governor of Illinois and a National Figure in Politics.

This it is which enables one to realize that in the aggregate the dairy industry, taking into account the value

of the annual output, its important relation to health, its bearing upon the general welfare of the people, is really the leading industry in the United States. All indications point to the show at Syracuse, N. Y., as the greatest national dairy show in the history of the association. I hope that the attendance may be commensurate with the importance and value of the show itself."

FROM ONE WHO HAS ALWAYS BEEN THERE.

A dairy show without Hugh G. Van Pelt wouldn't be a dairy show. He is not only a regular attendant and worker at the "National," but he is the fellow who put the Dairy Cattle Congress on the map at Waterloo, Iowa. We are not going to try to tell you anything

HUGH G. VAN PELT,
Waterloo, Ia.

A Director of the National Dairy Association. Nationally famed Cattle Judge; President of the Waterloo Jersey Farm, Waterloo, Ia.

more about him. In the first place most folks know him or know of him, while in the second place if we were to attempt to tell about all his activities in dairying we wouldn't have room in this issue for anything else. Here is what "Van" wrote us:

"Having attended every National Dairy Show since the first one; having been vitally interested in its growth; having watched its development and having noted its favorable impression upon the dairy industry through the knowledge it has imparted to those who have been in attendance. I am impressed with the

fact that it is one of the greatest factors for good in behalf of those interested in dairying who will make use of it.

"In no way can one spend from one day to ten days so valuably in securing helpful knowledge pertaining to all phases of dairying as one can by spending such time industriously and thoughtfully at the National Dairy Show. This is an indisputable fact well recognized by all leaders in the dairy industry who realize

the importance of keeping up-to-date in order to succeed in their chosen work.

"The fact is that the National Dairy Show is the greatest annual visualization of all factors which go to make up the dairy industry, which is now and always will be the leading and the uniformly prosperous branch of agriculture.

"The tremendous growth the National Dairy Show has made in seventeen years illustrates its need and importance."

* * *

FROM AN EXHIBITOR AND A DIRECTOR.

The machinery and supply interests have always furnish the funds without which the National Dairy Show could never have lived. Through liberal purchase of space they have made the show possible. Walter L. Cherry, long a director of the National Dairy Association, has always supported the show liberally and consistently. Here is his message:

WALTER L. CHERRY,
Cedar Rapids, Iowa.

Director National Dairy Association
and President J. G. Cherry Company.

"As you know, I have been very closely in touch with the National Dairy Association and the National Dairy Show from the date of the first show. I certainly have had excellent opportunities to study the development of the show and to note its influence on the trade generally.

"I believe that the National Dairy Show is the greatest existing means for stimulating the production end of the dairy industry in all its branches. It seems to me that this was made evident by the effect

made by the National Dairy Show in the east, and particularly New England following the dairy show held at Springfield, Mass. I think it is evident to any close observer that the holding of the National Dairy Show for the last two years at St. Paul and Minneapolis has greatly stimulated the development of dairying throughout all of the Northwest. There isn't any question about

You can scare 'em away, too!

THE fellow in the picture has the right idea. When it comes to October's uncertain ice cream demand, nothing but a supply of Merrell-Soule Powdered Skimmed Milk can assure you your full profit.

Liquid milk is always a temperamental White Elephant, but you feel the strain more during the present days when it is so difficult to schedule ahead.

When you use Merrell-Soule Powdered Skimmed Milk you have complete control. This powdered

milk can be ordered the same as you order sugar and your supply keeps fresh for months without ice or handling.

Think of having a uniform grade of milk on hand—ready for any sudden ice cream demand—and yet keeping this milk in powdered form so there is no loss when a sudden lull slackens orders.

Best of all—you can guarantee the quality of your product when you use this absolutely uniform grade of milk.

MERRELL-SOULE Powdered Skimmed Milk
MERRELL-SOULE COMPANY, Syracuse, N. Y.

NORTH, EAST, SOUTH AND WEST—"REVIEW" IS LIKED THE BEST.

this, and the influence of these two shows is going to be felt throughout the Northwest for many years to come.

"I am confident that this year's show at Syracuse is going to have the same stimulating effect on dairying generally throughout the East and Southeast.

"The dairy industry is recognized as one of very great importance and we seem to have no difficulty in securing the fullest possible co-operation on the part of the press and all civic organizations wherever the show is held.

"As time goes on the show will doubtless be held in other sections of the country, which even now are waiting for this opportunity, and the ultimate effect in the way of stimulating the dairy industry is going to be of untold value.

"I wish the importance of this show could be fully realized by everyone whose business is in any way connected with the great dairy industry. Through publications like yours I think this interest can be built up and I trust that you will use your best efforts in this direction."

* * *

FROM DIRECTOR HOLLOWELL.

We asked J. D. Hollowell, a director, this question, "How can the show serve the industry best in the future?" and he replied as follows:

"You ask 'How can the show serve the industry best in the future?' I think it should be asked 'How can the dairy industry, which means the National Dairy

J. D. HOLLOWELL,
Chicago, Ill.

A Director of the National Dairy Show and always a Booster for it.

his other farm activities as a constant source of cash revenue?

Exposition, best serve all the people in the future?" For that is what it must do — serve all and not only the chosen few who are now engaged in the dairy enterprise, if it is to prosper.

"(1st) How can it best serve all the people that they may know more about dairying and the health giving properties of milk as a chief diet?

"(2nd) How can it bring this message closer to the grain, cotton, fruit and vegetable growing farmer that he may realize what the diversification of his crops

adding dairying to

"(3rd) How can it best function to bring the directly interested to see what is being accomplished in better breeding, better milking, improved and satisfactory methods of handling the products with improved machinery?

"The answer, to my mind, is to carry the message to all sections of this great country of ours by continuing, as we have in the past with splendid results, take the National Dairy Exposition—meaning the dairy industry—to them that all may see for themselves. seems to require about two shows, one following the other, in the same section of the country to obtain the best results. That has been fully demonstrated during the last two years when the exposition was held on the Minnesota State Fair Grounds.

"Syracuse or some place East should have the show another year. Then move to the Southwest, Kansas City or St. Louis, for two years. By that time one of the more Southeastern cities will be ready to house the exposition, either Louisville, Ky., or Cincinnati, O. The South is taking up dairying very rapidly and all that is needed is the National Dairy Exposition for two years to finish the job.

"In other words, my idea as to 'How best to serve the nation in dairy products' is to rotate in the holding of our annual exposition."

* * *

FROM PAST MANAGER AUTEN.

Visitors to the early dairy shows will recall the one where "Jacoba Irene," the great Jersey champion cow was exhibited in a box stall in the big arena in the

A. O. AUTEN, Chicago, Illinois.
1911 Manager of the National Dairy Show at the Coliseum, Chicago.
State Agent, Hartford Live Stock Insurance Company.

Coliseum. The owner of that wonderful cow was Mr. A. O. Auten of Jerseyville, Illinois, and for many years a member of the Illinois Board of Agriculture.

Mr. Auten was manager of the dairy show in 1911 and we know something of the trials and tribulations that he went through because we were right with him about 18 hours a day for several weeks.

We learned to love the man and to appreciate his sterling worth. Mr. Auten has been in live stock insurance work in Chicago for several years and doesn't look a day older than when he was actively con-

nected with the dairy show.

When we asked him for an expression relative to the dairy show he hopped right on the train and came to see us. In the course of our visit we asked him about that letter and he replied, "Now, Ed., you don't want a letter from me. You know I have always done all I could for the dairy show, but nothing I can say will interest your readers. Just tell them, if you wish, that I believe in the dairy show with all my heart and soul, and want to do everything I can in the future to help boost it.

We concluded right there that, in spite of the fact

that we didn't get a letter, we should not let the opportunity pass to give him the recognition, in connection with this story, that his services merit. Mr. Auten's many friends will join us in wishing him many more years of happy service in the industry he loves so well.

* * *

FROM THE INTERNATIONAL PRESIDENT.

The annual convention of the International Association of Milk Dealers is always held in connection with the dairy show. E. M. Bailey is president and is also a director of the National Dairy Association. We quote

E. M. BAILEY,
Pittsburgh, Pa.
A Director of the National Dairy Association and President of the International Association of Milk Dealers.

from his letter as follows:

"The biggest thing the National Dairy Show does is to make the dairy industry itself and the public in general realize that we are engaged in a business that can take a front seat when compared with any other industry in the world, either in the importance of its product or from a dollar and cents viewpoint.

"If every person engaged in the industry could be made to see and feel that he is a part in the greatest business in the world, the morale of the industry would increase by leaps and bounds and this is what we

need. I do not underrate the educational value of the show, but once we can make the people of the industry proud of their calling, the desire for education, better methods and better equipment will follow as a natural result."

FROM THE MAN WHO HAS CHARGE OF THE MILK AND CREAM EXHIBIT.

If anyone other than Ernest Kelly has ever had charge of the milk and cream exhibit at National Dairy Shows we have overlooked the fact. He never makes much noise, but he always manages to run his department successfully and harmoniously. He has during

ERNEST KELLEY,
Washington, D. C.
Mr. Kelley looks after the milk and cream exhibits at the show. Always pleasant and always on the job.

all these years been in charge of market investigations with the U. S. Department of Agriculture. When we asked him to give us his views relative to the show he wrote "The National Dairy Show has always seemed to me to be a wonderful combination of ideals and practicality. Ever exhibit, from the strictly educational booths to the display of cattle and machinery, present the very best that has been accomplished in the dairy industry. It does not require much imagination to look at such a display and see the wonderful possibilities which the future

holds for the industry. Not only does the show stimulate our pride in our industry by showing us the magnitude but also by showing us the wonderful accomplishments in quality, not alone in cattle but in the product as well. Such an insight cannot fail to be an inspiration to anyone connected with the industry; besides, it shows to other fellow what we are doing and the accomplishments we have made. In the words of George Bernard Shaw—

"I am ashamed neither of my work nor of the way it is done. I like explaining its merits to the huge majority who do not know good work from bad. It does them good and it does me good."

What Delft Has Done for Users of Gelatine

Do you remember the uncertain and unsatisfactory condition of the gelatine industry before Delft entered the field?

Compare it with present conditions, when every shipment of Delft Gelatine is accompanied by a scientific analysis of its contents; when every shipment is guaranteed free from harmful and liquefying bacteria when delivered; its color and clarity and strength **absolutely uniform.**

The example of Delft has been followed by others, resulting in the raising of standards throughout the trade. But the ideals which gave Delft its leadership will continue to keep it *the World's Best Food Gelatine.*

Harold A. Sinclair

FROM A PHILADELPHIA MILK DEALER.

Among the big men in the milk industry of the country is Mr. F. A. Wills, of the Supplee-Wills-Jones Milk Company of Philadelphia. Mr. Wills is a director of the National Dairy Association and the message

F. A. WILLS.
Philadelphia, Pennsylvania.
Director National Dairy Association.

which he sends to our readers is characteristic of the man. When we asked him for an expression relative to the National Dairy Show he replied as follows:

"The aims and purposes of the National Dairy Show are to further the dairy industry as a whole in all of its ramifications.

My conception of its possibilities, as well as that we are to build to the nth degree in our association, all that good science, all that good practice, and above all, an integrity that is unquestioned in our members, they in turn to pass this on

to those they live with, to those they do business with, so that when we are through with our life work the world will be the better for our having lived."

FROM THE AMERICAN ASSOCIATION OF CREAMERY BUTTER MANUFACTURERS.

The big meeting of the American Association of Creamery Butter Manufacturers has always been held in connection with the dairy show. The annual banquet has been a big feature and Secretary McKay has cooperated with the show management in every way possible. A letter from Dr. McKay reads:

"The National Dairy Show of this year will be of unusual importance

to everybody at all interested in the dairy business. In the biblical times it was the practice of the religious people to go to Jerusalem to tarry and get power. In late years it has become more and more a practice of the up-to-date creamerymen and dairymen to go to the national show to see the latest improvements that have been made along dairy lines and thereby gain a new inspiration. The manufacturer can go to the show and see the latest up-to-date improved dairy machinery that will save labor and make the work more efficient.

DR. GEO. L. MCKAY, Chicago, Ill.
Secretary American Association of Creamery Butter Manufacturers and a Dairy Show Booster During Its Entire History.

The breeders of dairy cattle can go there and see the best cattle of the different breeds that is found on the continent and thus get an inspiration to improve their dairy herds. What is true of the butter manufacturer is true of the ice cream manufacturer and the cheese manufacturer as well as the milk producer.

The dairy shows since the beginning have been of great benefit to the dairy industry, and this year the show should be particularly interesting due to the fact that the International Congress is to be held at the same time. In taking the show back to Syracuse, N. Y. this year, we are taking it back to the state where dairying first gained eminence in this country. The changing of the show from place to place is a good thing as it takes the best cattle in the country within reach of a great many people who are not financially able to travel from one end of the continent to the other.

other. In talking with the secretary of the Highland Show in Scotland, he stated that the great benefit of the Highland Show was that it was moved from place to place and sometimes to places that were really not financially able to pay the expenses of the show. But due to their financial condition they were able to do this. Such shows as the Highland Show and the English Royal has been the means of building up fine stock in the Kingdom of Great Britain, to such an extent that other countries look to that country for the best in live stock along all lines.

Therefore, everybody at all interested in dairying should boost the dairy show. Let us have a show at Syracuse this year that will surprise the delegates from foreign countries. As the United States is the greatest dairy country in the world, we certainly should have the greatest display of dairy products and dairy cattle and dairy machinery, which I anticipate we will have at the great show at Syracuse."

* * *

A VOICE FROM IOWA.

The National Dairy Show has always enjoyed the hearty support of the educational men. Their co-operation has had not a little to do in developing the educational appeal of the show. It is proper that these men

PROF. H. H. KILDEE,
Ames, Ill.

A Director of the National Dairy Association. Head of the Animal Husbandry Department, Iowa College of Agriculture. A noted Dairy Cattle Judge.

should have a representative on the board of directors. We asked Prof. Kildee, of Ames, to give us his impressions of the National Dairy Show and he replied as follows:

"In regard to my impressions of the National Dairy Show, will state that in my opinion, the National Dairy Show is the Mecca of all persons interested in the various phases of dairying. Not only is it the annual meeting place of men from all parts of the country who are interested in this particular industry, but it is a forum where opinions are expressed, ideas exchanged and many benefited. To the

dairy cattle exhibitor, the National Dairy Show is a court of final appeals. It is the bringing together of the champions from the different state fairs. The exhibits put on by the machinery men, the dairy products manufacturers, etc., constitute a 'pageant of progress' of the dairy industry."

BIG BUSINESS.

A man came in and asked if he could see the boss. They told him he would have to wait, that the boss was in conference.

"Very important," added the attendant.

"I know that," said the stranger. "I heard the cork pop."—Louisville Courier-Journal.

THE NATIONAL DAIRY SHOW AN ESTABLISHED INSTITUTION.

No organization among the many who have held their conventions at the Dairy Show has more loyal support than has the International Association of Milk Dealers. R. E. Little is secretary of this splendid organization and the following message from him is of special interest:

"As unto the bow the cord is,
So unto the man the woman—

R. E. LITTLE,
Chicago, Ill.

Secretary of the International Association of Milk Dealers, who has always supported the National Dairy Show "Heart and Soul."

"These two things, the National Dairy Exhibition and the great dairy industry who come to witness it, are or should be just as inseparable and just as interdependent and necessary to each other for economic progress in the dairy industry as the illustration at the head of this article."

"The National Dairy Show is an educational as well as an institution of entertainment. It is a telescope through which the milk dealer, the ice cream manufacturer, the butter maker and in fact all factors of the dairy industry for whom the show has been staged can get a long

distance view of the progress that is being made in the industry, and thus a liberal education, enabling them to prepare themselves in advance for such shows which in the course of human events must take place.

"The milk dealer, as a result of the great transition during the past two or three decades from a peddler of a somewhat lightly used article of food, has risen in rank, through a natural process of evolution, due to health, sanitation and the close co-operation with health organizations and a consequent demand of the consuming public for a highly and intensively specialized service, as one of the business leaders in the industries of the nation.

"The requirements of the service which he renders as a processor of his product make necessary an investment of capital with relative obligations to all industrial factors equally with the fabricator of any manufactured product. This means he must educate himself in all the material incidents of his business from producer to the consumer. It means that he must keep abreast of the times in order to accomplish the utmost efficiency and to exercise the greatest economy that enable him to meet the competition of his fellow.

"Production, fabrication, processing, selling and the numerous steps from the time the milk flows from the cow until it is placed on the consumer's door-step is in a constant state of change. New ideas, new inventions, new methods of doing business from every conceivable standpoint are ever and always in evidence.

"The advertising columns of his trade press, of course, keep him in a measure informed of these changes but the actual operation and the extent to which they can be or should be applied to his own problems can only be accurately and comprehensively demonstrated

EMBER—YOU ARE JUST AS MUCH A MEMBER OF THE ASSOCIATION NOW AS YOU WERE LAST WINTER.

either by actual test in his plant or by other visual demonstration. The former is impracticable in the majority of instances and the latter can best be obtained at a minimum time and expense through one way only and that is at a central point of exhibition and demonstration. To this extent the National Dairy Show comes forward and renders for the dealer a distinct and necessary service that he can obtain in no other way.

"The milk dealer, therefore, should feel that the National Dairy Show is a part of his own investment and that he himself should feel distinctly a proprietary interest in that institution. I have heard it remarked at different times, and I have no reason to doubt it, that the ideas and information gained at different times by the dealers at the National Dairy Exhibition have repaid them in actual dollars and cents many times over for the time and money expended in attendance at the show.

"This same feeling has also been expressed repeatedly and unqualifiedly with respect to our annual conventions. If this is true of each of these institutions, then the relation and interdependency between these several organizations must be conceded. The fact that they are held in the same city and at the same time enables the dealers, with one expenditure of time and money, to attend the sessions of both institutions which are admittedly in his financial interest.

"This argument is from a hard, cold dollars and cents viewpoint and has not taken into consideration the great opportunity for fellowship and communion one with the other in his same field and upon the problems of his own business.

"E. M. Bailey, president of our association, in his closing comments before the last annual convention, made these very pertinent remarks: 'Are any of the

old members sorry you ever attended any convention? Has anybody ever had a kick coming for attending convention of ours?' His inquiries were met with a large chorus of 'no's.'

"I am willing, and I think the other officers of the association as well, to frankly confess the fact that members had an opportunity to attend the Dairy Show and learn the latest things in their business, went a long way in dictating the sentiment that was expressed in that unanimous response.

"The gathering of the 'Clan' this year at Washington, Philadelphia and Syracuse will unquestionably surpass any demonstration of its kind that has ever been attempted. Every milk dealer in the United States and Canada, not forgetting our worthy members in London, England, owe it to themselves and to the business which they represent to make every possible effort to attend these sessions this fall.

"The fact that there has been selected unusual favorable quarters for holding the Dairy Show this year lends itself exceptionally to the biggest and best exhibition that has ever been staged for the benefit of the man who sells fresh milk in bottles.

"Let us, therefore, each and every one, put our shoulder to the wheel and give this worthy institution our support in every way possible. The least we can do is to see to it that each of us has a representative attendance at Syracuse the week of October 8, bearing in mind that it is your show and without you there would be no need of this annual demonstration of dairy education."

* * *

FROM THE INTERNATIONAL ASSOCIATION OF DAIRY AND MILK INSPECTORS.

The officers and members of the International Association of Dairy and Milk Inspectors are all boosting for the National Dairy Show. We asked Secretary Weld to write us a letter and he replied as follows:

"I have been actively connected with several of the National Dairy Shows and have been a visitor at every show excepting two.

"The changes and developments in the dairy industry during the lifetime of the National Dairy Show are indeed wonderful, and these changes and developments have been directly and accurately reflected in the show itself. It has become a great national exposition of the dairy industry, and it is bound to grow and increase in usefulness. The dairy industry to a permanent agriculture is now better understood, and the direct relation of the dairy industry to human welfare is now better appreciated because of the National Dairy Show."

IVAN C. WELD,
Washington, D. C.
Secretary - Treasurer, International
Association of Dairy and Milk
Inspectors.

New York City

We asked Mr. W. W. Marple of Chicago, to give his opinion of the National Dairy Show, not because he is an official or a member of the board of directors, but because—well, because he is always found among the leaders in a movement of this kind and has earned the title of "Official Toastmaster" at banquets held in connection with the show during all these years. He numbers his friends in the dairy business by thousands. Here is what he wrote us:

"I have seen the National Dairy Show grow from a small beginning at the Coliseum, where it was held under the direction of E. Sudendorf, until it has become what its name implies, a national proposition of very great importance.

W. W. MARPLE,
Chicago, Ill.

"Official Toastmaster," if there is such a position for National Dairy Show Banquets. Director Industrial Relations, Beatrice Creamery Co., and Secretary Illinois Creamerymen's Association.

phitheater at the stock yards, and with increased space and facilities it continued to grow.

"There were some disadvantages in having it at the stockyards, more particularly the fact that it was hard to get to and was difficult to get the attendance from the city, that was very much desired, so it was decided to hold the show at different places.

"I believe the show should have a permanent home. The industry certainly justifies the erection of a monument in especially the way of a building, arranged and equipped for the purpose intended, looking to convenience, comfort and economy. I believe that the commercial feature of the show should be eliminated as far as possible and the one object should be to stimulate the industry by making it more profitable to the producer and rendering better service to the consumer."

FROM DIRECTOR CHAS. L. HILL.

When folks who have been intimately acquainted with National Dairy Show affairs and Chas. L. Hill during the past 17 years think of him they associate him with Guernsey cattle. He is a Guernsey man through and through, and has always boosted for the show just as hard as he boosts his favorite breed. Mr. Hill has been a director for many years. Here is his message:

CHAS. L. HILL,
Rosendale, Wis.

Director National Dairy Association. He has made many trips to the Channel Islands, making many importations of Guernsey cattle.

"It has been my privilege to spend the better part of a week at every National Dairy Show. The growth since the first one, held in Chicago in 1906, is marvelous, but only reflects the growth of the industry in the same time.

"In the machinery exhibit nearly every machine shown now has been invented since the first show.

"My personal interest has been in the cattle exhibit at the show, and the work done by the show in the improvement in the type dairy cattle has been little short of marvelous.

"The animals that won grand champion at the first two or three shows in all the breeds, with one possible exception, would now be unplaced if shown.

"In the cattle industry the National is now indeed recognized as the 'court of last resort,' and everyone covets a ribbon won at that show.

"I think the interchange of ideas among manufacturers of and dealers in machinery at the show has been a great incentive to improvement in this line.

"The one regrettable thing in connection with the show is that we have not secured the interest of the ordinary dairyman to the extent that he considers his show—one that he can feel he cannot stay away from. This is the next step and we are gradually gaining in this respect. I expect that this year's show at Syracuse, N. Y., will show a larger attendance of farmers than any previous show except the one at Springfield and more real dairymen than ever at that show.

"Everyone who is interested in the dairy business and the show wish to testify to the far sightedness and loyalty of the machinery exhibitors who have practically furnished the financial support for this show.

"With the World's Dairy Congress to be held in connection with the show this year, not one of your readers who can possibly go can afford to be absent when the roll is called at Syracuse.

"All who can should attend the opening sessions of the Congress at Washington, and follow on to Philadelphia and Syracuse. All aboard!"

FROM THE MAN WHO WAS SUPERINTENDENT OF DAIRY PRODUCTS FOR SEVERAL YEARS.

During the years when the show was struggling hardest Mr. Chas. Gilkerson, Marengo, Illinois, was in charge of the butter and cheese exhibit. Mr. Gilke-

MENTION "THE REVIEW"—IT IDENTIFIES YOU.

son was a successful Illinois dairyman and active in the various state dairy associations. He is now postmaster in his home town and gets the first chance to read the postal cards. A letter from him is as follows:

"I consider my work as a dairyman and all my future career started when Professor W. J. Frazier, A. J. Glover and Carl E. Lee started me in the real way in dairying by connecting me up with the University of Illinois and selecting my dairy by efficiency methods and not by guess.

CHAS. GILKERSON,
Marengo, Illinois.
Superintendent of Dairy Products,
National Dairy Show 1912-1918.

"In 1911 when A. O. Auten was manager of the National Dairy Show, I was selected as Superintendent of Dairy Products. We had a fair amount of exhibits in all classes and from a diversity of states, but we were new at the business as well as our exhibitors, especially our dairy butter exhibitors. So

much interest was shown that year that the next year we went at the business of preparing exhibits with new zeal and energy.

"The interest in the milk exhibits gradually grew until they taxed the time of the judges.

"The cheese exhibits fluctuated considerably but in later years the quality was much better. I always felt that the cheese exhibits never were in exact proportion to the importance to the family diet, as cheese should enter into our food program more than it does.

"The creamery butter exhibitors have been trained for years to pack and exhibit butter, but it would surprise most folks to see the condition of the butter received from the manufacturers of dairy products as well as the lack of methods used in packing the product. It was gradually improved, however, due to suggestions and personal letters by the superintendent of dairy products.

"Up to the time of taking charge of this department, there had never been any record of exhibits, ex-

hibitors or premiums awarded. Under my supervision a form of tabulation was inaugurated which gave complete record of each article and all necessary details connected therewith and this form is still being used. I understand.

"One difficulty experienced was that of keeping refrigerator for butter, milk and cheese at the proper temperature when the exhibits all had to be kept in the same refrigerator and each entitled to a different temperature.

"My association with the dairy interests in various branches—as a dairyman, as a director of the Illinois State Dairymen's Association, as superintendent of dairy products of the Illinois State Fair and at the National Dairy Show has been of a very pleasant nature. I consider the dairymen and those of allied interests a superior class of people, having more of the "milk of human kindness" in their makeup than the ordinary human being.

"Had I not been appointed postmaster at Marengo, Ill., in 1918, which necessarily terminated my connection with the National Dairy Show, I would have liked to have continued my work along that line. I always considered that I was getting as much, at least, as I was giving.

Along with all who have had anything to do with the dairy show during the years of its development, I am delighted with the progress it is making and hope to see it still further established as the great clearing house for the dairy industry."

* * *

A MESSAGE FROM THE PRESIDENT OF THE NATIONAL DAIRY COUNCIL.

We caught M. D. Munn, president of the National Dairy Council and a director of the National Dairy Association, just as he was packing his grip for that trip to Europe. He was in a hurry, but kindly consented to dictate the following, and, as usual, its good:

"As you know, I have been on this board of directors and executive committee for some little time. When I was first elected to the board I found a stock corporation under the title of the "National Dairy Show Association." The fact was that it was a capital stock corporation and, as its name implied, was a money-making organization. I felt that this in a way hampered the opportunities the association had for constructive display work, and strongly advocated changing it from a stock corporation to a purely membership organization without profit. This was finally brought about, changing the character of the organization from that of a capital stock organization to one of a purely membership organization.

M. D. MUNN,
Director National Dairy Association
and President of the National Dairy
Council. The exhibit of the Dairy
Council has been a big feature of
recent shows.

When You Want a "SANITARY" Milk Pump

you will find Sanitation to the highest degree coupled with mechanical efficiency and simplicity in

The Perfection Rotary Sanitary Pump

Made of acid-proof bronze—all highly polished to eliminate rough spots and sand holes that collect milk and cause contamination. Shaft is of rust-proof monel metal. Nickel plated exterior. All easily cleaned and assembled.

Perfection Rotary "Industrial" Pumps are made for all purposes. Will pump anything from gasoline to molasses. Furnished with direct drive connection to motor if wanted.

*Write for circular
giving complete mechanical details.*

A Perfection Sanitary Pump with variable speed pulley.

DUNN'S CELEBRATED EDIBLE GELATINE

COMPLIES WITH ALL STATE AND FEDERAL PURE FOOD LAWS

WE have purveyed Gelatine to the Ice Cream Industry faithfully ever since we were established in 1879 and for over 20 years were the **ONLY** firm specializing in Ice Cream Gelatines—prior to 1900.

All our goods specially produced and blended are guaranteed for Purity, Uniformity and Value.

THOMAS W. DUNN COMPANY, 546 Greenwich Street.
NEW YORK, N. Y.

Canadian Office and Warehouse: 55 Cote Street, Montreal

"It has always been my idea and vision of the National Dairy Show that it should be a place where once a year there would be gathered a display of the various branches of the industry in such a way and of such a character that not only those engaged in the industry would have the opportunity of seeing the progress and development of the industry itself, but where the public generally would learn some of the details, volume and importance of the industry from the ocular display. I have always felt that this would result in great good, not only to the dairy industry itself, but to agriculture generally."

* * *

"PROSPERITY FOLLOWS THE DAIRY COW."

The big machinery interests have always backed the show with money and effort. Mr. E. W. Chandler, president of the Creamery Package Mfg. Co., and a director responded to our request as follows:

"In my opinion, the National Dairy Exposition graphically proves the truth of our slogan 'Prosperity Follows the Dairy Cow.' Only a prosperous industry could promote and support a show of such magnitude and such variety as ours. Everyone in the industry must thrill with pride when he observes the hundreds of beautiful dairy cattle, the great United States Department of Agriculture exhibit, the splendid promotional work of the National Dairy Council and the two miles of marvelous machines which are almost human in their accomplishments."

E. W. CHANDLER, Chicago, Ill.

A Director of the National Dairy Association and President of the Creamery Package Manufacturing Company.

it exists today but it is a rainbow of promise for the future. We all know that the dairy industry is only in its infancy but the annual exposition helps us to realize what a really glorious future we have ahead of us.

"On all sides at the show we see evidence that while all of us are in business to make money, the real lure of it lies in the fact that while we are making a living, we at the same time are doing an in-estimable service to mankind. For the more care we take in producing pure and delicious dairy products the more we will induce people to increase their use. It is indisputable that increased use of dairy products means better health and longevity.

"A visit to the National Dairy Exposition not only gives us a birdseye view of the greatness of the dairy industry and teaches us a world of new things about the industry, but it inspires all visitors to square their shoulders, take another hitch in their belts and determine that from then on their job is going to get the best that is in them."

DAIRY CONDITIONS IN COSTA RICA.

Costa Rica is one of the countries of the far South where dairying is of growing importance, according to letter just received from that country from an official interested in the plans for the World's Dairy Congress. The congress will hold its opening sessions at Washington, D. C., on October 2 and 3, adjourn to Philadelphia, Pa., for October 4 and continue at Syracuse, N. Y., from October 5 to 10. This letter, which was addressed to President H. E. Van Norman of the congress association reads in part:

"The dairy industry of Costa Rica is of considerable importance locally and a great deal of attention has been given for many years to the importation of pure bred stock for the improvement of dairy cattle. There are quite a few farms where high grade milk, butter and cheese are produced for local consumption. These are in certain well defined districts.

"During the summer season, the question of pastureage becomes a difficult one, although on a few of the farms silos are used. When feed becomes scarce in the summer, the price of butter rises to approximately 8 cents per pound, milk costs approximately eight cents per bottle of slightly less than a quart and cheese is sold at about seventy cents per pound. Shortly after the rains begin, grass becomes abundant in the pasture and the price of butter drops to about fifty-five cents per pound and that of milk to about six cents per bottle. The price of cheese also decreases.

"Labor is cheap compared with that doing the same class of work in the United States, but is less efficient. Thoroughbred and high grade Holsteins, Jerseys, Guernseys, and Shorthorns are to be found on all the farms producing milk, butter and cheese and the improvement of all the live stock goes on continually. The various departments of health supervise the milk sold in the cities and large towns and exact a fixed minimum cream content. Adulterations of any nature are punished by the milk being thrown away on the spot, fine and at times imprisonment."

CALIFORNIA COUNCIL'S SECRETARY PRAISED.

The rapid progress being made by the California Dairy Council is a splendid example of the opposite condition. Meritorious as the work is, and assured of as much public sympathy as it commands, it is unlikely that its present notable success should have been achieved without a manager of the caliber of Sam H. Greene.

"Quality always pays, and this is just as true of men as of products."—Northwest Daily Produce News

WILL A. SCHWINDELER MADE VICE-PRESIDENT OF CARPENTER ICE CREAM CO.

Appointment of Will A. Schwindeler as vice-president of the Carpenter Ice Cream Co., St. Louis, was announced to The Ice Cream Review last month. Mr. Schwindeler recently disposed of the Schwindeler Ice Cream, Quincy, Ill. He was one of the best known ice cream in the state of Illinois, having operated the Schwindeler Ice Cream Co. at Quincy for nine years. He served a term as president of the Illinois Association of Ice Cream Manufacturers, and also is a director of the national association. He is a man of large and varied experience in the ice cream industry.

Mr. Schwindeler has acquired large holdings in the Carpenter Ice Cream Co., and the announcement says that he will assume duties of vice-president at an early date.

It is announced that save for this, Mr. Schwindeler's connection, the organization will remain as it is.

History of Dairy Show

(Continued from page 122)

FROM THE HEAD OF THE PABST INTERESTS.

The Pabst interests in the state of Wisconsin are varied, but dairying probably lies closer to Fred Pabst's heart than any of the others. His big beautiful dairy farm and cheese factory near Oconomowoc is more than a show place. It is a practical demonstration of modern dairy practice. A request to Mr. Pabst brought the following reply:

FRED PABST,
Oconomowoc, Wis.

A Director of the National Dairy Association for many years and head of the big Pabst Corporation.

"Enthusiasm in business is fully as important as capital. Without either, success is quite impossible. We are all apt to get into a rut and be content with the daily routine work. It takes something to shake us up and create a better spirit and new energy to put us into the frame of mind necessary to keep up with the times.

"This applies particularly to conditions on the farm. There are still too many farmers who are satisfied to drudge along with methods that our grandfathers used. New methods for nearly all operations have been devised and it behooves every farmer to at least give them a 'once over' and consider whether he can profitably adopt the most important improvements.

"This applies particularly to conditions on the farm. There are still too many farmers who are satisfied to drudge along

"This is an age of specialization, and many a farmer can increase his output by manufacturing an up-to-date article, whether it be high grade milk, superior butter or other dairy products. There is no better place on earth where information, such as the dairyman needs can be obtained, than at the National Dairy Show.

"Your work in behalf of this exposition is praiseworthy and should redound to the benefit of agriculture in general."

CALIFORNIA SPECIAL TO WORLD'S DAIRY MEET ASSURED.

San Francisco, September 22.—Definite announcement was made today that the World's Dairy Congress Special Train will leave Oakland Pier, Oakland, Cal. September 26, bound for Washington, D. C.

This train will carry the Pacific coast delegation to the World's Dairy Congress and the National Dairy Exposition. The World's Dairy Congress will open at Washington, October 2, run for two days there; then will move to Philadelphia, and then move to Syracuse, N. Y., to join with the National Dairy Exposition.

The Southern California delegation will leave Los Angeles on the evening of September 25 and come to San Francisco, where that party will be consolidated with delegates from the Pacific Northwest and from the northern portion of California.

Sam H. Greene, secretary-manager of California Dairy Council and vice-president of the World's Dairy Congress, will be in charge of the Pacific Coast delegation special. He states that if there are any others who contemplate making the trip, it will be necessary for them to get in touch with him immediately.

The party will include not only dairymen, dairy manufacturers, professors from the agricultural colleges and their wives, but also a number of municipal health officers and welfare workers who are interested in the health phases of the World's Dairy Congress deliberations.

KANSAS MANUFACTURERS TO MEET IN JANUARY

The 1923 convention of the Kansas Association of Ice Cream Manufacturers will be held January 22, 23 and 24, 1924, at Wichita, Kansas.

This was decided at a meeting of the executive committee on September 10 at the Throop Hotel, Topeka. President W. H. Chappell, Manhattan, Kans., announces to The Ice Cream Review that plans soon will go forward toward making this one of the most successful conventions in the association's history. It has been decided, he said, to make the coming convention a three days' session instead of two, as heretofore.

Work on the program will begin soon, and it is promised that it will be one of a constructive and instructive nature.

IOWA PLANT EXPANDS

Between fifteen and twenty thousand dollars has been spent for larger quarters and new equipment has been installed by Constantine Bros., Pella, according to recent announcement. The new equipment includes one five-ton York ice machine, one Chey Perfection brine freezer which will average fifty gallons an hour, one, one-hundred gallon Perfection ice cream batch mixer for pasteurizing and cooling, one viscolizer. In addition to this modern machinery, the company has installed a cold storage plant and a hardening room. The Company has been located at Pella for two years, and since installing this new machinery a few weeks ago, they now are serving towns within a radius of fifty miles.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

You can have the smooth freezing quality, speed and economy of Emery Thompson designs in your choice of vertical or horizontal freezers.

Write to Emery Thompson for copy of the new catalog. It will confirm favorable opinions established at the exposition or secured by conversing with fellow members of the industry.

After All, You Want Results on YOUR Floor!

Well, they will all look fine on the Exposition floor. But, after all, what you want is results on *your* floor. It is out on the floors of the best factories that Emery Thompson Brine Ice Cream Freezers *make the finest display!*

But you really don't know an ice cream freezer until you *see* it pouring out the frozen cream. Why is it so many of the profit-making factories operate Emery

Thompson Freezing equipment? If we were new in the field you might be doubtful as to whether these superior results could be sustained but—as one of the oldest designers of ice cream freezing equipment—we enjoy the prestige that comes from continued good results.

You will get good results for many years on *your own* floor with Emery Thompson Brine Freezers.

Emery Thompson Machine & Supply Co.

NEW YORK CITY

Stage All Set for Dairy Classic

(Continued from page 26)

availability of a large volume of unpublished scientific information," says President Van Norman, "Make this the opportune time for Universal exchange of the most recent knowledge at our Dairy Congress."

Many of the most important foreign as well as American scientists will be at the meeting to reveal and discuss the new developments of the dairy industry.

Although the great national dairy classic is confined to the East this year, the Middle West and the Pacific Coast will be visited by foreign delegates. An itinerary is being worked out for two special dairy excursions—one to the Middle Western states and another to the Pacific Coast.

The trips are being arranged to give foreign dairymen the chance to see at close range the magnitude and diversification of the American dairy industry. Officials of the Dairy Congress have been working with local committees in Wisconsin, Minnesota and Iowa in arranging automobile tours to typical dairy farms, city milk plants, creameries and dairy equipment factories.

The Dairy Congress will adjourn to Philadelphia on October 4, and a highly interesting program will be carried out in that city, including a study of the work done there to increase milk consumption, after which the National Dairy Exposition at Cleveland opens.

A pathetic sentiment attaches to the opening of the National Dairy Exposition. Arrangements had been made for the president of the United States personally to open the "show." President Harding had assured dairy officials that he would certainly be on hand for the opening if nothing prevented him. He could not

foresee the detaining hand of death at that time.

The new president, no doubt, has his time too much taken up by conditions arising from President Harding's untimely death to attend the dairy show, but the program will be fittingly opened and will be of great interest to all branches of dairying, we are assured by Manager W. E. Skinner.

Among public officials to speak are Governor Alben E. Smith of New York, Governor W. H. McMaster of South Dakota, Governor A. R. Nestos of North Dakota, Governor Pinchot of Pennsylvania, Governor Silzer of New Jersey, former Governor Frank O. Lowden of Illinois, former Secretary of the Treasury, Carter M. Glass and many others.

Dairy officials in closest touch with the coming pageant at Syracuse are convinced that the show this year will be the greatest event of its kind ever held. After the appointment last month of county committees to handle local matters in different dairying states in connection with the show, preparations rapidly began to take definite shape.

Every product in use in the dairy industry, including the newest and most modern appliances, will be on exhibition. Every great dairy supply house in the country will be represented. The show undoubtedly will be the most complete.

Meetings and conferences of dairy groups of various kinds will be held. It has been agreed by the various organizations to reserve the time between 10 a. m. and 1 p. m. for the World's Dairy Congress, 1 p. m. to 5 p. m. for the Dairy Show, and the business meetings of the several associations to be held in the evenings.

AN EFFECTIVE WINDOW DISPLAY OF ICE CREAM.

There are some classes of merchandise to which the usual rules of merchandise display do not apply—ice cream, for instance, or other perishable foods. The manufacturer who wishes to work out a window display idea for such a product must take his thoughts out of the conventional groove.

A very effective display for ice cream has been developed by H. P. Hood & Sons, ice cream manufacturer of Boston. Since the merchandise itself cannot be shown they designed some huge lithographed dishes of ice cream showing it in its natural colors, and combined them with hand-painted figures for a background. The complete display consists of the great centerpiece showing a giant dish of strawberry ice cream, a number of small cut-outs showing the same, two quaint hand-painted boy and girl figures and some hand-painted signs with appropriate wording. The hand-painted figures added unusual character to the display.

It was very attractive and impressive. A number of sets were kept traveling among the dealers. Nearly every dealer approached used the display. Check-ups of dealers' sales before and after showed increases in sales up to 40 per cent while the display was in.—Cherry Circle.

Progressive ice cream manufacturers are looking forward to the National Ice Cream Show at Cleveland, October 22-27. You owe it to your industry to attend. The annual convention of the National Association of Ice Cream Manufacturers will be held at the same time.

Jamison Doors

Our Catalog No. 10 gives a detailed description of Jamison Products. It will answer every question in your mind. Simply write to "Desk 5" please.

Give Assurance of Efficiency Where Efficiency is Needed Most!

These doors, bearing the "Seal of Satisfaction," strong, tough, durable, made to withstand the hard everyday usage of heavy service—place the responsibility for their efficiency upon their **HARDWARE**. For it is the superiority and difference in **HARDWARE** that makes the **REAL DIFFERENCE** in doors.

The patented features of Jamison Hardware are the "Strong Points" of Jamison Doors.

THE ADJUSTABLE SPRING HINGES are massive. Their springs can be adjusted from time to time, whenever necessary, by a simple screw adjustment that draws the door tight against the seals of contact to make it as leak-proof as when new.

THE SELF-TIGHTENING FASTENERS are heavy, strong, durable—and yet easy to operate. They prevent the door from opening unintentionally. Banged shut, they make the door "stay put." The harder the slam, the tighter it stays. Regardless of how hard the door is slammed shut, there is no rebound or opening through compression.

It is difficult to tell of these important "Strong Points" in limited space. Yet, they give **REAL DOOR EFFICIENCY**, keeping down to a minimum, change in temperature due to leakage through heat transmission. And therein lies your profits.

When considering enlarging your storage space, it will pay you to give strong consideration to the selection of your doors. Learn all you can about them. Visit your neighbors' plants. They are invariably equipped with Jamison Doors.

... A DEPARTMENT Intended to Assist the Manufacturer in Bolstering Up the Weaker Links in the Chain of Distribution

Effective Bill Board Advertising

By W. B. STODDARD

THE automobile has revolutionized more than one industry, and it has brought into prominence a form of advertising to which scant attention has hitherto been paid. This is bill board publicity, which in the past five years, has changed so greatly that its original sponsors would scarcely recognize it.

In former years when pedestrians were numerous, and old Dobbin jogged serenely along, a billboard was simply a printed sheet in color and people stopped to read it, impressed by the glaring colors and the rudely painted pictures. Now, with the autos and electric

Long before the reading could be distinguished, the motorists or electric car riders could see the head and shoulders of Young America, with wide open mouth about to take a heaping spoonful of delicious cream. Before him was a mass of the frozen sweet, in which big red cherry gleamed enticingly. The lettering was

trains wrizzing by, the entire message must be taken in at a glance, and the sign that bore a lot of lettering would be absolutely wasted.

A slogan—a few brief words—the name and address of the firm—that is the limit of a sign's usefulness. But if these few words are well chosen—like a well lighted window with a single item displayed—they leave a far more distinct and definite impression than a multiplicity of high sounding phrases.

The ice cream manufacturers are well to the front when it comes to featuring delectable dishes, and the appetizing qualities of their cream. A drive through Michigan recently disclosed a number of attractive boards lining the boulevards or standing forth as brilliant splotches on the country landscape. There was not a gross or glaring one amongst them, and each and every one had that "come hither" touch which makes for effective publicity.

On the outskirts of Grand Rapids the Hoekstra Ice Cream Co. had a sign showing a city by moonlight. High over the roofs of the houses, mounted on a giant ice cream cone, was a little lad, upon whom the moon looked down in glee. The picture was captioned "Give your taste a joy ride," and in big letters was "Hoekstras Ice Cream—Demand it for its quality."

The picture and the wording could be taken in at a glance—and a definite impression was made.

The small boy and his sister demanded to be taken to the stores where "the ice cream with a cherry" was served, after seeing the mouth-watering sign of the Piper Ice Cream Co., Kalamazoo.

short and to the point, "An Everyday Essential—Piper's Ice Cream."

Youth, sparkling, effervescent youth, was the theme of the bill board of the Detroit Creamery, featuring their Velvet brand of ice cream.

This sign was in the downtown district, on the side of one of the stores, where it was seen by thousands of clerks and stenographers—who were almost unconsciously impressed with the merits of this particular brand of cream. It showed "sweet sixteen" in a poke bonnet, eating a dish of ice cream, while from the opposite side "seventeen" in sporty cap, drinking ice cream soda through a straw, oggled the fair miss. The brilliant lettering announced "Detroit Creamery—Velvet Brand Ice Cream—The Choice of a Million."

OHIO FURNISHES MOST OF THE PRESIDENTS TOO.

Figures from "The Ice Cream Review," a charming periodical crammed with the most interesting little odd and ends of ice cream, shows that Ohio ate 11,074,000 gallons last year. In this table the population is given as 5,759,394. From this one can see at a glance that this is a per capita consumption of 1.92277 gallons.

And can it be possible that there is any connection between the fact that Columbus has the champion girl beauty of America and the champion boy marble player of the country and the fact that Columbus is in the first division of the ice cream league?—Ohio State Journal.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

Sure of BIGGER WINTER GALLONAGE

This is a real Eskimo Pie year. Ice cream manufacturers have stopped experiment, and are banking on the proven demand for Eskimo Pie. That's why one manufacturer sends an order for a million wrappers for a quarter. Another asked for half a million—clear down the line to hundred thousand orders.

There are no ifs or ands about it. The ice cream manufacturers of the country are concentrating on one name, one size and one plan for bigger winter gallonage. The public knows and likes the one and only Eskimo. It is easier to sell than compete against it.

1923-24 Selling Plan Now Ready

It gives a proven plan—full of brass tack facts—no theories. It gives actual cost of production—cost of Eskimo Pie machine, cost of wrapping, cost of operating. It shows actual successful methods used by manufacturers,

large and small, which increased winter gallonage and made profits right from the start.

With this complete plan you can start the season with a rush and mark the winter on the credit side of the ledger. Think it over but don't forget to put it over. Now is the time. ACT!

Fill out, cut out and send coupon to-day.

ESKIMO PIE CORPORATION, Chicago, Illinois.
Gentlemen: Without obligation send me full particulars of your 1923-24 selling plan for bigger ice cream profits.

YOUR CO-OPERATION WITH OUR ADVERTISERS BRINGS DESIRED RESULTS.

TEN SCHEMES FOR PROMOTING SALES.

By A. A. Correy, Vice-pres., Globe Ice Cream Co.

First—We furnish a very elaborate sidewalk sign, made with a steel frame and a baked enamel advertising plate, which reads—"Globe Ice Cream served here exclusively." This has a tendency to draw people walking along the sidewalk into the dealer's store.

Second—We are placing on the top of each and every soda fountain an oil painting showing various California scenes painted in oil, and, incidentally a road is shown in each scene, and on each road is a billboard, true to life, again advertising Globe Ice Cream as a pure food. In addition, we carry newspaper ads., calling attention to the fact that ice cream is a food and not a luxury.

Third—We issue a little monthly reminder to our dealers, calling their attention to the fact of how an ice cream soda or a sundae should be served, and why the soda fountain should be kept clean and sanitary.

Fourth—We also work with our dealers and devise window trims. We occasionally put over a newspaper story, referring to the food value of ice cream as a wonderful winter and summer food.

Fifth—We put out slogans, which are pasted in the dealer's windows. These slogans are changed each month, and read as follows:

"Globe is a word that makes ice cream preferred in the mouths of the masses, because it surpasses."

"Globe ice cream buyers get all their desires."

"Every time Globe is tried, somebody says, 'I am satisfied.'"

Sixth—We continually take classes of school children through our plant, and give them a lecture

while showing them through our justification.

Seventh—Always laying particular stress on the idea that pure ice cream is a pure food.

Eighth—Various cooking classes talk on the food value of ice cream, and we oftentimes furnish samples for them to serve at these cooking classes.

Ninth—We are working electrical effects throughout the inside of our plant at night. These electrical effects make it possible for us to show the entire interior of our plant to the public, as they walk along the sidewalk or drive by in their automobiles. This is proving a riot and is the talk of all Los Angeles.

Tenth—We are equipping our plant on the outside with spectacular electric displays.

The above display, manufactured by Wolf & Lavenson Philadelphia, is used in the windows and over the fountain of stores selling the goods of the Crane Ice Cream Co., Philadelphia. Scores of different kinds of posters and window trims are manufactured by Wolf & Lavenson.

SALES COMMOTION.

Ice Cream—A Definition.

"Ice cream is a product I handle because I have to, some folks do want it, so I suppose I must have it on hand."—A Dealer.

* * *

Manufacturers of ice cream pass by their best chance to increase sales by permitting "A Dealer" to hold such a sentiment.

By some means and by all means prevail upon "A Dealer" to SELL your product.

Substitute for his indifference positive enthusiasm. He is ignorant—make him wise.

* * *

There are ways in which dealers may be encouraged to sell two gallons where but one is sold now. The average dealer hands out your ice cream when it's called for instead of interesting himself in its sale.

* * *

Make two gallons grow where but one grew before.—From Indiana Manufacturers of Dairy Products Bulletin.

✽

FOUNTAINS ON RIGHT SIDE OF STORE ARE BUSIEST.

An experiment by an Eastern merchant would indicate that the right hand side of a store is much more valuable than the left. He put it to the test. The telephone company was induced to put two slot phones in his place.

He put them in the back of the store, one on the left and the other on the right of the aisle. At the end of the month the one on the right had taken in four times the most money. Virtually the same result was noted at the end of the second month, and the merchant was quite impressed that the right side of his store was much more valuable than the left.

But he tried other tests. Goods that had been selling well on the right hand side were transferred to the left. Immediately sales began to fall off. Goods on the left hand side of the store were transferred to the right and immediately their sales began to pick up materially.

National Dairy Show's Appeal to Ice Cream Industry

By H. E. VAN NORMAN*

O the American ice cream industry:

Few if any industries in America have more rapidly developed from that of a small unit with two or three individuals employed, small investments in machinery, housing, and equipment, into an industry which number gigantic business organizations, organizations with hundreds of employees and even millions of capital invested in a single corporate organization—owning scores of establishments from which to secure raw material and with numerous establishments engaged in the manufacture and distribution of its products.

This industry involves a diversity of activities, from production, through various stages of manufacture, including condensing, drying and refrigerated storage of reserve stocks, the great mechanical problems involved in refrigeration, the manufacturing problem of applying a cabinet, delivery wagons and trucks, and nothing of the infinite variety of scientific problems requiring bacteriology, chemistry and physics for solution, and finally the intricate problems of

each which every business of size requires the successful solution of.

The "Spirit of Progress" in American industry is synonymous with "organization" and "association." It is through the much discussed association that American leaders in every branch of business and science come together to discuss the newest developments of particular interests, to tell each other what they are doing, how it ought to be done, and then every one goes home and does as he pleases. But the net result is that in no country in the world, do new ideas find the way of day and pass into active use and service so easily as they do in America, due to the ease with which we receive new ideas, to our willingness to discard them and the promptness with which we put into effect those which seem worthy.

It is that the East may meet West and North and South, that the newest may be quickly available to all, that the National Dairy Show serves its largest purpose.

Salesmen may tell manufacturers of Portland, Maine, Atlanta Georgia; San Diego, California or Portland, Oregon, of wonderful new developments in his particular "line of goods" but it is not until the manufacturers from these respective cities have met and discussed with each other the merits and faults of their respective equipments that each is ready to make the

resident World's Dairy Congress Association.

new and often very large expenditure that is involved in the modern ice cream plant.

The ice cream industry is inescapably interested in all of the problems of supply and demand of milk, butter and cheese because they affect the price of the products required by the ice cream manufacturer. Those forces which increase appreciation of milk products contribute to the market for ice cream.

The National Dairy Show is the annual portrayal of the years progress in everything pertaining to dairy products, manufacture, the equipment essential for milk handling, discoveries, and even more than these, the cultivation of that national acquaintance which means industry wide progress. No man can reach his largest success without the contacts and observations growing out of attendance at this greatest exposition of the activities based on the dairy cow and her product.

In behalf of the management of the National Dairy Show, I earnestly invite every ice cream manufacturing establishment in this country to have at least one, or preferably more, of its own representatives present at the dairy show, to meet, to see, to take home with him that which will be of dollars and cents value in the business which he represents. If in addition to attendance at the dairy show he can find time to participate in the sessions of the World's Dairy Congress which will open in Washington, October 2 and 3, continue at Philadelphia, October 4 and at Syracuse, October 5 to 10, we shall welcome him and he may touch elbows with leaders from many lands.

Made of Olive Drab Waterproof and Mildewproof Duck, which will outlast five ordinary Tub Covers, without this special treatment.

One Customer says, "We have found from past experience that your cover fits better than any other we have purchased in the past."

Trade Notes

The Cherry-Bassett-Winner Company has transferred J. H. Ashmead from New York to Washington, D. C., it was announced last month. J. S. Taylor recently joined the Pittsburgh division of the company. H. L. Rhinehart has assumed duties of manager of the Philadelphia division.

The Lily Sundae is a novelty originated by the Sanicup Sales Co., St. Paul, Minn., which firm makes strong claims of offering a new outlet for ice cream. The Lily sundae, we are told, fills the desire for a combination of ice cream and fruits and can be carried away from the place of purchase to be eaten. The Lily sundae is a ready-made sundae, a complete product of the ice cream plant rather than the dealer's establishment. It is made in what is described as a water-proof, sanitary cup. Into this cup is poured ice cream until two-thirds full. On top of the cream is placed a layer of chopped cherries, preserved strawberries, grated pineapple, or any other fruit or combination of fruits desired. It retails for 10 cents.

The Walker Vehicle Company, manufacturers of Walker electric trucks with general offices and factory in Chicago, have opened a branch office and service station at 314 St. Joseph Street, New Orleans, Louisiana. Thomas H. Shields, formerly a dealer for Walker Vehicle Company, has been appointed manager.

The increasing importance of the Southern part of the United States relative to transportation needs in cities is given as the reason for opening this branch as well as the establishment previously of a branch office at Atlanta. Among recent installations of Walker Electric Trucks in the South is that 25 Walkers recently put in the service of The American Railway Express Company in San Antonio, Texas.

RE-TINNING ICE CREAM & MILK CANS

SANITARY TINNING & MFG. CO.

3753-63 E. 93rd Street

CLEVELAND, O.

The Cincinnati-Extract Works has been working overtime putting out cold process fruits, including orange Pineapple flavors, etc., according to officials of that firm. They say reports indicate business activity for the fall and winter months. The present season, they say, has been one of the most active in the ice cream business they have experienced. Officials say theirs was the first firm to pack cold process fruits for the ice cream trade. They attribute the growth of the ice cream trade to improved methods adopted by manufacturers as well as the adoption of high quality products for the manufacture of ice cream.

"A smashing advertising campaign to tell the American people the story of Heathization" has been launched by the Heathized Products Co., 400 N. Michigan Boulevard, Chicago. Thirty-four leading national publications are being used in this campaign, these publications including such well-known magazines as Munsey, Colliers, McClure's, Harper's Bazar, Vogue, Metropolitan, Vanity Fair, Drug Topics and The Nation's Health. The story of Heathized ice cream is being told in millions of homes through these publications, say officials of the Heathized Products Co.

The opportunity to furnish things new and novel in the way of ice cream bricks and dishes is afforded by W. W. Cassell, Vincennes, Ind., according to descriptive literature, telling of his ice cream brick fancy center molds. These molds, four different kinds of molds are offered—stock, alphabet, numerals and emblem designs. The stock molds include such varied things as crosses, crescents, shamrocks, Easter eggs, Christmas trees, hearts, wedding slippers, wedding or Xmas bells, making it possible to supply ice cream with appropriate characters in all seasons. The emblems include the various designs of the Masonic and Odd Fellows orders.

W. Pace Woods, president of the Icicle Sales Co., reports a very active sale of their five-cent ice cream dainty. Distribution has been effected in virtually every state in the Union with the greatest sales in the Eastern and Western Coast states, and in the South, Mr. Woods says. In many of the largest cities the sales average 1,000 dozen packages a day.

Icicle differs from the ordinary ice cream dainty, the president declares, adding that it is made in the form of a small cylinder, the bottom being movable and pushed upward as the ice cream is eaten from the top.

The ice cream manufacturer buys the cartons only and fills them with his regular run of ice cream. The name of his company or the brand name of his ice cream is displayed prominently on the package.

Icicle delights the youngsters because of the originality of the package and because of the generous amount of ice cream it contains, according to Mr. Woods, and he says parents like it for its convenience and sanitation.

"The prospects look good for a heavy sale of Icicle well up in the fall months," he declares.

YOUNG AMERICA.

The old man was trundling through Washington Park looking for the Zoo.

"Young feller," he said to the little shaver, "I want to go to the Zoo."

"Well," said the little shaver, and he scratched his head just above the right ear, "you can go just this once but don't you ever ask again."

"It's right over there behind them trees."

You don't believe that story? Neither do I. A traveling man told it.

WASHINGTON

MAINE

News From Far and Near

CALIFORNIA

FLORIDA

San Francisco, Cal.—The Vogue Ice Cream Company has begun delivering ice cream to the wholesale trade of San Francisco. This company operates as a strictly independent company. The company at present is operating a creamery in the San Joaquin Valley. The manufacturing department is under the management of two men who have been graduated from dairy colleges.

Decorah, Ia.—The Sugar Bowl Ice Cream factory in Decorah has done a record business this year, having manufactured more ice cream than any year since the firm has been established. Messrs. Graham & Shema took the business over in 1917. In one month this summer they made more than half as much cream, as they did during the entire first year they were in business. Ninety per cent of the firm's business is shipping, which is done by auto truck express. The firm now ships Sugar Bowl Ice Cream about forty different towns.

Lafayette, La.—An ice cream factory was opened recently on Lincoln Avenue by Larry Martin of Crowley.

Iola, Kan.—Enlargement of the plant of the Iola Creamery Company and its equipment for the manufacture of ice cream for domestic consumption are included in plans for betterment of the company's holdings here. E. Randall, manager of the Iola creamery left September 1, for Lincoln and Denver, where he goes to confer with refrigeration experts regarding machinery and installation. Manager Randall expects to return October 1, at which time actual improvement will begin.

Roxbury, Mass.—Fire started on third story of building 51 Elmwood St., occupied by the Boston Ice Cream Company and owned by H. P. Hood & Sons. The loss was about \$1000.

Mount Vernon, Mo.—Officials of the Carnation Milk Products Co. advise that they are not building an ice cream plant here, as previously reported, but are erecting another dairy at this point.

St. Louis, Mo.—Three armed bandits looted the safe of St. Louis Ice Cream and Soda Company's offices at 517 1/2 Jefferson Avenue of \$2,200 in currency, recently. The bandits compelled Lester Jablanow to open the safe.

Grand Island, Nebr.—The Aurora Butter and Ice Cream Company and the Grand Island Creamery Company have consolidated and will be known as the Nebraska Creamery Company.

Both companies started in business about three years ago. Officers of the company will be located at Grand Island, but plants will be operated at both Aurora and Grand Island. Officers of the new company are: H. B. Stevenson, president; B. H. Robeson, vice-president; R. H. Cunningham, secretary and H. N. Otto, treasurer.

Millville, N. J.—Due to ill health, William R. Pogue is discontinuing his connection with the ice cream industry.

Cincinnati, N. Y.—Fire, which is thought to have started from a hot box at the top of the elevator shaft, completely destroyed the Reid Ice Cream Company plant, together with seven other buildings, recently. The loss to the Reid Company is approximately \$100,000 and the entire loss to the city about \$150,000.

The Reid Ice Cream Company main building was 60x240 feet, two stories high and the milk powder building was 60 feet, three stories. Both are a total loss, with their contents, including expensive machinery and over 2,000 empty milk cans. A new plant is being rushed to completion.

Syracuse, N. Y.—The Cloverland Ice Cream Company has increased its capital stock from \$50,000 to \$100,000 and plans are being laid to enlarge the plant. Architects are preparing plans for the proposed new ice cream manufacturing plant of the White Ice Cream Company of Minot, N. D., which it is estimated will cost approximately \$40,000 when completed.

Dickinson, N. D.—Dickinson Ice Cream & Butter Co., has incorporated with capital stock of \$35,000. Incorporators are N. C. Jensen and H. F. Davis.

Victoria, Tex.—L. A. Fritz is offering his confectionery and ice cream factory for sale exclusive of the buildings. He is retiring from the business.

Berlin, Wis.—A deal was consummated whereby the Berlin Ice Cream Company sold their equipment and goodwill to the Ripon Ice Cream and Beverage Company. The Berlin plant will continue to operate as heretofore, except that the ice cream end of the business will be done at Ripon and the latter concern.

**"PETE" MILLER SAYS CONVENTION WILL BE A
 WINNER.**

The coming Southern convention will be a winner, in the opinion of P. N. Miller, Jr., secretary of the Dixie Flyers, who visited the plant of The Ice Cream Review last month.

Mr. Miller said the stage is rapidly being set for one of the liveliest conventions ever held in the South.

"They mean business," he said, "for I've looked over the territory considerably of late, and I find all the ice cream manufacturers pretty well worked up over the coming convention. Southern association officials are promising a splendid, constructive program.

"One thing about the convention is not so many people really understand Little Rock. A few are under the impression that it is not the sort of town to enjoy oneself in. There never was a greater mistake. Little Rock is a live, progressive city, and the manufacturers of Arkansas certainly are planning in earnest to show folks a good time. The Dixie Flyers will kick in with their entertainment program as usual."

Folks who know what the Dixie Flyers generally do at Southern conventions can appreciate what it means for them to "kick in." The Flyers don't go halfway in a job of that kind.

Mr. Miller was in Chicago to visit his charming daughter, young Mrs. J. G. Evers when he found time to drive over here for a visit.

CAROLINA SPECIAL TO CONVENTION

Plans for North Carolina ice cream manufacturers to attend the National Exposition at Cleveland this month in a body are being shaped up, it is announced by A. E. Dixon, secretary of the Carolina association.

The Norfolk and Western, the short line between North Carolina points and Cleveland, will operate a special car from Winston-Salem to Cleveland for the accommodation of members of the association. The car will leave Winston-Salem at 12 noon, arrive at Columbus the following morning at 6:45, and reach Cleveland at 11:15 A.M. The secretary has asked all manufacturers desiring to go, to communicate with him at Fayetteville, N. C., in order that the necessary equipment may be provided in advance.

"The National Association of Ice Cream Manufacturers and The Association of Ice Cream Supply Men are making great preparations for this event," says the secretary in a bulletin to members. "It will be a meeting of instruction combined with pleasure. You will learn more in four days than sitting in your office in five years."

PRAISES WHEAT'S ICE CREAM COMPANY.

In a letter to E. C. Sutton of the Wheat's Ice Cream Company, Buffalo, Dr. A. P. Sy, chemist, paid a glowing tribute to the conducting of the plant along sanitary lines. The inspection was made without warning. "I have never seen a better plant," the official wrote.

The Texas Barrel Company

is still manufacturing the best Ice Cream Tub on the market. Our increased sales assure us of that fact.

We were the pioneer makers of the TALL TUB and all other makes are imitations. While we are improving this TUB all the time, our imitators are content to stand still and hang on.

Before ordering Ice Cream Cabinets see the new-style Cabinet we are manufacturing. Will keep cream in frozen state for 48 hours with one icing. It has many advantages over the old box Cabinets. Equipped with casters and handles

and easily moved from one position to another. Does away with leakage and water wastage.

*We handle a full line of ice cream cans in all sizes
Can make immediate delivery.*

Simplicity in Ice Cream Mix

By JOHN O. CLAITOR. *

WHOLE sweet milk and sweet cream are without question the best materials for making good ice cream. We know that ice cream, to be good, must have the solids not fat and fat solids in proper balance. We know that to have a well balanced ice cream it must contain about 10 per cent butterfat, one per cent of one per cent gelatine, 11 per cent serum solids, 10 per cent sugar, making a total solids content of about 35 per cent. We know that a mixture of milk, cream, sugar and gelatine does not contain quite enough serum solids nor quite enough total solids to make a well balanced ice cream.

A little study shows that when we make the mix of milk and cream that the addition of just five per cent of the total weight of the mix in the form of dry milk makes it complete. Condensed can be used instead, but dry milk has so many distinct advantages over condensed that we won't consider it in this article. Therefore our mix comes down to the simple rule of one-half per cent gelatine, 14 per cent sugar, five per cent dry milk, balance milk and cream. Further study shows that this milk and cream must be standardized to 12½ per cent butterfat to show 10 per cent in the total mix. We figure milk 8.5 per cent serum solids, 20 per cent cream 8 per cent serum solids, 30 per cent cream 7 per cent serum solids, 40 per cent cream 6 per cent serum solids. Assuming that we are to make a 900 pound mix, we will put it this way:

Ingredients	B. F.	S. N. F.
50 lbs. gelatine 100%	4.50	
100 lbs. sugar 95% solids	119.70	
100 lbs. dry milk 95% solids	42.75	
50 lbs. milk and cream	90.00	57.96
12.5 per cent butterfat		
Total	90.00	224.91
Per cent	10	25

Any size mix can be figured this way. The serum solids are set in too, the solids not fat column for convenience. All of the mixes shown in this article will be around 11 per cent serum solids, which is within the limit of safety. There is no danger of sandiness in all balanced ice cream containing not over 11 to 12 per cent serum solids, provided condensed is not used. The butterfat column and solids not fat column together make the total solids.

If we haven't sweet cream, but have plenty of whole milk, we will have to use some sweet butter.

Ingredients	B. F.	S. N. F.
50 lbs. gelatine	4.50	
100 lbs. sugar	119.70	
100 lbs. dry milk	42.75	
50 lbs. 84% butter	90.00	55.03
100 lbs. 4% milk		
Total	90.00	222.03
Per cent	10	24.6

Maybe we can secure plenty of sweet cream but can't get the milk. We will have to use water and a higher percentage of dry milk. We find that 9.3 per cent of dry milk is needed in this mix instead of 5 per cent.

Ingredients	B. F.	S. N. F.
50 lbs. gelatine	4.50	
100 lbs. sugar	119.70	
100 lbs. dry milk	80.00	
100 lbs. 30% cream	90.00	21.00
50 lbs. water		
Total	90.00	225.20
Per cent	10	25

With the Purity Ice and Creamery Co., Selma, Alabama. Then for The Ice Cream Review.

If we have neither milk nor cream, our last resort is sweet butter, dry milk and water. This is very simple to figure.

Ingredients	B. F.	S. N. F.
4.50 lbs. gelatine		4.50
126.00 lbs. sugar		119.70
106.00 lbs. dry milk		101.00
107.00 lbs. 84% butter	90.00	
556.50 lbs. water		
Total	90.00	225.20
Per cent	10	25

In this mix made of dry milk, butter and water we find that we need 11.3 per cent dry milk, 11.9 per cent butter, balance water. Any desired percentage butterfat can be substituted for 10 per cent and the mix figured out by the same method. An increase of butterfat would call for a corresponding decrease of serum solids to hold the total solids at 35 per cent, and vice versa. A mix like this properly handled will make a fine quality of ice cream and allow an overrun of 90 to 100 per cent.

Acidity of mix seems to be a problem with some manufacturers. There is no problem to it. Just be sure your cream and milk is sweet enough to taste good. Do that and hold the mix at a temperature around 35 degrees and there will be no acidity to worry about.

There is no problem to gelatine either. Buy your gelatine from a reliable manufacturer. Buy a good grade. Keep it dry and well covered. Dry milk should be of the best quality, kept covered airtight, in a dry place. A good test of quality is pleasant taste and freedom from dark settleings when dissolved in water.

The moderate use of ripeners or improvers seems to be beneficial.

EGGSACTLY!

Roy Jennings, chief scout for the Creamery Package campaigners in the South, sends The Ice Cream Review clipping of an ad from The Charleston, S. C., Evening Post, in which the chairman of the city Democratic Executive Committee offers a reward of \$50 "for information sufficient to cause the arrest of the party who threw an egg on the speaker's platform at the joint meeting held on the Citadel green."

"It might be well to devise politicians to watch their step if they ever go to Charleston to do their stuff," says Brother Jennings.

DIXIE MAIL BAG

TALKING WINTER CONSUMPTION IN THE SOUTH.

All the ice cream manufacturers in the South reported very good season as have but recently returned from a trip through southwestern Georgia and Florida and you may not believe it, but they are now figuring on what novelty they will introduce to the trade, this winter so as to keep the consuming public eating ice cream in winter as well as in summer. It seems this constant plugging The Ice Cream Review as well as the ice cream supply men have been doing is bringing results, as you will remember, not so long ago our friends thought when the chilly weather started, it was time to close up the plant and go fishing, but not any more, as they realize ice cream is a food not a luxury any more and is as enjoyable in the fall as well as in the hot months.

SAM LANDAU.

ferent state conventions have brought many of them together in more friendly spirit toward their competitors with a resolve to work together and not against each other by cutting prices, giving more service than one can afford, etc.

The South will be well represented at the Cleveland convention from reports I am getting along the road, they realizing also that it will be some show this year.

In this state of West Virginia, all the managers of the different branches of the Imperial Ice Cream Co., expect to be there same as usual. Needless to say, business is always good. Regards to all the boys.

SAM A. LANDAU.

A NEW FISH STORY.

Understand from a friend who went fishing the other day—that he caught a fish which was cooked and ready to be eaten before it came out of the water. How did it happen?

He tied a bottle of booze on his line as bait—fish sipped booze from the bottle—became drunk—“stewed Fish.”

F. E. ROBINSON.

If you want a manager, superintendent, expert, chemist, bacteriologist, operator, pasteurizer man, or help of any kind, “The Ice Cream Review” can help you find the best available man. If you want a position, “The Ice Cream Review” can help you as it has helped hundreds of others to secure a good position.

“MISS FLORENCE” SENDS GREETINGS.

“Little Miss Florence,” otherwise Mrs. J. G. Evers was a visitor at our plant last month, and between times while looking over the presses and machines that produce The Ice Cream Review every month, she told our editorial staff about how well she was getting along in the North but how greatly she looked forward to seeing her friends at the Southern convention this year.

Mrs. Evers, whose marriage to the well-known Dixie Flyer representative of the Arthur T. Barless concern was a romance of last spring, has been making her home in Chicago since this happy event.

She was accompanied on her visit to The Ice Cream Review by her father, the well-known P. N. Miller, Jr., secretary of the Dixie Flyers.

Mrs. Evers sends cordial greetings to members of the ladies’ auxiliary.

MRS. FLORENCE MILLER EVERS

BILL MALONE.

An aged negro, employed as a handy man in a suburban home, being unable to read or write, asked his mistress to correspond for him with a Virginia relative every month. In each letter he instructed her to enclose \$5 of his wages for “Bill Malone.”

His mistress’ curiosity finally got the better of her and she asked:

“Uncle Jeremiah, who is this ‘Bill Malone’ you keep sending \$5 to every month? Is he a colored man?”

“No, Miss Lucy,” responded Uncle Jeremiah; “he no cullud man.”

“Then he’s a white man?” said the lady.

“No, ma’am,” said the utility man, “he ain’t no white man.”

“It seems peculiar——” began Miss Lucy.

“No, ’scuse me,” broke in Uncle Jerry, “dat’s a right. He ain’t no white man and he ain’t no cullud man. He ain’t no man a’ tall. He’s just bill ’m-loa association.”

“I understand,” said Mrs. Kawler, “that one can learn different languages from the phonograph.”

“Well, I don’t know,” responded Mrs. Wagg, “but I do know that since our neighbors got theirs, Mr. Wagg has used language I never heard him use before.”

“So you asked Geraldine to marry you?”

“Yes, but I didn’t have any luck. She asked me I had any prospects.”

“Why didn’t you tell her about your rich uncle?”

“I did, hang it all! Geraldine’s my aunt now.”

“I had my nose broken in eight places,” he said. “You shouldn’t go into those places,” reproved his friend.

Mistakes are assets—if we don’t make the same mistakes twice.

A SERMON ON SALESMANSHIP.

It is said that an open confession is good for the soul, so we will begin by saying that, although as a boy we were compelled to attend church and Sunday school regularly, we have to confess that we have backslid in these latter days.

That may be the reason why we never got up enough enthusiasm to attend the Reverend Billy Sunday's meetings, although several opportunities presented themselves.

However, this last spring while in Columbia, S. C. we did attend one of his services, the tabernacle being near our hotel.

We can see him now in our mind's eye in his characteristic attitude of throwing the ball, but the one ball he got over our plate was about travelling men. Permit me to quote his words as reported in the next morning's paper:

"In the business world you've got to make a market for the goods as well as to make the goods. A man may be an automaton and make the goods, but it takes a higher grade of intelligence to make the market for the goods than to make the goods. The highest grade of intelligence you can find today in any one class is the travelling man for he has to be a fellow with a good bearing on him to sell the goods."

We imagine that a lot of the travelling men after reading that will feel like a friend of ours, who, after we quoted what "Billy" said on the subject of travelling men, said "Send me a copy of that, I want to send it to our sales manager." Much has been said and written about the travelling man and his steady rise from the "peddler" or "drummer" class, and even poets like El Wheeler Wilcox and James Whitcomb Riley have sung his praises in immortal words; we like that poem of Riley's that starts out,

"Could I but drink the nectar the gods only can,

I'd fill up the glass to the brim,

And drink the success of the travelling man,

And the house represented by him."

And after the discomforts of the stuffy cars on the sho jumps and the home grown meals of the American plan hotel and the enforced absence from home and loved ones we feel that the travelling man has a welcome coming somewhere some time, or as Riley puts it,

"And when he has paid the last fare that he can,

Mine host of the inn at the end of the road,

Will welcome the travelling man."

It is good for the travelling man if he is endowed with a sense of humor, so that he can see the laughable side of things, even if they make one feel sore at the time, as for instance when having to cool his heels waiting for an interview with the purchasing agent or the mogul then does the signing on the dotted line; oftentimes when he can be seen through the glass partition, with his heels on the desk, reading the paper, manieuring his nails or kidding the steno.

It's good to know that such are few and far between but enough so, that when one does strike them it's to the least irritating; it's refreshing to meet the real fellows who are so "big" that they do not have to impress others with their sense of importance and so while waiting in the cozy little ante-room of a company I was calling on, my attention was attracted to what looked like some poetry neatly framed on the wall, and rising to inspect it closer, I read with rising interest and growing appreciation of the concern. I was so struck with it that I asked for a copy and here it is:

TO OUR CALLERS

Most of the officers and department heads of this Company have been "Knights of the Grip" and realize how mu

Ice Cream Enjoys Distinctive Advertising at Wisconsin State Fair

PEOPLE who visited Dairy Hall at the recent Wisconsin State Fair were agreeably surprised to find ice cream occupying a very prominent position in the general scheme of dairy products advertising. The entire corner section of the big hall was given to the ice cream business, the big booth being managed for by the Wisconsin Association of Ice Cream Manufacturers, of which Mr. S. J. Dufner, of the Uecker Ice Cream Co., Eau Claire, is president, and Mr. Karl Mory, of the Mory Ice Cream Co., Appleton, is secretary. The accompanying cut gives some idea of the exhibit but it cannot, of course, convey the response by thousands of visitors, all of whom seemed to enjoy the display and to eagerly accept the literature which freely dispensed. Harry H. Heming, of Milwaukee, prepared the exhibit and was author of the booklet which reads as follows:

Ice Cream Feeds Body and Mind.

By Harry H. Heming.

One day teacher asked the boys and girls in her class how many of them liked ice cream. Every hand went up and there were smiles on many faces. "It is so good," said one little boy, "it is so good." "What a funny question," said one little boy, but another, who had overheard what he said, came back and said: "Why is it funny?" she asked. "Because," replied the boy, "most everybody does." "But, why," again asked teacher. "Oh, just because, I guess." "Now, you are guessing, Tommy," said teacher, "that, you know, is hardly fair. Can't you think of any other reason why so many of us eat and like ice cream?" While Tommy hesitated, one of the younger girls laid her hand on his and said: "I know, teacher, it's because it looks good and tastes good." "Well," said teacher, "that's better, we surely are going along, for now we have a motive for eating ice cream—it looks good and tastes good. But even that is not enough because there are many things that look good and taste good, that are really bad for us to eat. But, let us go a little farther. Can any of you tell me, aside from the fact that it is nice to look at and pleasant to the taste, that ice cream is good for us to eat?" Everybody looked at everybody else but none attempted to answer until one of the older boys said, "I don't believe any of us can answer that question as you can us to. We have always thought of ice cream like any other 'goodies' that are given to us as a treat on Christmas and the Fourth and other special occasions." "Then," said teacher, "we must learn something about the practical use of ice cream because, first of all, it is not just for the sake of eating and drinking, but to keep our bodies in perfect repair and keep our minds fresh and keen, so that we may see and learn about the things that are part of our daily life and that make of us good and useful citizens. You all remember our recent talks about milk and its wonderful value as a food. You have been told that it contains a material that helps make strong muscles and that the protein in milk builds up the blood and the parts of your body. You have learned that neither

young people nor older ones can grow or retain good health unless their foods contain this body-building substance. You also have been told that milk contains mineral matter that makes the bones stronger and keeps the teeth and nails in good repair, and that the fat in milk is the fuel which produces bodily warmth and energy. And there are those other substances called vitamins, without which the body of a child can never develop and grow as nature intended it should.

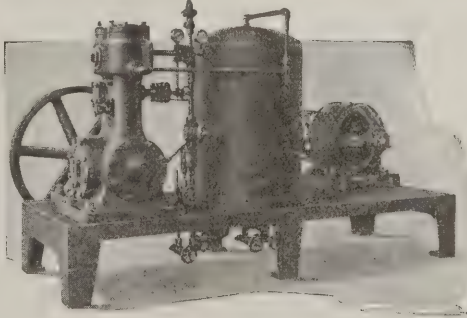

"Milk, therefore, is necessary to the health and growth of our bodies, and other foods are made better and more digestible when milk is used in their preparation.

Ice Cream Is Food.

"Every time that you eat a dish of good, wholesome ice cream, you are adding a rich supply to the materials with which the body is fed and repaired.

"For, ice cream is made almost wholly of rich, pure cream and milk, and therefore contains the very things that help us to grow and to build up our bodies so that they are strong and active and capable of resisting disease. Ice cream also is excellent as a food because it can be used in place of the many greasy, heavy meats and other things that are so difficult for us to digest; and for this same reason, doctors frequently prescribe it as a food for invalids and convalescents.

"Once upon a time, as you have said, Mother on special occasions gave you a nice dish of ice cream as a treat, but now she knows its true food value and serves

it more frequently because it is good for the mental and bodily health and strength of her little ones, and grows up, too."

Ice cream is not alone a luxury, because every quart of it that you feed to your family is the equivalent food value of a pound and a half of round steak, four pounds of chicken, or a gallon of oysters.

**ICE CREAM ELECTRIC DISPLAY EXCITES MURDER
RUSH PUBLIC INTEREST**

A. A. Comey, vice-president and general manager of the Globe Ice Cream Company of Los Angeles, Cal., has devised another unique idea for advertising purposes.

A large electrical Globe (12 feet in diameter) has been added to the electric display on the exterior of the new Globe ice cream plant. This new electric globe is the idea of Mr. Comey's; it contains 335 Mazda lamps with a flash attachment. This electric sign is elevated on a platform eight feet from the sidewalk, can be seen for two blocks and is immediately seen due to the fact that it is staked extremely low from the ground.

This electric globe not only proves a valuable advertisement for the Globe Ice Cream Company, but it illuminates the entire street in front of the elaborate Globe plant. It has caused very unusual commotion. People from all parts of the city come to the Globe plant at night to witness this electrical display. Never before in the history of manufacturing has any plant ever attempted such elaborate electrical effects as are now used by the Globe Ice Cream Company.

The outside of the building is ablaze with carefully blended lights, while the inside is so illuminated that the entire interior of the plant is on display to the public at night.

Beautiful flower gardens are being planted in front of the building, and, within the next thirty days' time, the management hopes to finish the new \$250,000 addition, and at that time open house for public inspection will be held each and every night for two weeks, from the hours of 7:00 P.M., to 11:00 P.M. The fifteenth of August marked the first year's anniversary of the new Globe Ice Cream Company. The growth of this new concern has been phenomenal, and at the present time this factory, with the new addition, represents an investment of \$700,000, officials say.

Approximately, \$50,000 more is being spent for a strictly modern and up-to-date garage. Work on the new concrete garage was started yesterday.

The Globe Ice Cream Company's plant now occupies a space of approximately one-third of a block. Seventeen large refrigerated trucks are now being operated by the Globe Ice Cream Company, and fourteen more four-ton trucks have been added.

"Globe Made for a Critical Trade" is the slogan of the Company.

Globe Ice Cream Company welcomes any and all Manufacturers in the United States to visit their plant.

It is quite possible that Globe Ice Cream Co. will very shortly erect two or three more plants in other cities, the names being withheld for business reasons.

**NEW ENGLANDERS FORMING CONVENTION
PLANS.**

Officials of the New England Association of Ice Cream Manufacturers were working out plans for the next annual convention as this issue of The Ice Cream Review was about to go to press. A meeting to select the site for this was scheduled for September 19.

NEWS ABOUT SUGAR

Items of Interest for the Ice Cream Manufacturer

Factors Affecting Price Movements

The statistical position of sugar has come in for a great amount of discussion during the past few months. In particular the stocks available to the United States from sources which ordinarily supply this market have been the subject of analysis by numerous trade observers. Practically all of these, so far as we have observed, agree that the balance of shipments to come forward from the continental and insular United States and Cuba will be no more than enough to meet the demands of American consumers for the remainder of the year.

While those who have attempted to forecast the situation differ considerably in minor details, they have been practically in agreement in characterizing the statistical position as exceptionally strong. This is not a recent discovery, as it has been evident from the beginning of the year that the world's available supply during 1923 would be less than in the preceding year by a million tons or more. Despite this favorable condition, however, there has been a fairly continuous decline in prices during the past three months which has been checked, temporarily at least, by the upturn during the current week. It is a natural conclusion, therefore, that either the statistical position was not as strong as had been generally agreed, or else that it has not been the controlling factor in deciding prices to the extent ordinarily assumed.

While there is nothing in sight to indicate the probability that surplus stocks of noteworthy extent will remain on hand at the close of the year, it must be admitted that the slowing up in the movement of sugar into channels of consumption or, to phrase it more accurately perhaps, the length of time required to digest the heavy supplies accumulated in the early months of the year, has made the statistical position relatively less strong than it appeared three or four months ago. This is evidenced in the American market by the fact that the difference in stocks on hand in Cuba as between the two years has been steadily decreasing. In the middle of June stocks at the ports in Cuba were 375,000 tons less than at the corresponding date in 1922, but by mid-August this difference had been reduced to about 43,000 tons.

Another influence which, for a time at least, contributed to the declining tendency of the market was the heavy movement of Java sugars to western markets, and more particularly to Europe. As shown by figures published on another page of this issue, such shipments of the new crop, including cargoes consigned to Mediterranean ports for orders, were eight times as great to the end of June as during the corresponding period of 1922. When this movement began it was interpreted as meaning a material decline in purchases by oriental markets, but statistics to hand indicate that distribution of Javas in the Far East has been in about the normal volume and that the heavier shipments to Europe mean that the crop is being marketed more rapidly than usual. Properly considered, therefore, this is a strengthening rather than a weakening of the statistical position, as it means that a smaller volume of Javas will be available for distribution later in the crop year.

Study of the course of prices in different markets over a number of years seems to indicate, moreover, that from July on the expectation of the trade in regard to the extent of the approaching crop is more influential as a price factor than is the state of existing stocks. If this holds true of the present year, we must assume that operators in the principal markets of the world look forward to increased production and lower prices during the coming year. That coming crops will be somewhat larger than those of the past season is apparently true, since current estimates forecast a gain of 500,000 to 750,000 tons in European production, while the beet sugar output of the United States will increase possibly 175,000 tons and Cuba probably will turn out a crop somewhat larger than that of the 1922-23 season. Various other countries will show increases that are not likely to be completely offset by declines in other less favored sections.

Assuming that the leading sugar markets, aside from temporary or local unsettling influences, have been engaged in discounting a larger world crop, it likewise appears to be the case that since this movement began views as to the probable extent of the gain in production or in the volume of sugar likely to be available during 1923 have undergone some modifications. It is not worthy that while spot and nearby positions have experienced a considerable decline, quotations for the more distant months, such as March and May, 1923, have advanced on the principal options markets. If these markets are reliable trade barometers, it appears to be the fact that observant members of the sugar industry believe that the quantity of sugar likely to be available during the first half of 1924 will be less than was previously expected.

While it is not likely, nor is it from the viewpoint of the sugar producer desirable, that 1924 will duplicate the record of the current year in the matter of prices, it does seem probable, if we may depend on the price indicators referred to above, that in next year's market the lowest quotations are likely to be recorded early in the year, and that there may be a gradual rise in prices as the season advances.

—Facts About Sugar.

GEORGIA MEETING CHANGED TO OCTOBER 4.

As this issue of The Ice Cream Review was going to press, it was announced by Secretary Sam Marshall that the Georgia meeting had been postponed until October 4. Columbus, Ga., will be the scene of the meeting, instead of Mr. Marshall's home town, Albany, as formerly was planned. The delegates will meet at the Columbus plant of the Kinnett Ice Cream Co., as Columbus will be crowded that day owing to the Stribling-McTigue boxing match to be held the same day, and hotel accommodations are uncertain. A number of important matters are to be discussed, including a special car for the Georgians to the National Convention.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

When You Choose a Cabinet Consider Its Tank

As every ice cream manufacturer knows, the tank of an ice cream cabinet determines to a very great extent the life of the cabinet—A tank that will stand up to all abuses and give real service is worth while.

Why the **TIFFANY** Cabinet Tank is the Greatest Improvement in Cabinet Construction in Years

TIFFANY cabinets are lined with a tank twice as heavy as the standard tank lining—The tanks are made of No. 18 gauge hard steel, which is harder to puncture with icing bars than pure iron, which is soft.

All tanks are welded, not soldered, and when the tank is finished it is hot dip galvanized, which puts on a zinc coating four times as heavy as most commercial galvanized sheets.

There are no packing washers or lock nuts to play out on TIFFANY tanks. Instead they have a threaded connection for the drain nipple which is $\frac{1}{2}$ " thick and is welded directly to the tank. A leak here is impossible when the drain nipple is screwed in tight. All tanks are fitted with a 1" brass nipple and have a special drain cock.

Other features in this cabinet will appeal to you.

Every manufacturer should read our booklet on cabinets. Sent upon request.

TIFFANY & COMPANY, Inc.

Manufacturers of Good Ice Cream and Soft Drink Cabinets

CARBONDALE, PA., U. S. A.

A CABINET IS AS GOOD AS ITS TANK

SOUTHERN CONVENTION DATES.

The correct date of the Arkansas meeting is December 3, Hotel Marion, Little Rock, as related on page 91. This is one day before the opening of the Southern convention.

The Oklahoma association meets at Tulsa, November 21, 22 and 23, with Hotel Tulsa convention headquarters. The Texas association meets at Galveston November 26, 27 and 28.

The North Carolina association meets at Winston-Salem after the holidays, selecting January 15 and 16 as its dates. The Mississippi convention has not been decided upon, but it is thought that it will be held a few days after or a few days before the North Carolina convention. The Georgia annual convention also will be held some time in January, as also, probably, the Alabama association.

MINNESOTA AND NORTH DAKOTA MANUFACTURERS MEET.

Ice cream manufacturers of North Dakota and Minnesota held a sectional group meeting at the Fargo, N. D., Commercial Club the evening of September 10th, to discuss topics of interest in their business.

J. J. Farrell of St. Paul, secretary of the Minnesota Ice Cream Manufacturers' Association, was present and addressed the meeting. F. O. Knerr of Fargo led a discussion on manufacturing problems. There were ice cream manufacturers present from St. Paul, Wadena, Crookston and Detroit in Minnesota, and from Grand Forks, New Rockford, Jamestown and Lisbon in North Dakota.

Nels Baden of Wadena, was chairman of the meeting.

Progressive ice cream manufacturers are looking forward to the National Ice Cream Show at Cleveland, October 22-27. You owe it to your industry to attend. The annual convention of the National Association of Ice Cream Manufacturers will be held at the same time.

A SERMON ON SALESMANSHIP

(Continued from page 142)

of a salesman's time is taken up in ante-room waits—often due to forgetfulness on the part of the wheel chair chauffeur. We try to be different in this office and if you don't hear from the party you wish to see—or in case he is engaged from his secretary—within five minutes after your card sent up, please ask the switchboard operator to call "General Manager's Department" and your wishes will be given immediate attention.

THE VICK CHEMICAL COMPANY.

While we didn't get an order, we left with a most pleasant feeling regarding the firm and its management that we have been sounding their praises ever since which, take it from me, Bill, is mighty good advertising for them and doesn't cost them a cent. If there is any moral to this tale dig it out for yourself.

—Mercury.

**THE VALUE OF TRADE MARKS TO THE ICE CREAM MANUFACTURER**

(Continued from page 96)

have been using your mark for some time without investigating your title to it, submit it now through the editor of The Ice Cream Review and avail yourself of the free service offered by this Journal to its readers. This may save you many dollars. In any case it will make you better acquainted with your mark.

In conclusion we should sum up the proposition by saying:

If you have anything to sell, you must have a name for it, so you may acquaint the public with the fact. Choose this name with the utmost care and after exercising every precaution, employ trade mark lawyers who specialize in that particular line to look after the matter for you, and after you have secured your mark and taken every means of protecting it, give it all the publicity you can, guard it as you would your own good name, and it will repay you a hundred-fold, because it is the trade mark that sells the goods.

You can get somebody to sell you anything you want if you use "The Ice Cream Review" Want Department.

HOLLINGER SEES GOOD BUSINESS

The Ice Cream Review:

Left Chicago August 20, stopped at Kansas City, Mo., and called on Mr. Fred Peal, Article Ice Cream Company, and he advised me they had a fair season but not as good as 1922. Also made stops at Great Bend, Kinsley and Dodge City, Kansas. Then La Junta, Pueblo, Denver, Colorado Springs, Salida, and Junction and Provo, Utah.

All ice cream manufacturers I called on had a good season. But prices are low when quality is considered. I make a high grade of ice cream. There are a good many planning on going to Cleveland Show, and it will be one of the largest Supply and Ice Cream Manufacturers Conventions ever held. I am going to Spokane, Seattle, Portland and San Francisco. Business has been good so far.

With kindest regards to all, and hoping to see you at the Dairy Show and at Cleveland, I am

CHRIS. HOLLINGER,

Hudson Mfg. Co., Chicago.

PENNSYLVANIA AND JERSEY MANUFACTURERS PREPARE FOR CONVENTION

Ice cream manufacturers of Pennsylvania and New Jersey are getting in readiness for their annual convention at Altoona, Pa., November 13, 14 and 15. Hotel Alto will be headquarters.

The convention this year is expected to be fully in keeping with past highly interesting and instructive ice cream conventions in Pennsylvania. The Jersey folks have been dropping in to meet with the Pennsylvanians for some time, but this will be the first convention since the amalgamation of the two associations. At the sixteenth annual convention, October 9, 1922, a resolution was adopted by the Pennsylvania association proposing a joint association, and the name accordingly was changed to the Association of Ice Cream Manufacturers of Pennsylvania and New Jersey.

E. E. Rieck of the Rieck-McJunkin Co., Pittsburgh, has succeeded the late Mr. Robert Crane as president of the association. Mr. Crane had been president of the association since its organization in June, 1907.

IOWANS MAKE PRELIMINARY PLANS.

Advance preparations for the coming convention of the Association of Ice Cream Manufacturers of Iowa and its auxiliary, the Poodle Dog Association, were begun September 8, when a meeting of Poodle Dog officials and members was held in the office of Secretary G. Rose, 211 Royal Union Life Bldg., Des Moines, Ia.

The meeting was simply a get-together affair to talk over preliminary plans. The convention will be held in Mason City. Dates will be decided at a meeting of officials of the manufacturers' association and Poodle Dog officers. The Poodle Dogs' entertainment committee will consist of A. G. Rose, E. A. Postlewait and Ben Ogden, Jr. Secretary Rose reports that every effort will be put forth toward making the convention one of the best in the history of the industry in Iowa. At least one very pleasant surprise is promised. J. E. Enright, president of the Poodle Dogs, says his organization will not be found wanting.

One enterprising ice cream parlor proprietor has a sign displayed at a number of filling stations in his vicinity. When a weary, travel-stained autoist stops for service he reads: "Step Around the Corner and Try Our Cold Dishes. See Our Road Map, too." The road map information draws many customers.

PROSPERITY FOLLOWS THE DAIRY COW. Be sure you attend the National Dairy Exposition—Syracuse, N. Y., Oct. 5-13.

NORTHWESTERN Ice Cream Bar Cutting and Dipping Machine

*Makes a Generous Profit
Possible On The 5c Bar*

Keep Your Plant Running Full Blast

Chocolate coated bars at 5c sell like hot cakes summer and winter, and particularly during the cold season when your "RUSH" is over. It will pay any manufacturer who is in business to make money, to investigate the merits of this remarkable piece of machinery.

The NORTHWESTERN makes it possible to produce the 5c bar at a net cost of 20c per dozen including license, wrappers, labor, material, etc. With two persons, 90 dozen bars are easily made, wrapped, and packed per hour.

Not only reduces labor costs to less than a penny a dozen, but eliminates all loss of chocolate and cream. All bars are exact in size, weight and shape—coating the proper thickness—and no wasted ends.

By using a blend which we furnish on request, we guarantee a better coating, obtained at a cost not to exceed 5c a dozen bars.

This machine is used by many prominent manufacturers in the United States, Mexico and Australia. Particulars and a long list of users sent on request. Machine complete, including motor, electrically heated dip and drip tanks, ready to run,

Pre-Exposition Trade Notes

(Continued from page 84)

THE CHERRY COMPANY.

The exhibit of the J. G. Cherry Company of Cedar Rapids, Iowa, at the National Dairy Exposition, Syracuse, October 5 to 13, will be housed in what is known as the Machinery Hall Annex, the first building on the right at the main entrance to the State Fair grounds, where the exposition will be held. Officials say more than 15,000 square feet of space will be required properly to display the complete line of dairy machinery this company will show—more space than was required for the entire dairy exposition a few years ago.

The exhibit will include a showing of the entire list of equipment of their manufacture used in the creamery, milk plant and ice cream factory. Every type of Cherry coil machine will be on display as well as the Cherry standard and Dreadnaught Churns. Several new sizes and types of freezers will be shown.

But the features of the Cherry exhibit will be the "surprises" of which we are permitted to only make mention in advance. That these "surprises" will be the main center of attraction in Machinery Hall Annex is certain, we are told, as many months' preparation have been required to get them ready and thousands of dollars have been invested in assuring that they be "surprises" in fact as well as name. You can be sure of a real treat when you visit the Cherry display.

As for many years past, S. J. Van Kuren, or as so many of us know him, "Van," will have charge of the exhibit and its installation. And, of course, Walter, Toward and Herbert Cherry will be in attendance as well as "Mac" McEwen and "Wally" Hamilton, Walter Maguire of the Chicago office, Frank Brown and Walter Hoeltje of the St. Paul office, "Hal" Teller, "Rush" Damuth and "Cap" Bagby of the Cedar Rapids office.

MANTON-GAULIN MFG. CO.

The Manton-Gaulin Mfg. Company, manufacturers of the Gaulin Homogenizer, have recently brought out a new machine known as the Gaulin Blender for use by dairymen and milk and cream dealers. This machine supercedes the centrifugal type of machine the above mentioned company man-

ufactured and is built along the same sturdy lines as the well known homogenizer. Officials say only one size machine is being manufactured at the present time, same having capacity of 300 gallons per hour and operating with a 3 h.p. motor. This machine takes the place of any machine marketed heretofore for blending or emulsifying milk or milk products, according to the officials. All of the objections to the high speed centrifugal machines have been overcome in this new creation, and it has, moreover, been made, the manufacturers claim, "fool proof." One of these machines will be on exhibition in the Manton-Gaulin booth at the National Dairy Show. The Manton-Gaulin Company will occupy Booths Nos. 35 and 36, building No. 3.

* * *

ELYRIA EXHIBIT.

Booths Number's 168, 169 and 170: — Elyria glass enameled 2,000 gallon completely jacketed milk storage tank completely equipped with recording thermometer, 1 inch motor driven propeller agitator, removable flush-bottom outlet valve, non-foam inlet, etc.

Elyria glass-enameled 500 gallon pasteurizer completely equipped with 15 inch Green agitator, motor driven, recording thermometer, two-piece cover and with non-foam inlet, 2 inch removable flush bottom outlet valve, etc.

Elyria glass-enameled 350 gallon Elyria milk pasteurizer equipped with propeller agitator, tight and loose pulley drive, three-piece cover, angle stem thermometer, and removable flush-bottom outlet.

Elyria glass-enameled 100 gallon junior pasteurizer with cooler and bottle filler. Besides these three major units: pump driven by the motor which drives the agitator and sanitary piping are furnished. This assembly makes a complete unit for small plants and can be purchased complete or in single units.

Representatives: H. S. Calvert, B. L. Hartz, J. E. Simpson, M. J. Goodwin, D. B. Etters, P. J. Cochrane, S. A. Smith and R. W. Smith.

COME TO SEE US.

The Olsen Publishing Company will occupy space 33 at the National Dairy Exposition. Make yourself at home with us there. Friends of The Ice Cream Review, the Butter, Cheese & Egg Journal and The Milk Dealer will find a very cordial reception.

Remember the space — NO. 33.
Come to see us!

C. J. TAGLIABUE MANUFACTURING CO.

C. J. Tagliabue Manufacturing Co., Brooklyn, N. Y. will exhibit some of its representative products, namely:

The improved form Tag recording thermometer, which embodies an improved operating mechanism of "extremely rugged construction," the use of an evenly graduated chart for all ranges, pen adjustment for position, pen pressure adjustment, non-corrodible inverted pen arm, clock starter and improved chart holder.

The Tag dial-indicating thermometer, which incorporates the same improved construction and operates according to the same reliable principles that insure sensitiveness, accuracy and durability in Tag recording thermometers, according to company officials.

The Tag temperature controller which is in world-wide use on pasteurizers because by its exact automatic regulation the desired temperature is always maintained without attention. loss of product or waste of steam, officials say. Perfect pasteurization, it is claimed, is assured by this precise control which, in addition, insures a good cream line promotes the keeping quality of the milk and preserves the natural raw taste.

Tag industrial thermometers furnished with the Tag hespe red reading column, shows a broad red line from the top of the mercury column to the top of the tube. When the mercury rises, it covers more of this red line; when the mercury falls a correspondingly greater length of the red line is exposed. The red line attracts the eye at first glance and it is easy to follow it down and take the reading at its bottom, which is, of course, the top of the mercury column. This exclusive Tag feature brings to the accurate mercury thermometer the easy readability of the red spirit instrument, it is claimed.

Tag chemical thermometers and hydrometers also will be exhibited.

Advertising Setting the Pace*

ADVERTISING—the great pacemaker—has at last awakened the ice cream industry to its far-reaching possibilities. It has taken its place alongside other national industries. The tremendous popularity of Colonial Ice Cream is built on the bedrock of Advertising. We made sure we had an ice cream superior in quality, purity and taste to any other ice cream ever made and then we proceeded to tell Philadelphia about it. Our fame traveled far and wide—throughout the entire adjoining territory along the coast and to New York.

Advertising is increasing the per capita consumption of ice cream, August Belden tells us in *Printer's Ink*. Mr. Belden says, in part:

"Consider the ice cream business for a few minutes. This industry has been growing rapidly for the past ten years, but it has only scratched the surface of its possibilities. In the joy of its growth it has neglected one thing which has built American industry—advertising—and it is advertising which will place this industry in the position it is destined to occupy, a position probably far beyond the dreams of its most optimistic leaders.

"But at last advertising and ice cream are getting together more thoroughly than they have ever done before and in a way which looks good for the future. Some manufacturers, of course, have advertised their product for years, but the industry as a whole is just awakening.

"Reasons why ice cream manufacturers must advertise are cropping out. But before we get into this phase of the subject let us see exactly to what the industry amounts. Popular imagination may believe that the ice cream business has gone ahead about as fast as the automobile business and think that ice cream is making new records, so far as speed of growth is concerned. Its strides have indeed been rapid and it is becoming a major industry, but there are other trades which have preceded it in rate of increase.

"To visualize the important position which the ice cream trade has gained in our economic life, consider these figures of the consumption of raw products:

"More than half a million cows make up the herd which supplies milk and cream to the industry. More than a half million barrels of sugar are needed to sweeten a year's output and nearly three-quarters of a million tons of salt are used to help keep it cool. These are stupendous figures.

"In 1900 the total output of the industry was approximately 30,000,000 gallons. The year 1910 showed over 117,000,000 gallons and 1922 a total of 242,000,000. The biggest year was 1920 with a record of more than 27,000,000 gallons. From 1910 to 1920, the peak year, the increase was 120 per cent. The wholesale value of industry manufactured during this period showed an increase of 233 per cent. From 1910 to 1922 the automobile trade jumped 156 per cent, and the cigarette industry gained over 500 per cent in ten years.

"What would have been the gain in ice cream sales if advertising had been used in the same proportion as in these other trades?

"There have been several causes contributory to the growth of the ice cream business during this period. Improvement in manufacturing processes, a betterment of the product, prohibition, the increase of quick lunch establishments, the increase in population, the entrance of progressive business men into the industry and advertising all have contributed to the increased sale.

"In the old days much of the ice cream sold was made by all sorts of people in all sorts of places—cellars, barns, old sheds and dirty back rooms. There were no laws to govern its manufacture and ice cream that was not what it should have been was sold to all who dared to buy it. Mothers questioned the ice cream their children ate and that question of cleanliness and purity became implanted in the public mind.

"Conditions have changed in recent years. Pure food laws say that ice cream must be pure. Competition has forced manufacturers to keep it pure. A high type of business man has entered the industry who insists upon purity. So today the wholesale manufacture of ice cream is on a higher plane. Many millions of dollars are invested in sanitary plants and there is no excuse for a product which is not up to the highest standard.

"To counteract the old prejudice against the purchase of ice cream at the soda fountain or candy counter, manufacturers are telling the public of the purity of their product through advertising."

Speaking of the remarkable growth of the Colonial Ice Cream Company, Mr. Belden continues:

"The Colonial Ice Cream Company established a large business in its territory. Here, too, advertising was the power which made it possible. The Colonial Company began business in 1920. Three months before production the advertising appeared and the company opened with 1,000 dealers on the books. Large advertising space was used and purity and quality were the keynotes of the campaign.

"In addition to the regular arguments this company had another selling point. It had adopted the Heath method of purifying the air in ice cream. An interesting series of advertisements was used by the company to exploit the process. The advertisements were directed to the 'Medical Fraternity,' to 'Institution Managers,' to 'Hospital Superintendents,' to 'Nurses,' to the 'Superintendent,' Principals and Teachers of our Schools' and to the 'Men Who Operate Soda Fountains.'"

WHY NOT MAKE ICE CREAM "EASY TO BUY."

Three sales managers were eating lunch in the back of a small confectionery store, and after the fashion of sales managers they started to talk shop. At the time the paper were carrying full-page copy of Eline's chocolates, and this campaign was being discussed.

All the men agreed that the copy and selling plan was good, but none of them had sampled the product. They had all intended to buy a package to see if it was as good as the advertising. But none had remembered the advertising long enough to think to ask for a package of Eline's. When the time came to pay the checks all had forgotten about the discussion, but near the cash register was a small display carton with a dozen or so packages of Eline's. They all bought a package of the chocolates, because it was so easy to buy. Right there in front of them, when they had change in their hands, it required no effort or thought to say "Gim'me a package of Eline's," just as if they had been buying it all their lives.—From Sales Management.

You can find the person who will be glad to buy what you wish to sell, by letting your desires be known through an advertisement in *The Ice Cream Review*.

BOOTH No. 39

Ladies' Auxiliary to S. A. I. C. M. and Other Organizations

SECRETARY SEEKS NEW MEMBERS.

Dear Friends:

As an appeal for new members, the letter I sent out has been anything but a huge success. Have you any suggestions?

If we could only make some of these Dixie Flyers and Southern ice cream manufacturers realize that we want their wives as well as them present at Little Rock, Ia., Dec. 4, 5, 6—I feel sure we could persuade a great many of them to join.

Now, I know a great many of the present members must know some of these wives, so won't you please do your utmost in your territory to boost our membership.

Of course, our auxiliary, as it is, is delightful, and I am sure we all anticipate just as good a time at Little Rock as we had at New Orleans, but think of all the wives who are left at home. How nice for them, if we could only convince their husbands that we will relieve them of the responsibility of entertaining the ladies after they arrive in Little Rock—if they will only bring them.

From three hundred and fifty letters sent out, I have only two new members to report—Mrs. Chris Hollinger, Chicago, and Mrs. A. A. Fay, Natchitoches, La. To them we extend a hearty welcome.

I hear so many delightful things about our bride, Mrs. Evers. Having her with us in Little Rock will certainly give an air of festivity to the first meeting.

Really, the months fly by so that I know the fourth of December will be here before we realize it, so just as a reminder, Tuesday, the fourth, is the day of our luncheon, and as the day draws near, I am making another appeal to you all for suggestions for that first grand affair.

For the single aim and ambition of your officers is to make this convention the most pleasing and memorable you have ever attended.

All aboard for Little Rock, and a carload of new members. Do get after every man you know who attends the conventions, and just make him bring the lady of his family, and send their names to me so we can make arrangements in advance for our increased membership.

Hoping you all have enjoyed a pleasant summer vacation, beg to remain, Most sincerely,

MRS. E. B. GEISEL,
Secretary.

You'll make better ice cream if you get "The Ice Cream Review."

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

THE BOOK THAT MAKES EVERY DAIRY AND ICE CREAM PLANT PROFITABLE

Modern competition demands that the building shall conform to its equipment and that the equipment shall be so installed and arranged as to expedite the labor of production.

In any manufacturing line whatever makes for speed and the elimination of unnecessary work increases profits. A big business is not a paying business unless production cost is reduced to a minimum.

Long specializing in the Dairy and Ice Cream Industries has given McCormick Architects and Engineers the experience, knowledge and skill necessary to produce profit making plants.

"Profitable Building" tells you all about it. Write for a copy—no obligation—just a request.

OCTOBER 15, 1923

ALL roads lead to Cleveland. We have the promises of the officers of the two great ice cream national associations that there will be heavy traffic over these roads during the few days preceding the week of October 22, when "the Rose of the Dairy Industry" will stage its annual carnival.

The Association of Ice Cream Supplymen, which will attempt to repeat the colossal success of the 1922 National Ice Cream Exposition, announces indications of an attendance of 4,000. This would break all records for gatherings of ice cream men.

There are signs favorable to the complete realization of exposition officials' fondest hopes. Everything points to a great all-American ice cream trade classic, with every section of this country and parts of Canada represented.

The World's Dairy Congress ends at Syracuse about ten days before the opening of the National Ice Cream Exposition. No doubt some of the foreign dairymen in this country to attend the congress will "look in" at Cleveland for an insight into the American ice cream industry. Some of the European countries are begin-

ning seriously to consider the ice cream industry a promising line of activity.

Interest throughout ice cream manufacturing circles of the United States is running high, so it seems. The Ice Cream Review's observations. News of last year's success has spread like proverbial wild fire. Reports have fired the enthusiasm of men who usually content themselves with a trip to a state convention every year, with never a thought of the national association of the industry. Many men who seldom attend a convention of any kind undoubtedly will attend.

There is every reason to believe that officials are justified in expecting an attendance of 4,000. It seems that it will be the occasion of the mightiest outpouring of American ice cream men in the history of the industry.

In the language of the street, gentlemen of the trade in Cleveland is a good bet. Pick out one of the roads leading to Cleveland, the shortest one.

WHAT is the National Ice Cream Exposition? This is not clear in the minds of all manufacturers. Some think it is going to be a great revelation, a chance to get away from the old home-town and look over the traces a bit where brother pillars of the church will not be to see. Others think it will be an occasion for supplymen to buttonhole them and try to sell the things they can't afford.

The 1923 National Ice Cream Exposition will be the second in the history of the industry. It is to be staged by The Association of Ice Cream Supplymen, an organization governed by the strictest code of trade practice. It will be staged with the co-operation of the National Association of Ice Cream Manufacturers, an organization that has done much to advance the ice cream industry to high rank in national commerce.

The supply association in the past four years has held regional expositions in five American cities. In 1919 its officials felt that the time was ripe to bring ice cream manufacturers together for a broad, sweeping view of the industry as a whole. Accordingly, the first National Ice Cream Exposition was held. More than 3,000 persons attended.

The national exposition is held in the Cleveland public hall, probably the most suitable building for the purpose in the country. It was built for exhibitions, at a cost of six and one-half million dollars. In this building are displayed types of all the modern machine-made supplies and equipment produced for the ice cream trade. Exhibits are handled in such a manner that any manufacturer may walk by the booths and look to his heart's content without having to buy anything or receive anything but the most courteous, thoughtful attention.

In the business sessions of the National Association of Ice Cream Manufacturers, which will be held in the ball room of Hotel Cleveland this year, delegates may hear constructive, informative speeches by men who have made a deep and earnest study of the ice cream manufacturers' problems.

All these things cost nothing but the traveling

es. The manufacturer gains in new knowledge and
ration. He gets a full view of this great industry,
possibilities and his own opportunities.

WE HEAR much about the National Ice Cream
Exposition and little about the men behind it.
event of this kind, as one naturally supposes, must
behind it men of big, broad, unselfish ideals.

Oliver C. Jordan is president of The Association of
Ice Cream Supply Men—big hearted, conscientious
"lie" Jordan. It would be difficult to find a sweeter
character anywhere. It would be more difficult to find
other man who so loves his industry and is so earnest
is desire to build it up.

Ollie Jordan is a man with a big, brave dream. He
owns a greater industry, yielding more to its members
the American public. He has struggled long and
delivering the gospel of co-operation, and the ice
cream exposition is the great pageant in which he has
ed to bring together the greatest possible co-operative
sure.

Mr. Jordan is fortunate in the assistance of Robert
Everett, secretary-manager of the supply association.
Isn't "Bob" Everett heard of more? The answer
is a modest gentleman who works hard and says
re. But men who have more closely watched the
association's progress know what "Bob" means to its
me. He is a young man with an old head, a virile,
vigorous charger of sagacious tactics.

Out of the plains of Kansas he emerged a few years
to take up work for the ice cream industry in New
York. Some day the industry will realize what it owes
this eager, earnest, sincere, unsmiling youth who
etly carries out his campaign plans behind modest
als. But it will never hear from "Bob" Everett.

CLEVELAND is ready. The word has come forth
that it has done its house-cleaning and has every-
thing ship-shape. Cleveland ice cream manufacturers,
with characteristic warm heartedness, are formally ex-
tending their invitation to ice cream manufacturers of
the nation through this issue of The Ice Cream Review.
This is not just a conventionally polite invitation; it
is a genuine one which comes straight from the hearts
of men four square and true blue. They love their in-
dustry and their city and they want every member of
the industry to see their city. They also invite manu-
facturers to visit their plants.

Cleveland manufacturers have every right to be
proud of their city. Their plants are among the most
modern in the trade.

You are sure to enjoy your visit to Cleveland.

BY LOOKING at the exhibits at Cleveland an ice
cream manufacturer can see any number of things
has needed for years and never knew it before.

LET'S BUILD UP—NOT TEAR DOWN.

AN INFLUENCE for bad is at work in the ice
cream industry.

There are those who would build themselves up by
tearing others down.

Forewarned is forearmed!

We invite the special attention of our readers to a
communication in this issue from one of the largest and
most successful ice cream manufacturers in the United
States. You will find his letter published on page 106.

A house divided will fall. The success of your busi-
ness and the success of our business depends upon giving
honest service to our customers.

In addition we must work for those ideals which tend
to establish confidence. Ice cream consumers must have
confidence in the ice cream business as well as in your
particular brand of ice cream.

You can't establish lasting confidence in your product
if you condemn the product of your competitors.

Folks must first be "sold" on ice cream before they
will stay "sold" on **your** ice cream.

Any man or any organization that deliberately seeks
to undermine public confidence in the ice cream business
in order to appeal to some particular class of manufac-
turers is guilty of treason, and should be dealt with ac-
cordingly.

The man who deliberately seeks to divide the ice
cream manufacturers into the "big class" and the "lit-
tle class," hoping to curry favor and thus build his busi-
ness is worse than a thief in the night. He destroys
confidence among men who should be working together
to build the confidence of their customers. He seeks to
array class against class with only selfish aims in view.
He is not entitled to the respect of decent business men.

We are glad that the good Lord made us boosters,
instead of knockers. We like the company we are in.

Men in the ice cream business, we believe you can
profitably give thought to this question. In your daily
walk of life spot the knocker and give him what he
deserves. At your conventions and at your district
meetings be a leader in clean thought and honest action.
Be on the side of decency and boost for the good that
is in men and in business instead of magnifying the
other things.

ONE of the features of the exposition will be the
meeting of the Salesmen's Club of The Association
of Ice Cream Supplymen, headed by Thomas J. Stewart.
This is one of the industry's most constructive organiza-
tions. It would be impossible to hold a great national
exposition without the assistance of the members of the
Salesmen's Club. Their boosting always gets results,
and they are ever willing to lay aside their own affairs
to take part in work for the industry's advancement.
We owe much to the young gentlemen in the supply
industry,—as also those not so young.

WHY should you go to Cleveland? In this issue we are publishing letters in which men who went last year set forth their reasons for going again. Read these letters. For sheer enthusiastic endorsement, they are most impressive. They breathe the fire of enthusiasm, the convictions of men who have been before and know what to expect again.

When you hire a man you want to know what his last employer thinks of him. In considering the coming exposition, it is only fair to see what men who **know** have to say. Read the letters published elsewhere in this issue and you will be sold on that coming exposition. They are not especially selected letters; just a bit of hand-picked correspondence from our files, where we keep our fingers on the heart beats of the trade.

WE HAVE before called attention to the fact that the National Association of Ice Cream Manufacturers is not properly appreciated. This is undeniably true. It is growing, but there are yet too many manufacturers not lined up with it.

The National Association stands for a greater, more prosperous industry. It stands against unfair trade practices that interfere with the progress of the industry. It calls upon every manufacturer who understands the value of co-operative effort.

Man does not live by bread alone. Neither does he live by his own efforts alone, nor by his own ideas alone. We need each other.

The National Association is working for the upbuilding of the industry. It now is helping manufacturers who, themselves, have done nothing in the common plan.

Its officers are men of the highest type—men of whom any industry should be proud. They are calling upon you to attend their convention. It matters not how big or how little is your business, how small or how great your attainments—they need you. And you need them and the work they are doing.

You have an appointment at Cleveland that should not be overlooked. It is an appointment with opportunity, and it is your duty to yourself and your industry to keep that appointment.

THERE will be many special trains to Cleveland. The usual fare and half-fare rates will prevail, and in this way money will be saved, whether you ride the special trains or not. But if you possibly can arrange it, be sure to ride a train with other ice cream men on it. It does every man good to talk over things with other men engaged in the same kind of business. It is a splendid way to "get next to" men and understand the things in their minds and—more important—in their hearts.

If you can ride on the same train with manufacturers from your own home-town, you'll learn more about them and develop a better understanding with them during that ride than you would in years back home.

IF YOU stay away from Cleveland everybody loses, but you lose most of all. Go and gain.

IT COMES to many of us in life to fall into some rut. Men sometimes make a big success in business and then get into a groove that holds them in a narrow, unchangeable course.

Of course, you don't think you are in a rut. You would be ready to quarrel with the first man who suggests such a thing. But just the same a little away from your own place to see what other men in your same industry are doing will quickly bring to mind a number of different things you could do better your own business.

That's one reason why you should go to Cleveland—a big reason.

THE 1923 Convention will mark the close of the second successive term of President Charles Morris. It must be with great pride that this gentleman looks back upon his record of association service. He has been a career of singular usefulness. Always identified in some way or other with the association's constructive work, Charles Morris has been a marked man since his early connection with the association—marked for service as it were. Possessed of those qualities which make for leadership and wise counsel, his influence has been well used for the association's progress in gaining the confidence of other manufacturers.

Such a man is valuable to this industry. His service is fully appreciated, and if he does step down this time to relinquish the reins of leadership to another, it is most comforting to know that he still will be on hand with his broad ideas and keen insight which make him so thoroughly familiar with the trade's problems and opportunities.

Something more than congratulations are in order for the close of this second term of splendid service. A vote of thanks is in order—deep, heartfelt thanks.

YOUR friends in the supply industry are interested in you. They have every reason for wanting to see you build up your business. They have drawn together in a body dedicated to this purpose—a body that seeks to eliminate from trade any product that could be detrimental to the industry.

You owe these friends your appreciation. You owe them your trust and confidence. By all laws of common courtesy you should show your appreciation. The way to do this is to visit their booths, look over their different products, and show them that your heart is with them.

They are not asking you to buy anything; they merely wish to demonstrate the various things offered for a bigger and better industry. It will draw volume publicity to ice cream as a great food confection.

We should be very proud of the men who can make possible such a magnificent trade classic.

*Electric
Weld*

Solderless Cans

80% *of Modern Plants Use*
"Electric Weld" Cans

In four short years, they have grown in popularity, until one season's production, if placed end to end, would reach nearly 90 miles.

Samples for next season are ready. They show added refinements in strength and appearance that you will approve.

If you come to Cleveland in October, visit our booths, numbers four and five. You will like the can, and be interested in a new money saving idea that will prolong the life of your cans.

JOHN WOOD MANUFACTURING CO.
CONSHOHOCKEN, PA.

PRESIDENT Charles A. Morris has called upon his home folks to help swell the attendance at the convention. He went before the New England association at its monthly meeting last month and issued his invitation to members. They responded by making preparations for a special train. It is interesting to note that Boston is 926 miles from Cleveland. So if you think you are going to have to travel a long ways to attend the convention just think of the gentlemen traveling from New England. The president will travel 828 miles from New Haven to Cleveland.

SPEAKING of distances to the exposition, what about the gentlemen coming up from California and the Southwestern states. Reports to The Ice Cream Review a short time ago were that a special train would carry members of the California and Southwestern States Ice Cream Manufacturers' Association to the exposition. Gentlemen from San Francisco will travel the farthest of anybody, covering a distance of 2,631 miles. Next in long journey will be the manufacturers of Los Angeles, who will take a little jaunt of 2,562 miles. Yet there will be a few manufacturers as near as 200 miles of the exposition city who will say they "haven't got time." Fortunately just a few, though.

A LITTLE boy was seen crossing a street with another little boy on his back, in a certain large city. The lad being carried was crippled. A man asked the little boy under the load if his passenger wasn't heavy. The reply was prompt and decisive: "No, sir; he ain't heavy; he's my brother."

That's the way, no doubt, the men doing the heavy work for the National Association feel. They struggle on and hope on, and help comes to them all too slowly. But they are sure of their purposes and they are strong in their love for fellow tradesmen. They know that what they are doing is for the good of the industry. They know it will benefit its members.

Sometimes, no doubt, their hearts grow heavy. It is then they probably tell themselves: "These men are our brothers."

It is of such spirit that comes great achievements. At times you may feel that your own load is heavy, brother, but if you'll just look around to reflect upon the burden of others, and then try to help them—your heart will be lighter. So will the burden.

BY ALWAYS staying at home you get the feeling that the world ends where your own horizon falls. Go to Cleveland this month and you'll find out that the world just begins where your own horizon drops—at least the ice cream world.

THERE'S plenty of fun for all; be sure to carry along the wife. It will keep you from having to hurry home before everything is over.

THE Welcome sign is sure to be found high and on Cleveland's doormat. Public officials have hands with local ice cream committees in preparation. The mayor may not be down to present the keys to the city, but Cleveland's dignitaries tell us that no key will be needed—the gates of the city will be open wide.

Howard Black of Cleveland is chairman of the ice cream men's Cleveland committee on preparation. Black held this post last year. His work there speaks for itself. Our observations of his work there give rise to the belief that he certainly has things set up for a highly interesting and entertaining visit.

Cleveland is proud of its ice cream exposition. Certainly will be no lack of welcome.

TAKE this issue of The Ice Cream Review along with you. If you want another copy provided with another copy. But take this copy with you. Read it on the train. Refer to it at the convention. It contains lots of information you will need. If you happen to forget it, drop around to The Ice Cream Review's booth and get a copy. Do not make this request merely for the honor and credit of The Ice Cream Review and its staff but because this issue contains important ice cream history. We are not publishing this extra issue with the idea of fitting ourselves but to benefit this great industry.

BULLETIN OF EVENTS

- National Association of Ice Cream Manufacturers**—Annual Convention, Cleveland, Ohio, week of October 22, 1923. Secretary, N. Loewenstein, 155 N. Clark St., Chicago, Ill.
- Association of Ice Cream Supply Men**—Second Annual Convention, Public Hall, Cleveland, Ohio, October 22-27, 1923 (inclusive). Roberts Everett, Secretary, 1328 Broadway, New York.
- Association of Ice Cream Manufacturers of Pennsylvania**—New Jersey—Annual Convention, Nov. 13 to 15, 1923. Hotel, Altoona, Pa.
- Ice Cream Manufacturers' Association of West Virginia**—Convention, Parkersburg, November 19 and 20. Convention headquarters, Hotel Chancellor. Secretary, C. F. Johnson, Huntington.
- Oklahoma Association of Ice Cream Manufacturers**—Annual Convention, Tulsa, November 21, 22 and 23. Convention headquarters Hotel Tulsa. Secretary, J. B. Porter, Tulsa.
- Texas Ice Cream Manufacturers' Association**—Annual Convention, Galveston, November 26, 27 and 28. Secretary, White, Mistletoe Creameries, San Antonio.
- Southern Association of Ice Cream Manufacturers**—Eleventh Annual Convention, Little Rock, Ark., December 4, 5 and 6. Convention headquarters, Marion Hotel. Secretary, Clopton, Decatur, Ala.
- Pacific Ice Cream Manufacturers' Association**—Annual Convention, Vancouver, B. C., Dec. 3, 4 and 5. Secretary, Walker, Tacoma, Wash.
- Arkansas Ice Cream Manufacturers' Association**—Annual Convention, Little Rock, December 3. Convention headquarters, Marion Hotel. Secretary, G. A. Meyer, Stuttgart.
- Association of Ice Cream Manufacturers of Iowa**—Annual Convention, Mason City, December 10, 11 and 12. Convention headquarters, Hotel Hanford. Secretary, P. N. Crowl, Good Block, Des Moines.
- Metropolitan Ice Cream Manufacturers' Association**—Convention, Newark, N. J., December 11. Convention headquarters, Newark Athletic Club. Secretary, W. H. List, Newark Ice Cream Co., 596 Market St., Newark, N. J.
- North Carolina Ice Cream Manufacturers' Association**—Convention, Winston-Salem, January 15 and 16, 1924. Convention headquarters, Robert E. Lee Hotel. Secretary, E. Dixon, Fayetteville, N. C.
- Kansas Association of Ice Cream Manufacturers**—Annual Convention, Wichita, January 22, 23 and 24, 1924. Secretary, B. T. Perkins, Pittsburg.
- Louisiana Association of Ice Cream Manufacturers**—Convention, Baton Rouge, sometime in January, 1924. Secretary, N. F. Manning, Monroe.
- New England Association of Ice Cream Manufacturers**—Convention, Boston, in middle of January, 1924. Convention headquarters, Copley Plaza Hotel. Secretary, W. P. B. Wood, 51 Cornhill, Room 401, Boston.
- Mississippi Ice Cream Manufacturers' Association**—Annual Convention, Laurel, some time middle of January, 1924. Secretary, N. D. Brookshire, Meridian.
- Western Canada Ice Cream Manufacturers' Association**—Convention, Moose Jaw, Sask., February 6, 7 and 8, 1924.

Approach Ice Cream Industry's Greatest Convention

President Says

By

Charles G. Morris

President
National Association
of Ice Cream
Manufacturers

ON the eve of the Cleveland convention we approach, if reports from Secretary Loewenstein and Secretary Everett are confirmed, the best convention ever planned for the ice cream industry.

I would commend to my fellow ice cream manufacturers a certain old Irish rune except for the last phrase. Not that I expect them to carry out the proposals of the rune in exact detail. Anyone who knows a bit of the Irish temperament knows better than to expect exact details of a consistent program to be prescribed in such a matter as verse, let alone a rune.

So I know it will prove a very talisman of virtue if you will but repeat in the brogue:

"Tim!" Sez'ee. "W'at!" Sez'ee.
"By this and by that!" Sez'ee,
"Gimme my hat!" Sez'ee,
"For I will go," Sez'ee,
"To Timahoe," Sez'ee.
"Go to the Fair," Sez'ee,
"Buy all that's there," Sez'ee.
"Before y' go," Sez'ee,
"Pay what ye owe," Sez'ee,
"Thin ye may go," Sez'ee,
"To Timahoe," Sez'ee,
"Go to the Fair," Sez'ee,
"Buy all that's there," Sez'ee.
"By this and by that!" Sez'ee,
"I'll hang up my hat," Sez'ee.

Then act on all but the final suggestion and the Supply Men will bless you.

To approach the subject in a more serious vein—it will only be necessary to say to those who were in Cleveland last year in order to assure their attendance that this year's exhibit covers double the space, and that we have as headquarters the Cleveland Hotel, which offers not only greater size but better facilities than did the Hollenden last year.

But it will hardly be necessary to say anything at all to those who were in Cleveland last year. I doubt if anything but death or disaster will keep them away. It is you, the backward few who have not yet learned what a national convention can do for your prosperity that this message is written. You will never know how true the call is that "the water's fine," until you too "C'mon in!"

Complete Program

National Association of Ice Cream Manufacturers

Twenty-third Annual Convention

Cleveland, Ohio
Hotel Cleveland

OCTOBER 22-23-24-25
NINETEEN HUNDRED AND TWENTY-THREE

[This complete program was announced by Secretary Loewenstein
on the eve of the convention. Delegates will be guided by this
program instead of the one printed on page 20 of this issue.]

P R O G R A M

OCTOBER 22, 1923.

9:00 A. M.

Registration.....Assembly Room "A", Mezzanine Floor,
Hotel Cleveland

10:00 A. M.

Meeting of Executive Committee and Board of Directors.

2:00 P. M.

Address of Welcome.....Hon. Fred Kohler,
Mayor of Cleveland

Response.....Mr. F. N. Martin,
Hazelwood Co., Ltd.,
Spokane, Wash.

Report of the Secretary.

Report of the Treasurer.

President's Address.....Mr. Charles G. Morris,
New Haven Dairy Co.,
New Haven, Conn.

"Edible Gelatine" (Illustrated by Lantern Slides).....Dr. T. B. Downey,
Fellow in Gelatine,
Mellon Institute,
Pittsburgh, Pa.

General Discussion.

"Advantages of Membership in a Trade Association".....Mr. L. W. Roszell,
Pres. Illinois Ass'n. of Ice Cream Mfrs.,

ATTRACTIVE AND EFFICIENT

GOOD DESIGNING both inside and outside, lends a two-fold advantage to your business. Sales increase and operating costs decrease. Can you afford to disregard a service which brings you this advantage?

For many years this organization has devoted its entire time to the planning of low operating cost Dairy Plants which have been accepted as models of efficiency by the industry.

Let us show you how your plant can be improved.

THE NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

Preparations Complete for National Ice Cream Exposition

Cleveland Patiently Awaiting Arrival of "Convention Specials"—Exhibitors Prepare Booths

CLEVELAND, O., October 10.—(Special to The Ice Cream Review.)—Preparations are complete for the National Ice Cream Exposition.

Local hotels report heavy advance reservations from ice cream manufacturers and ice cream supplymen over the country. Hotel Cleveland, selected for the headquarters of the National Association of Ice Cream Manufacturers, announces that it has booked its full quota for the exposition week, October 22 to 27. However, reservations are available at the Hotel Statler and the Winton Hotel.

Officials of the two national associations have visited the city and proclaimed everything in readiness. Secretary N. Loewenstein believes the National Association of Ice Cream Manufacturers will hang up a new record for convention attendance.

Roberts Everett, secretary-manager of The Association of Ice Cream Supplymen, says the exposition hall rapidly is filling up with exhibitors. Thirty thousand square feet of floor space will be utilized in the exposition, which will represent virtually every variety of modern machinery, supplies and equipment. Exhibitors during the past several days have been busy getting their booths to order. Shipments are arriving every day.

Heavy Traffic To Cleveland.

Railroad officials report special coaches are due to arrive at Cleveland from many parts of the country, two from the Pacific Coast, one from the South Atlantic States, one from Boston, and several from points in the Middle West. The schedules of arrival for these various coaches range from Saturday night, October 20, to the following Monday, the day of the opening of the exposition. Most of the delegates are expected to be here by the time the registration booths are to open at the Hotel Cleveland, in the ballroom of which hotel the convention sessions will be held.

In addition to the usual convention features, the exposition this year will be marked by extraordinary entertainment features. Probably never in the history of Cleveland conventions has there been such an effort

toward entertaining guests. Committees have been working on the different "fun-and-frolic" plans for several weeks. Local supplymen and manufacturers have joined hands in this connection, though the program has been directed by The Association of Ice Cream Supplymen committee, headed by Howard W. Black. The wives of local manufacturers compose a committee to see that visiting ladies have a good time.

Cleveland is ready. It is looking for an army of 4,000 manufacturers. This will be the largest attendance in the history of the ice cream industry, and every visitor will be catered for somehow. Hotels are crowded for the most part, but a way will be found to take care of every arrival.

The exposition will be held in Cleveland's \$1,000,000 public hall, open Monday noon, October 22, just after delegates have had ample time to procure their convention badges. It will close at 6 o'clock promptly each day, giving everybody a chance to take part in the various entertainment affairs in the evenings, dinners, banquets, theatrical parties, smokers, musical comedies, and virtually everything else in the line of fun.

EDUCATIONAL EXHIBITS TO FEATURE EXPOSITION.

Ice Cream manufacturers visiting the exposition will have the privilege of inspecting a comprehensive education section—a new feature in ice cream expositions.

Among other educational displays will be a very comprehensive one by the Federal Department of Agriculture. The department also had an elaborate display in the National Exposition last year.

A joint display is being prepared by the Ohio State University, the Department of Agriculture of Ohio and the Ohio Association of Ice Cream Manufacturers. There will be one by the University of Illinois; and one by the New York State College of Agriculture; and others are being added.

If you are tired of your business, don't worry over it. Advertise it for sale in The Ice Cream Review War Department.

Revised PROGRAM OF EVENTS

Convention Exposition Week

MONDAY, OCTOBER 22—

- 9 A. M.—Registration, National Association of Ice Cream Manufacturers, Hotel Cleveland.
- 12 M.—Second National Exposition Opens, Public Hall. Official welcoming by municipal authorities, and organ recital.

These Two Cabinets Set the See Them at Cleveland!

TO SAY that these two cabinets are tremendously successful is to put it mildly. For they have literally taken the trade by storm.

The underlying reasons for ice cream manufacturers' great preference for these cabinets are easy to find. The Grand Rapids Cabinet Company has always led by a wide margin in the furthering of ice cream cabinet efficiency and economy. And in these two models you see the height of their achievement.

The quality in these cabinets extends to every detail of design, material, construction and finish. Every Grand Rapids Cabinet represents the most thorough job that can be done. Instead of being sold on "points" these cabinets are sold on their proven ability to deliver most dollar-for-dollar value in the form of rock-bottom refrigeration costs, convenience and long life.

When you visit our exhibit in Cleveland and see how these remarkably efficient cabinets are constructed, you will understand why we say that our trade-mark is your guarantee of unduplicated quality. More important you will discover why that quality should be paying you dividends.

ESTABLISHED 28 YEARS

Cleveland Prepares for Royal Welcome

Exposition Hosts Extend Warm Invitation to Manufacturers of the Nation

A SHORT time ago The Ice Cream Review sent a representative to Cleveland with instructions to get full information on what is believed will be the most elaborate and complete welcome ever extended ice cream convention delegates. He called on Howard Black of The Widlar Company, chairman of the entertainment committee, but as soon as entertainment was mentioned Friend Black gave a first-class impersonation of the "proverbial clam." All he would say was, "We want to surprise them."

However a recent morning's mail brings us some important information that we know every ice cream manufacturer will be glad to hear. So here it is:

* * *

Hostess on the Job.

"Miss Rhode again will act as official hostess. Ladies who were at Cleveland last year know how much this charming little woman did to make them feel at home.

Miss Rhode will be assisted by a committee of ladies from each ice cream plant in Cleveland who will see that every visiting lady will be kept busy all the week. The day is gone when an ice cream man's wife or daughter has to sit alone in her room while her escort is at meetings. The idea of having a professional hostess was first brought out by The Association of Ice Cream Supplymen last year at Cleveland.

"The committee is making preparations for at least 500 ladies, so our best advice is—"If you have one bring her."

"Now, for the deep, dark secret. This year they will have a 'ladies' stag.' They will put on a show on Friday afternoon, October 26, for 'ladies only,' which will solve the question once and for all time, namely, what do our husbands do when they go to these supplymen association stags?

"The veil of mystery is going to be dropped and any lady who doesn't make her hubby stay at the convention until Friday afternoon will miss something."

* * *

Howard W. Black of Cleveland is chairman of the entertainment committee. He held the same job last year, and to him is attributed much of the enjoyment of the 1922 show. Cleveland committees have been most active in the past few weeks, and visitors are assured that they will be amply rewarded in amusement for making the trip.

No one is more enthusiastic over the march of the ice cream armies upon Cleveland than the Cleveland manufacturers. A number of Cleveland manufacturers have prepared messages of welcome. Here they are:

* * *

"WELCOME TO OUR CITY."

Words cannot express our pleasure in having with us again the ice cream manufacturers.

We are most proud of our city, and it is certainly gratifying that this great organization should again choose our town as its headquarters, and each dealer in this great city will strive to make your stay here most pleasant. Our \$10,000,000.00 Municipal Auditorium is a fitting place for this exposition. Our hotel accommodations are unsurpassed, and as for amusements—OH BOY!

For those of you who were not here last year, may we urge you to be with us this year, to the others, we know you will come.

May we extend to you all a cordial invitation to visit our plants, to use our offices as you see fit. Make them your headquarters, and if you want anything you do not see—ASK US.

W. E. TELLING, Pres.,
The Telling-Belle Vernon Co.

A "FIFTH CITY" WELCOME AWAITS YOU

May we say through the columns of The Review that our company jointly with the other ice cream manufacturers of The Fifth City feels it a distinct honor that Cleveland has twice in succession been chosen for the annual gathering of our National Association?

Again, and soon, we shall have the advantage of a personal, friendly and helpful exchange of ideas with you who have done the most to improve conditions in the industry! We all know by experience that the comprehensive work of our greater organization has been invaluable to its individual members.

There is still much to learn, and no doubt a great many things it will be mutually beneficial to unlearn; we are sure it is the desire of every member of our national organization to be of real assistance to another in ironing out ice cream difficulties!

We of Cleveland pledge our level best to repay you in October for the compliment of your second visit to us, and in our welcome shall endeavor to make you forget the extraordinary wear and tear of "that good old summer time" of 1923, which now has passed into history!

Sincerely and fraternally,

R. H. BAKER, President,

The Baker-Evans Ice Cream Co.

* * *

CLEVELAND FEELS HONORED.

It is almost impossible to describe the enthusiasm that the Cleveland ice cream manufacturers feel in looking forward to and arranging for the coming convention and exhibition that is to take place here in this city again this year.

I want to say that it is indeed a privilege and honor for any city to be chosen for this event, but to be chosen and honored twice in succession give us a pleasure and satisfaction seldom enjoyed by any city. Naturally we feel proud of our wonderful town and also of our low members for their good judgment in so selecting Cleveland to meet again this year.

I can assure you that the Cleveland ice cream manufacturers will leave nothing undone to make the convention this year a bigger and better one than last year's one. I don't want to go into the details of the arrangement committee, but I can safely say there is many a surprise awaiting those fortunate enough to come to Cleveland for this year's event. From all indications and reports there will be a greater gathering this year than ever before.

I have a letter before me now from "Al" Comeau of the Globe Ice Cream Co., Los Angeles, Cal., saying he will be here with "bells on," and every one that knows the "famous" "Al" will agree with me that there will be plenty of doings here during the convention week and if a great many members don't leave Cleveland in for another convention here mighty soon, it will be our fault.

Hoping to see you at the convention, I am

Sincerely yours,

I. BUDIN, President,

The Peerless Ice Cream Co.

MYSTERY EXISTS THURSDAY NIGHT TELL THE TALE

**Ice Cream Secret Will
Be Told At Danse Diable**

Every evening at the
Danse Diable.

Something that has never
before anywhere by

Something that has never
anywhere at any time
under circumstances.

Something that won't last
while it lasts will be
the best thing on earth.

Something you touch but that
won't touch long.

Something everyone every-
one will talk about after-

What is it? Be at the Danse
Thursday evening, Octo-

Hotel Rooms Finish Daily

**Write, Telegraph,
Now, for Yours**

For your hotel reservations

Even read the rest of
the paper—but send a telegram
directly to the Cleveland,
Hazen, Statler, Olmsted,
and other hotels ordering a
room.

Rooms in these hotels
are at a premium by the
time you receive this. Comfort-
able rooms with bath
and every appointment of con-
venience are available in all of
the hotels.

It is known that hundreds of
ice cream manufacturers have
been making reservations.
There are plenty of hotel rooms
in Cleveland for all, but those
who wish to live in one of the
best towns centrally located
must act at once.

It is the word of the Con-
vention Board of Cleveland,
which keeps an accurate check
on reservations.

Every Ice Cream Necessity Will Be In the 1923 Show

**Firms All Over Country
Sending Displays**

"The Practical University of
Ice Cream."

It will comprise 150 exhibi-
tors.

The leading makers and dis-
tributors of machinery, sup-
plies, equipment and special
services for ice cream.

Companies from coast to
coast, North and South.

New devices, improvements
of proved equipment, every va-
riety of supplies, working ma-
chinery, profit-making services.

Sixty thousand square feet of
area — the greatest exposition
for ice cream in history.

New Feature In This Show Never Before Included

**Important Educational
Displays Prepared**

For the first time in any ice
cream Show an important edu-
cational section will be a fea-
ture of the Second National Ex-
position.

The Federal Government will
have a display.

The University of Illinois
will have a display.

The State of Ohio, Ohio State
University and the Ohio Asso-
ciation of Ice Cream Manufac-
turers will collaborate in a dis-
play.

The Edible Gelatin Manu-
facturers of America, Inc., will
have an educational display.

There will be other displays
also, devoted not to the exposi-
tion or sale of goods or serv-
ices, but to educational fea-
tures solely.

This means that the results of
important research, of labora-
tory tests made by unbiased
students, and many facts con-
cerning mixes, refrigeration,
etc., etc., will be made public to
the whole industry.

In more than one sense the
exposition will prove "The
Practical University of Ice
Cream."

FRIDAY WILL BE BIGGEST DAY OF WEEK'S ENTERTAINMENT

Ladies Will See Latest Styles

**Fashion Show An At-
tractive Feature**

The exclusive shop of Bedell
will be the scene of the Style
Show for ladies on Tuesday
afternoon, October 23rd.

The Bedell Company is known
to the women of Cleveland as a
shop authentic in its styles
without being extravagant in its
prices.

All employees of Bedell are
familiar with a pamphlet, "Fif-
teen Points of Service" in which
the keynote is service to cus-
tomers and attention to their
convenience in shopping.

There will be special music,
special models and a showing
of a wide range of late style
creations at Bedell's for the
ladies of the ice cream indus-
try.

OPERA SINGERS WILL BE HEARD

**Famous Artists Appear At Tues-
day Banquet Also**

World famous singers of the
Cleveland Opera Company will
be at the annual banquet of the
National Association of Ice
Cream Manufacturers Tuesday
evening at the Winton Hotel.

These distinguished singers
will give gems from great
operas, solos, duos, trios, quar-
tettes, sextettes.

Their appearance is merely
one part of the great week's en-
tertainment provided by cour-
tesy of The Association of Ice
Cream Supply Men.

Fare and a Half

When you purchase trans-
portation ask the Agent for
a Convention Certificate for
attendance at The National
Association Convention. It
will entitle you to a half-fare
return ticket.

**Brilliant Sequence of Events
Scheduled Monday to
Saturday**

FINAL PROGRAM REVISION

**Highest Class of Entertainment
Will Be Seen**

Final revision of the week's
entertainment program now
projects Friday into the lime-
light.

The convention of the Na-
tional Association of Ice Cream
Manufacturers ending its ses-
sions Thursday, will leave ice
cream men a clear Friday to
devote to the Exposition, while
their wives and families enjoy
the greatest single day's enter-
tainment program of the whole
week.

Friday the Climax

Friday, in fact, so far as la-
dies' entertainment goes, is go-
ing to be the Pike's Peak of the
whole landscape.

Here is the Friday story now:
10 A. M.—"Ladies' Day" at
the Public Auditorium.

1 P. M.—Luncheon for ladies,
Winton Hotel, Rainbow Room.

2:15 P. M.—"Ladies' Stag"
—a dance review for ladies, as-
sisted by an orchestra of picked
soloists from the Cleveland
Symphony Orchestra, Winton
Hotel, Rainbow Room.

7 P. M.—Salesmen's Club
annual dinner, Winton Hotel,
Cameo Room.

8 P. M.—Ladies Opera Party,
Cleveland Opera Company's
performance of Faust, Audi-
torium, Masonic Temple, 3515
Euclid Avenue.

8:30 P. M.—"Man-about-
Town" evening begins. Private
entertainment parties through-
out city.

Other Revisions

Some other changes have
been made in the program of
the week.

They are: Monday, October
22nd, 10 A. M., ladies' registra-
tion. Mezzanine floor, Clevel-
and Hotel, Miss Ethel Rhody,

(Continued to Col. 2, Page 2)

Exposition Extra

Published for the promotion of the Second NATIONAL EXPOSITION for the ice cream industry to be held in Cleveland, Ohio., October 22nd to 27th, inclusive, 1923, by THE ASSOCIATION OF ICE CREAM SUPPLY MEN, 1328 Broadway, New York, N. Y., an organization of supply houses located from coast to coast, the salesmen of which houses enter every county in the United States and Canada, and all of which member houses and their sales representatives are bound by a Fair Practices Code to deal honestly with buyers. They are known by

THE SEAL

OF SAFETY

GOLF PRIVILEGES FOR INTERESTED VISITORS

Golfers Will Have Chance to Test Fine Course

The Entertainment Committee of The Association of Ice Cream Supply Men will have tickets to one of the best courses in the vicinity of Cleveland.

Inquire at the Entertainment Committee desk at the Public Hall for tickets.

THEATRICAL PARTY WEDNESDAY NIGHT

Ladies Also to Inspect All Facilities of Great Show House

Keith's Palace Theatre, to be the scene of a theatre party for ladies Wednesday evening, October 24th, is the most lavishly appointed theatre in the world.

Although it is not located in London, New York or Chicago, the world's largest cities, it is admitted to be the most beautifully equipped and most scientifically designed and constructed theatre, as well as one of the largest, in the world.

The ladies who will visit the theatre Wednesday evening will have the special privilege of a tour of inspection of the entire theatre.

LAST YEAR'S ENTERTAINMENT PROGRAM TO BE ECLIPSED BY FAR THIS YEAR; GREATEST OF COUNTRY'S ARTISTS FROM MONDAY ON WILL PERFORM FOR INDUSTRY'S

(Continued from Col. 4, Page 1)

hostess in charge; 2 P. M., ladies' tour of inspection, Second National Exposition, Public Hall.

On Tuesday, October 23rd, the Style Show at Bedell's will be at 2 P. M., instead of 3:30 P. M.

On Wednesday, October 24th, the Auto Tour of Cleveland and Lakeshore west with tea at the Clifton Club to begin at 2 P. M. instead of 2:30 P. M.

The matinee for ladies at the Allen and State Theatres will begin at 2 P. M. instead of 2:15 on Thursday, October 25th.

The other great events of the week were reported in the last Exposition Extra.

Remember Friday!

Few industrial gatherings have ever known a day so complete with distinctive entertain-

ment events as the ladies of the ice cream industry will discover at their disposal on Friday.

The visit to the Exposition in the morning will be at a time when the greatest show is at its height of color and activity.

The luncheon at the Winton is bound to be enjoyed.

Following it will be a great modern dance exposition — dancing *a la mode* of every sort, ballet, ballroom, Oriental, interpretive. The ladies of the ice cream industry have often expressed curiosity about the annual smokers of The Association of Ice Cream Supply Men. At the modern dance exposition they will see many of the dancing acts that will appear at the smoker Wednesday evening.

Grand Opera T

The performance of will be given by one of opera companies in the try. Among its artists are beth Amsden, of the Metropolitan Opera Company; Li- son, of the Metropolitan Company; Alma Peter the Chicago Opera Co Janet Watts, Francis Ralph Errolle, of the Opera Company; Joseph of the San Carlo Oper pany; Walter Wheatley Convent Garden Oper pany.

And Friday evening course, is "Man-About evening for the men.

Anyone missing events from morning night will have to make try on the loss side of the sure ledger for the week

Walter Wheatley; Elizabeth Amsden, Soprano; Ralph Errolle, Tenor; Francis J. Sadlier, General Dir Cleveland Opera Company; Janet Watts, Soprano; Joseph Royer, Baritone.

Cleveland, the Convention City

Will be Temporary "Ice Cream Capital" the Week of October 22-27

(Prepared by Convention Board, Cleveland Chamber of Commerce)

PROBABLY no city in the United States today outranks Cleveland in the stability of its growth. Approximately one million people live in Cleveland and its many suburban residential districts. Cleveland proper is the fifth city in the country in population and second to none in the possibilities for future growth and expansion.

This is made possible by Cleveland's exceptional geographical location and the resultant commercial advantages. The city's position upon the shores of Lake Erie midway between rich ore deposits of the Lake Superior region and the vast coal fields of Ohio, Pennsylvania and West Virginia, and close to the extensive limestone quarries of Ohio, make it one of the largest iron and steel centers of the country and this industry forms its leading activity.

Cleveland has convenient transportation facilities by rail and water and is situated where raw materials may be collected easily and at a low cost. It is the center of a wonderful market of unlimited production and buying power. Its thirty-five hundred manufacturing plants have an annual output exceeding \$1,091,000,000 in products.

Diversified Industries.

Cleveland's manufacturing is remarkably diversified, including the production of iron and steel; aluminum, iron, steel and brass castings, bolts and nuts; wire springs, wire fence and wire nails; tools and machine tools; hoisting and conveying machinery, screws and tacks; railroad supplies; stoves for oil, gas and coal; hardware; sewing machines; office furniture and multi-graphs; scientific instruments; chemicals; paints and

varnishes; oils and greases; automobiles, electric bobs; batteries and other accessories; and steel wire rods, barb wire, piano wires, electric wires, and wire ropes are produced in great quantities; wire platss, sheets and miscellaneous products go to make the balance of the big total.

Cleveland practically leads the country in the production of wire, nails, bolts and screws, malleable castings and heavy machinery. It has a high rank as a producer of tacks, drills, steam hammers, lathes, punch shears, forges, automatic screw machines.

Cleveland's position in the automobile industry is not confined to the production of cars. The city leads in the production of automobile parts and accessories.

Expansion of the automobile manufacturing in Cleveland has been one of the city's most recent developments. Pure cars manufactured include Chandler, Cleveland, Grant, Kurtz, Automatic, Jordan, Hless, Stearns, Kling-Knight, Tiplar and Win The Grant, Peer and White tr

A Cleveland Downtown Scene.

are made in Cleveland. The development of this industry has had no mushroom features but is the result of the recognition by motor car experts of Cleveland's logical advantages.

Cleveland is the second city in the country in the production of women's ready-to-wear garments and has become a leader in the endeavor to raise this industry to a higher plane to stabilize it and produce garments which are more enduring in style and of a quality which appeals to the great majority of American women.

For the last twenty years Cleveland has been the leading city in the United States in the manufacture of vari

THE NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

Many of Cleveland's Theaters and Large Movie Houses Are Conveniently Grouped in Playhouse Sq., Euclid Ave. and E. 14th St.

and paint and the two largest paint companies in the world are located here. The output of refined oil totals 1,000,000,000 gallons annually.

A number of miscellaneous products aid in the importance and development of Cleveland. It is one of the largest hardware producing centers in the United States. There are several large manufacturers of steel office furniture, printing presses and paper cutters. The only multigraph manufacturing concern in the country is located in Cleveland. Only one city in the United States produces more sewing machines than this industrial center. Plumbing supplies, railroad frogs and crossings, kitchen utensils, washing machines, aluminum wares, lamps, lighting fixtures, roofing materials, toilet articles, toys, rubber goods, and small novelties are manufactured in vast quantities.

In 1876, Charles F. Brush, a Cleveland citizen and inventor, gave his first demonstration of his arc lamp in the public square in Cleveland. From Cleveland, too, a mighty influence is exerted upon lighting problems of the world, for here is located the headquarters of the National Electric Lamp Association. Executive offices and the laboratories of this company occupy a beautiful tract of seventy-five acres, known as Nela Park. It contains buildings for administration, research, engineering and operating. It stands forth pre-eminently as a seat for scientific research work. From the laboratories come reports and testimony at frequent intervals of innovations, improvements and corrections of electric lighting devices.

Lake Frontage.

CLEVELAND has 14.2 miles of lake frontage, protected by a breakwater $5\frac{3}{4}$ miles in length, constructed by the Federal Government at a cost of approximately \$6,000,000 with an additional \$1,000,000 expended in dredging and maintenance. The harbor has a spacious entrance, and the extension of East 9th St. has made possible the construction of

two passenger piers affording ample age for passenger and freight service to Detroit and Buffalo. These docks are located east of the harbor entrance, while the harbor to the west affords unexcelled facilities for handling and storage of iron ore. Cuyahoga River, which is navigable for several miles and flows into Lake Erie at land, is also lined with docks adjacent to which are many furnaces, factories and lumber yards. Many of these docks are equipped with ore handling buckets having a "grab" of ten, seventeen and twenty tons of ore. An ordinary ore car may be unloaded by 1 "grabs" of a single bucket.

At a special city election the erection of a new Union passenger terminal by the Cleveland Union Terminals Company was authorized. This station, the estimated cost of which is \$50,000,000, is planned to occupy the property fronting on the Public Square between Ontario St. and Hotel Cleveland, extending along the west side of Ontario St. from the Public Square to Huron Road and using the area between Huron Avenue and Canal Road as far west as Columbus Road.

There will be two levels for trains, the upper for steam roads and the lower for electric interurban trains. Between the levels will be a concourse by which passengers may reach trains, change trains or transfer from a railroad train to an interurban car. Plans provide for 15 tracks on each level with a future extension to 30 tracks. The station will also connect with the proposed subway terminals under the Public Square. All roads entering the depot will be electrified.

Cleveland is served by eight steam railways—B. & O., The Cleveland, Cincinnati, Chicago and St. Louis (Big Four), Erie, Lake Erie and Pittsburgh, New York Central, New York, Chicago and St. Louis (N.Y. & N.E. Plate), Pennsylvania Lines and the Wheeling & Lake Erie. Interchange of traffic between these railways is made possible by the Cleveland Short Line Railway, recently completed at a cost of \$20,000,000. It makes a circuit of 19 miles around the city, intersecting every railway at a point near the yards of each, and without crossing at grade any of the street railway lines on principal thoroughfares. The belt line affords

Cleveland Public Square.

"Find a Flavor That is Finer Than Vanilla"

THE story is told of an old confectioner who, when asked by an ambitious young friend in the same business, "How can I make a finer ice cream than any made today?" replied, "All you have to do is to find a flavor that is finer than vanilla."

Many people have tried to crack that nut,—but the majority vote for vanilla only grows bigger every year.

If you want the BEST vanilla, "the flavor that makes reputations," you must use the bean itself, properly developed as it is in

MICHAEL'S MEXICAN VANILLA POWDER

No other bean is quite equal to the Mexican, and no extract or other form is quite equal to our powder.

Come to the Cleveland Convention, and drop in at our booth, No. 62, lower floor. We shall have an exhibit there with which we can explain some points about our Mexican Vanilla Powder that will throw light on the great question, "How can we make a finer ice cream?"

Composite View of Art Museum.

Cleveland wonderful shipping facilities and authorities say it is the shortest and most convenient belt line and with the easiest grade in any large city in America.

One of the world's largest and most efficient freight stations is the Orange Ave. freight terminal of the New York Central Railroad, located at Orange Ave. and East 14th St. Completed in 1918, the terminal freight house has unusual special features and labor-saving equipment including handling freight by tractor trailer method. A three and one-half mile branch from the Belt Line, with 1,000-car yard, serves the plant.

* * *

Good Hotels.

CLEVELAND is bountifully supplied with modern, splendidly equipped and centrally located hotels, in which good rooms always may be obtained at moderate rates. Two of Cleveland's hotels are the largest in Ohio and contain one thousand rooms each. Another has 850 rooms and another 600, while several have 300. Spacious and especially designed assembly rooms, banquet, registration, committee and private dining rooms to fulfill all requirements are features of the larger hotels. Approximately 6,500 rooms are available in the downtown district.

The Cleveland Chamber of Commerce enjoys a high reputation for its activity and is closely identified with all of the city's important developments and achievements. In addition to its many departments, the following are the principal subsidiary organizations:

Bankers' Trade and Acceptance Council; Convention Board; Cleveland Safety Council; Flour Club; Grain and Hay Exchange; Manufacturers' and Wholesale Merchants' Board; Military Committee; Retail Dealers' Board; Retail Merchants' Board.

The Convention Board of the Chamber of Commerce is engaged actively in bringing conventions to Cleveland and in aiding members of organizations in the successful conduct of their conventions. It also engages

DON'T FAIL TO VISIT BOOTH NO. 72
AND EXAMINE THE COMPLETE LINE
OF *ECONOMY CABINETS*. MAKE
OUR BOOTH YOUR HEADQUARTERS.

Economy Cabinets

Dry Package Cabinet

Most efficient dispenser of Brick carton, dry bulk package, or Eskimo Pies. Each package goes to the customer in perfect condition having had superior refrigeration in a container totally surrounded by ice, in a cabinet heavily insulated with cork.

New Corkboard Cabinet

The manufacturers have come to realize that superior insulation means money saved on ice consumption. This tapered cabinet has an average of 3" corkboard on the side and 4" on the bottom, lined on both sides by water-proofing paper. Equipped with $\frac{7}{8}$ " buffer board to protect bottom of cabinet, making a cabinet that is far superior to ordinary styles.

Tub Cabinets

This separate compartment cabinet is especially designed for rural trade, as one compartment alone can be used without being compelled to ice the entire cabinet. The tubs of the cabinet are especially treated to prevent leakage.

ALL Cabinets finished in highly polished mahogany.

in extensive advertising of Cleveland through magazines, publications and newspaper articles.

Popular Convention City.

CLEVELAND is fast becoming one of the most popular convention cities in America.

Its geographical location, which permits the majority of the inhabitants of the country to reach it over night, makes it an ideal convention center. Through over-night trains, with finest Pullman standard sleeping cars, are operated daily into Cleveland from Detroit, Chicago, St. Louis, Cincinnati, Pittsburgh, Washington, Baltimore, Philadelphia, New York, Boston, Buffalo, Toronto, and many intermediate points, while through sleeping car service is also available during winter months from Atlanta, Birmingham, Chattanooga and Jacksonville.

The remarkable growth and development of Cleveland has never been accelerated by any pronounced boom, but is rather an outcome of a continued and persistent healthy growth, also the result of remarkable expansion and development of its civic, industrial, commercial and financial life.

The original mould in which Cleveland was cast was of the New England pattern. The lands in the north-eastern corner of Ohio had been granted by the United States government to Connecticut, after the Revolution, in the settlement of claims made by the seaboard states to western territory, under old colonial grants. The state sold the larger part of its possessions in Ohio to a group of Connecticut men known as the Connecticut Land Company. In 1796 that corporation sent a party of surveyors headed by General Moses Cleaveland to

lay out a town site at the mouth of the Cuyahoga River. The embryo city was named after its chief founder. After the usual hardships and discouragements of settlement in the wilderness, Cleveland began to gain headway about 1830, when its population still numbered 1,076. In 1836 the town was incorporated as a city. The census of 1840 showed that it contained over 10,000 residents. By 1850 the population was 17,000 and at that time the rise of Cleveland was very rapid. The period 1855 to 1860 saw the beginning of manufacturing in Cleveland. Prior to that time shipping and building were the principal business activities, from wholesale and retail merchandising. Since then Cleveland has risen from the rank of fortieth city in population in the United States to fifth city in 1920.

Cleveland more than doubled its population during several of the government's ten-year census periods. It multiplied it by five in forty years, because of the location of the city affording remarkable facilities for manufacture of iron and steel and their products, for the transportation of heavy freight by water, at the lowest possible cost, and because Cleveland is the natural business center of a rich and favored region.

Cleveland has always been an orderly and thrifty city, notable for its large and numerous savings banks, its devotion to schools and colleges, libraries, and art, all, for its home life and healthful environments. It is the fourth city in the United States as a financial center. Its choice as the location of the Federal Reserve Bank for the fourth district was made not only because of what it has accomplished, but also because the future bids fair to become increasingly important.

Delightful Climate.

THE climate of Cleveland is of the kind which is proved most favorable to the full development of modern civilization. The seasons are strongly marked but the waters of Lake Erie temper the extremes of winter and summer, delay the frosts of autumn and hold back the vegetation in the spring enough to make fruits more dependable than they are a little farther from the shore of the lake.

These conditions have a favorable influence upon the health of a city long noted for its low death rate. Its natural drainage is excellent and the broad streets swept by winds which carry away the atmospheric impurities inseparable from the life of large centers of industry and trade. But the remarkable small mortality is also due in part to the exceptionally large proportion of vigorous young men and women who grow up here to so prosperous and attractive a city.

Few cities have been so favored by gifts from nature to their own citizens. The park system, which has hardly a rival in America for extent and for the variety of natural beauty and attractions, is the outgrowth of the able giving by Cleveland men.

Beautiful Parks.

PARKS and boulevards extend in a great circle around the larger part of the city, lacking only a few connecting links to make a complete girdle of green in summer. Gordon Park and Edgewater Park, the latter on the West Side, as the great section west of the Cuyahoga River is called, reserve for the people for two miles on the lake front and provide bathing and boating facilities and playgrounds swept by cool breezes in summer. There are nine parks with from 85 acres to nearly 300 each, and the park system includes numerous smaller parks and many miles of boulevards.

Each Year Brings Bigger Demand for Mapleine Ice Cream

Give the consuming trade Mapleine Ice Cream, and sales grow. Mapleine is that kind of flavor. The public likes it.

Manufacturers who try out Mapleine Ice Cream as a week end special, soon find it not only a leading week end flavor, but experience a bulk demand so good that Mapleine becomes an every day staple.

And 1-6/10c per gallon is all that it costs to flavor with Mapleine, so it pays to have Mapleine Ice Cream one of your best selling flavors.

Send us a trial order

If you are not thoroughly pleased, write us and we will mark the bill paid. Convince yourself.

ravines, natural waterfalls, fine old forest groves, pretty streams and the shore of a great lake combine to give these pleasure grounds rare charms for lovers of nature.

Many resorts outside of the city, especially along the shore of Lake Erie, add to the warm weather attractions of Cleveland. Seven lines of interurban railroads spread like a fan from the center of the city and afford easy access to numerous pretty towns, lake and river outing places.

* * *

Unique Group Plan for Public Buildings.

AN AGGRESSIVE civic step which has attracted world-wide attention to Cleveland is the group plan for public buildings. A "T" shaped tract of land approximating 104 acres in the heart of the city, and known as the "Mall," will ultimately contain all of Cleveland's municipal buildings. The Federal Building, costing \$3,870,000, the Cuyahoga County Court House, costing \$4,500,000, and the City Hall, costing \$3,330,000, are already occupied. Appropriations are outstanding for a public library and a Criminal Court building upon the "Mall." The completed project will represent an outlay in excess of \$35,000,000.

The Public Hall, opened in the Spring of 1922, also located on the "Mall," constitutes another unit of the "Group Plan." Its auditorium accommodates 12,500 persons, while upwards of 70,000 square feet of floor space is available for exhibits. The acoustics of this mammoth auditorium have proven ideal. Exhibit engineers have proclaimed its exhibit facilities to be the finest and most serviceable of any similar building in the United States.

In the country, about 8 miles from the center of the city, Cleveland has already created a very different

group of public buildings. On a farm of more than 2,000 acres on high land a fine sanitarium for tubercular patients, a home for aged and infirm, with cottages where old couples can spend their last years together and all the necessary buildings to make such a farm complete, stand as a monument to the generosity and kindness of the people of Cleveland. Upon the same tract of land is the municipal house of correction with ample fields about it for outdoor work and shelter for winter employment.

Cleveland, as the center of the Western Reserve, many points of interest of national importance. As the home of many of the country's great men, both politically and industrially, the eyes of the nation have always been upon Cleveland.

This was the home of James A. Garfield, at one time president of the United States. The Garfield Memorial, built by national subscription, is one of the famous memorials of the country. The residence of John Hay, Secretary of State under McKinley, was in Cleveland. His burial place is in Lake View Cemetery. Tom L. Johnson, nationally known as the Father of the Three-Cent Street Car Fares, was mayor of Cleveland for several terms. Marcus A. Hanna, at one time United States Senator and national figure, resided in Cleveland and a massive monument has been erected to his memory. John D. Rockefeller, oil king and philanthropist, laid the foundation of his fortune and spent the greater part of his life in Cleveland, and his estate here is one of the show places of the city. Cleveland is also the home of Newton D. Baker, former Secretary of War.

A permanent city planning commission helps the city toward right decisions on proposed reforms, housing, transportation, recreation and other public welfare matters.

* * *

No Congested Areas.

THERE are practically no areas of congested population in Cleveland, as the city is noted for its great number of home owners. According to the 1910 Federal Census, 35 per cent of Cleveland homes were owned by the occupants, being second of the American cities in this respect.

The city's education facilities are notable. In the city system are 110 grade schools, twelve high schools of which three are technical high schools and nine junior high schools. Parochial schools number fifty-seven.

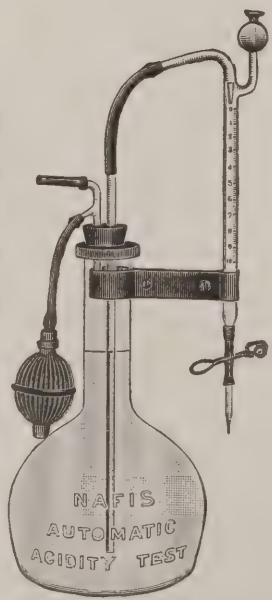

Cleveland is the seat of Case School of Applied Science, Western Reserve University (including the College of Women), and of St. Ignatius College. Case offers courses in civil, mechanical, electrical, mining, metallurgical and chemical engineering and physics. Western Reserve has in addition to Adelbert College, schools of medicine, law, dentistry, and pharmacy, and courses in education and applied social science. St. Ignatius confers baccalaureate degrees and gives courses in philosophy, language, literature, history, science and mathematics.

Following the Cleveland principle of making community enterprises really serve the community, the Public Library has forty-six branches and 590 distributed. In gross circulation of books, the Fifth City ranks third in the United States, and in per capita circulation, first.

Visitors reaching Cleveland by railroad are deeply impressed at the Magnitude of the city's manufacturing districts, through the miles upon miles of factory fringing upon the railroads. But upon reaching the downtown mercantile district the visitor is at once filled with awe at the activity and splendor which meets the eye.

It is understood that if I decide to order an Everhot equipment from you, it will be subject to final acceptance after inspection and trial.

from all sides. This is especially true of Euclid Ave., the principal retail mercantile street, famous the world over.

Magnificent Shipping District.

PROBABLY nowhere outside of New York City is there a more magnificent shopping district than in Cleveland. Wide streets accommodate the tremendous vehicular traffic and broad sidewalks permit the rapid passage of the hundreds of thousands who throng this district daily.

But above all, is the remarkable transformation which has occurred in this district during the past few years. Business houses have spread out over a larger area and have moved eastward along Euclid Ave. and adjacent thoroughfares; magnificent buildings have been erected; the very latest of designs in store architecture have been followed; store windows, so attractive that they compel the passerby to tarry and view their artistic displays, exhibit the latest styles and creations of this country and of Europe.

In Cleveland today are many of the finest retail stores and restaurants in the United States. Merchants, as though spurred by the incentive that wide streets and sidewalks and magnificent buildings offer, have

striven to outdo one another in making their establishments attain perfection in beauty and artistic decoration. This thought is unconsciously conveyed to visitor and the result is that Cleveland's shopping district has become nationally famous.

High Class Amusement Houses.

THE same idea has been carried out by theatre enterprises and in 1920 seven elaborate playhouses were erected augmenting Cleveland's previous ample facilities for the amusement of theatre lovers. These playhouses, for the drama, vaudeville and motion pictures, are the last word in architectural design. F. Keith's new Palace Theatre has been pronounced the finest in the world. Four of the new theatres are located in the upper section of Euclid Ave. recently occupied by mercantile establishments. These theatres, which all provide more than 11,000 seats, are within the same block, now known as "Playhouse Square."

After a busy day in the manufacturing districts at convention sessions, the visitor to Cleveland can easily find restful pleasures to occupy the evening hours for notwithstanding the city's phenomenal growth in population and industry, its facilities for healthful pursuits and wholesome recreation have kept pace.

PHILADELPHIA EXPECTS TO PRODUCE 63,000,000 GALLONS OF ICE CREAM THIS YEAR.

Philadelphia has become the center of manufacture for the greater part of the ice cream consumed at Jersey coast resorts and a large surrounding territory and is estimated today that nine plants there, costing \$1,000,000, will turn out 63,000,000 quarts of cream this year. Some abandoned breweries have been transformed into ice cream factories.

SALESMEN'S CLUB TO MEET.

The Salesmen's Club of The Association of Ice Cream Supplymen will hold its annual meeting Friday, October 26, at the Winton Hotel, Cleveland, according to announcement by Thomas J. Stewart, president.

The Salesmen's Club generally meets the first day of the exposition, but this year decided to defer the meeting until such evening as they could meet at a dinner without interfering with the regular program.

A feature of the meeting will be the awarding of prizes to winners for the past year. Officers and directors will be elected. "Snappy talks" on salesmanship by nationally known speakers are promised.

Views on National Ice Cream Exposition

Manufacturers Who Attended Last Year's Exposition Tell What to Expect at Cleveland this Month

THERE are so many good things promised for the Second National Ice Cream Exposition we decided to ask some of the gentlemen who attended the Cleveland show last year to tell our readers their views upon the coming event.

It is generally known that the exposition is held in connection with the twenty-third annual convention of the National Association of Ice Cream Manufacturers. The exposition is being directed by The Association of Ice Cream Supplymen.

This organization started holding ice cream exhibitions on a sectional scale five years ago. It was not till last year that it decided upon a national exposition. Cleveland was selected because of its central location and splendid exposition facilities.

Results of last year's show more than vindicated the supply association's judgment both in selection of city and in the belief that the manufacture of ice cream has become a nation-wide industry and was ready for such a stupendous education venture. Before exhibiting at Cleveland the association had held expositions of a regional nature in Philadelphia, Atlantic City, Buffalo and Atlanta.

Ice cream manufacturers who attended last year's show are convinced that the national show is an event of great helpfulness to the industry and should not be overlooked by anyone interested in the upbuilding of his own business and the advancement of the industry.

The men who attended the exposition last year know what to expect this year. Not in the history of the industry has anything aroused such enthusiasm as is now felt over the pageant to take place at Cleveland the week beginning October 22.

Manufacturers last year brought from the convention sessions of the National Association of Ice Cream Manufacturers some splendid points concerning business methods and trade practices. At the exposition they saw a startling array of the most modern machinery, supplies and equipment for building up the prosperity of the industry.

It opened the eyes of manufacturers to the possibilities of the ice cream industry.

Let the gentlemen who attended last year's exposition tell their own stories. Here they are:

EXPOSITION WORTH MONEY TO EVERY MANUFACTURER.

I AM going to the convention for the reason that I feel it is my duty as an ice cream manufacturer to always attend the national conventions. I do not feel that it is my duty to the national association to do this as much as I believe that it is my duty to the business that I represent. I feel that any ice cream manufacturer in this country who does not attend the national convention and the supplymen's exposition is losing the most wonderful opportunities that can be had.

First, the opportunity to meet the great army of men who are identified with the ice cream industry and to discuss your own problems and their problems with them is worth more money to the ice cream manufacturers in dollars and cents than any other thing that happens to him during the year.

Second, the opportunity to visit the supplymen's exhibit and the abundance of time one has to look at the wares and have every little thing thoroughly explained is certainly worth many dollars to the ice cream manufacturer and the opportunity that the supplymen's exhibit gives him to make comparisons of the different equipment and supplies that he uses in his business without question a very valuable thing for any ice cream manufacturer.

Third, the opportunity to sit in the national convention hall and to listen to the discussions on all of the intricate problems that confront the ice cream manufacturer, and the wonderful arrangements of subjects are put upon the program for these discussions to enable every ice cream manufacturer to take advantage of all the latest and most up to the minute facts and ideas, cannot be figured in its value in dollars and cents.

Fourth, every ice cream manufacturer today must be in a position to be posted on the very latest and best ideas that are developed in the ice cream industry to be able to hold his own with the wide-awake competitor who is taking advantage of every opportunity to learn and know how to conduct his business on a higher standard and a more profitable basis every year.

I would say that the ice cream manufacturer who neglects to attend the convention is losing all of the advantages that are handed to him on a silver platter to help him to have a better knowledge of his business and a better knowledge of the way of doing business; therefore, LET'S ALL GO and meet all of the good fellows that are willing to tell you all they know about the business for the asking.

Sincerely and cordially yours,

JOHN SEMON

Semon Ice Cream Co., New Haven, Conn.
Director National Association of Ice Cream Manufacturers

* * *

"WOULDN'T MISS IT."

ONE of the compelling factors in our small success in the milk and ice cream business, has been the traveling salesman. Nearly every "Man Jack" who comes to them offers suggestions and criticisms, which are helpful to the man who can sort out the good from the bad.

The salesman who induces the small tub freezer manufacturer to buy a regular horizontal brine freezer is doing said small ice cream manufacturer an immense amount of good. And so it is with the larger plant; the salesman points out, in various ways, how a certain piece of machinery will reduce the overhead, and the reduction of overhead is of the utmost importance to us.

The writer would not miss the ice cream show at Cleveland for a great deal, because it gives us all a chance to check up on the new developments in the industry, and the man who does not keep up with the march of progress is not doing his utmost for the future prosperity of his business.

Personally, we manage to have a wonderful good time at these conventions, the good fellowship which prevails is well worth the cost of the trip.

CHAS. J. REYNOLDS

ADVERTISING IN THE ICE CREAM REVIEW IS A GUARANTEE OF MERIT.

"Take Your Trade Paper Into Partnership"

By R. Lee Sharpe

"By jimminy, I get peeved the way some business men treat their trade journals. They render an invaluable service in their special fields. They promote efficiency and economy. They offer information which cannot be secured elsewhere. They work in season and out of season for the special field to which they are devoted. **THEY USUALLY REFLECT THE VERY BEST OF THE INDUSTRY THEY SERVE.**"—Evan Johnson, Editor Office Appliances, Chicago.

"**W**HEN I took my trade paper into partnership prosperity seemed to come my way," said a successful business man recently. Let him tell the story:

"When I first began business I treated my trade paper with that indifference usually accorded a step child—until one day I suddenly waked up. It was at the close of a warm July afternoon, and in my haste to get rid of details to leave for home, I tossed the current issue of my trade journal at the waste basket. It missed it's mark and fell open on the floor. In stooping to place it in that ever yawning receptacle my eyes caught the heading, 'Why Business Men Fail.'

"I became interested in the article, and read it before moving from my chair. That night, in the quiet of my home, around the evening lamp, I took a delightful trip through the whole magazine.

"To my surprise I found much that I could use in my business—and I learned 'why some business men fail.' Now I make it my steady job to go through each issue thoroughly to get ideas and plans which I can use in my business. And, I honestly believe the reason prosperity came my way, was because I took my trade paper into partnership—for I strike pay dirt often—mighty often in its columns."

* * *

We know many successful business men who are eager and impatient for the day when the postman puts their favorite journal on their desks. You don't find these men tossing their trade journals into the waste basket, for,

as leaders and executives in their special lines, they always have time to learn something new about their business and its problems.

But there is, nevertheless, always a large percentage of the unelect in any family or trade. They seem to take their trade paper as they "take" their pills or cough syrup. They evidently have good intentions when they subscribe, or else want to 'put up a front' and be able to say that they take such and such a journal. That is all the good they ever get out of the transaction, because they fail to give their trade paper a chance to help them with their business problems.

The growth of the trade paper in the past few years has been marvelous. It is coming to be more and more the successful business man's partner and associate. It supplies him with ideas, and gives him plans he needs and must have in these days to keep up with modern business.

E. C. Simmons, the "hardware prince" who made "Keen Kutter" famous around the world, once said: "I spend an hour each day in quiet study of our business problems, and MY TRADE PAPERS give me the angles on how the other man solved these problems, and I have found this quiet hour the most valuable time in my business life."

PROSPERITY USUALLY GOES HAND IN HAND WITH THE MAN WHO HAS THE ABILITY TO AVAIL HIMSELF OF THE THINGS WHICH THE OTHER MAN HAS LEARNED—WHO TAKES HIS TRADE PAPER INTO PARTNERSHIP.

VIEWS ON NATIONAL ICE CREAM EXPOSITION

(Continued from page 38)

"IT HAS HELPED US."

THREE members of our firm will be present at the Cleveland show, from our experience at the conventions. Every man engaged in the ice business, whether large or small, should not miss it, the benefits derived cannot be spoken in words.

It has helped us a great deal and we advise every one to attend that has this great growing industry at heart.

We would not allow ourselves to be absent and also wish to add, with congratulations to our friend Ollie Jordan and his staff, for helping to make the cream business what it is today. We also will add our congratulations to The Ice Cream Review and The Cream Trade Journal for the part they played in bringing about the growth of this giant industry.

Hoping to meet all the boys at the show, we are

Yours very truly,

MARYLAND CREAMERY CO.

M. Jacob Abrams, Pres., Baltimore, Md.

* * *

"SURE WE ARE GOING."

SURE we are going to the convention in Cleveland. Our Mr. F. N. Brumbaugh of Harrisburg, Pa., will represent us.

As to why every manufacturer should go—well, remember the story of some three blind men and the first elephant. One felt the trunk and thought the elephant was like a rope; another felt the side and thought the elephant like a barn; another felt his foot and thought the elephant like a tree trunk.

If we stick too close to our business and do not get a broad view of it we are inclined to get as wrong an idea as the blind men had of the elephant.

That is the purpose of expositions and conventions—to get a view of our industry in perspective, which will enable us to analyze our problems properly.

Yours very truly,

SUGAR CREEK CREAMERY CO.

G. C. Mahle, Sec'y-Treas., Danville, Va.

* * *

"WORTH THE TRIP."

AM I planning to visit the big ice cream show and convention in Cleveland in October? Well, yes, just tell them I am.

You know I have been attending ice cream conventions for quite some time, but for a real honest to goodness convention the one at Cleveland had them all beat.

And then the display that the ice cream supply men put on. That alone was well worth a trip clear across the country.

You just put it down, please, that I will be there and that I will also boost for it and try to get as many ice cream men and their ladies to go as I possibly can.

W. A. SCHWINDELER
St. Louis, Mo.

* * *

"GOING AGAIN."

YES! I am going to the convention again this year as usual, and I am going for the same reason I have gone other years.

In the days gone by, when I could not well afford it, it seemed to be a gamble, and somehow or other I always won, receiving big odds.

INDUSTRY'S EFFORTS TO FIND CULMINATION IN GREATEST OF PROGRAMS, ANNOUNCED FOR WEEK; NEW EXPOSITION-CONVENTION-SOCIAL DETAILS

THE GREAT WEEK'S PROGRAM OF EVENTS

MONDAY, OCTOBER 22nd

- 9:00 A. M.—Registration, National Association of Ice Cream Manufacturers, Hotel Cleveland.
- 12:00 M.—Second National Exposition opens, Public Hall. Official welcoming by municipal authorities and organ recital.
- 2:00 P. M.—Session, National Association of Ice Cream Manufacturers.
- 8:30 P. M.—Informal reception to ice cream manufacturers and their families by The Association of Ice Cream Supply Men. Entertainment and refreshments. Ballroom, Hotel Cleveland.

TUESDAY, OCTOBER 23rd

- 9:00 A. M.—Session, National Association of Ice Cream Manufacturers.
- 3:30 P. M.—Fashion Show and Tea, for ladies, Women's City Club.
- 7:00 P. M.—Annual Banquet, National Association of Ice Cream Manufacturers. Entertainment courtesy The Association of Ice Cream Supply Men. Rainbow Room, Hotel Winton. Dancing afterward, Cameo Room, Hotel Winton.

WEDNESDAY, OCTOBER 24th

- 9:00 A. M.—Session, National Association of Ice Cream Manufacturers.
- 2:30 P. M.—Motor ride over Eastern Boulevard, for ladies.
- 8:00 P. M.—Theatre party, for ladies, Palace Theatre.
- 8:00 P. M.—Annual Smoker, The Association of Ice Cream Supply Men, with ice cream manufacturers as guests. Auditorium, Masonic Temple.

THURSDAY, OCTOBER 25th

- 9:00 A. M.—Session, National Association of Ice Cream Manufacturers.
- 2:00 P. M.—Session, National Association of Ice Cream Manufacturers.
- 2:15 P. M.—Matinee, for ladies. Allen Theatre.
- 8:30 P. M.—Danse Diable, for ladies and gentlemen. Ballroom, Masonic Temple.

FRIDAY, OCTOBER 26th

- 1:30 P. M.—Luncheon, followed by Modern Dance Exposition, for ladies.
- 3:30 P. M.—Inspection of exposition by ladies.
- 6:30 P. M.—Banquet and election of officers, Salesmen's Club, The Association of Ice Cream Supply Men. Hotel Winton.
- 8:30 P. M.—"Man-About-Town Evening" begins. Private entertainment parties throughout city.

SATURDAY, OCTOBER 27th

- 9:30 A. M.—Convention, The Association of Ice Cream Supply Men. Public Hall.
- 6:00 P. M.—Exposition closes.

All sessions of the National Association of Ice Cream Manufacturers will take place in the ballroom of the Hotel Cleveland.
Admission to Public Hall by registration only throughout the week.
Luncheon served daily in the Public Hall.
The exposition opens, after Monday, 9:00 A. M. daily. Closes 6:00 P. M. daily.

Quick Action Needed if Big Hotels are to House all 4,000 Downtown Hotels Have Rooms, But Cannot Hold Them Indefinitely

Ice cream manufacturers should delay no longer in making reservations of rooms for the Convention-and-Exposition.

The Cleveland Hotel, official headquarters of the National Association of Ice Cream Manufacturers, can no longer promise single rooms in any quantity for the National Industry's week. It can accommodate additional ice cream manufacturers in large, perfectly appointed double rooms.

MUST ACT PROMPTLY

The Winton Hotel can accommodate a few more guests. This hotel, official headquarters of The Association of Ice Cream Supply Men, is booked almost to capacity, however. Its rooms

all have private baths, running ice water and outside views. A considerable group of ice cream manufacturers can obtain these accommodations if they act promptly.

Very similar conditions to those obtaining in the Cleve-

Monday Great Day of Opening For Both Show and Convention

SHOW INSPECTION ALL WEEK

Entertainment to Attract Unique Publicity

The schedule of activities for the great Exposition-and-Con-
vention week has now taken al-
most final form.

Monday is the great day of
opening.

Ice cream manufacturers will
register that day on the mez-
zanine floor of the Cleveland
Hotel.

Their wives and families will
register at the same time and
at the same place; and when
they have received their creden-
tials from the National Asso-
ciation of Ice Cream Manufac-
turers they will be registered
for the week's entertainment
privileges at a nearby desk, by
The Association of Ice Cream
Supply Men.

FORMAL OPENING

At noon the mammoth Expo-
sition will open in the magnifi-
cent Public Hall.

All day Monday and every
following day throughout the
week ice cream manufacturers
from all over the United States
and Canada will register at the
entrance to the Public Hall.

CONVENTION BEGINS

Monday afternoon the con-
vention sessions proper start.
The convention program lasts
through Thursday.

All day Friday and Saturday
the Exposition will be thronged
with ice cream manufacturers
who, their convention business
over, may complete their ex-
amination of the nearly 200
separate displays of every va-
riety of product and service es-
sential to their businesses.

(Continued on Page 2, Col. 4)

Exposition Extra

Published for the promotion of the Second NATIONAL EXPOSITION for the ice cream industry to be held in Cleveland, Ohio., October 22nd to 27th, inclusive, 1923, by THE ASSOCIATION OF ICE CREAM SUPPLY MEN, 1328 Broadway, New York, N. Y., an organization of supply houses located from coast to coast, the salesmen of which houses enter every county in the United States and Canada, and all of which member houses and their sales representatives are bound by a Fair Practices Code to deal honestly with buyers. They are known by

TERMS: Have your name correct on the mailing list.

(Continued from Page 1, Col. 1)

The Show and the Convention open Monday. The Show closes Saturday. You cannot come on time and leave early, you cannot come late and stay till it is over or you cannot come early and leave early without losing something of advantage.

Be there Monday, stay till Saturday!

You won't be alone in being there. Ice cream manufacturers in every state and throughout Canada are making definite plans, their calendars before them, for leaving their businesses the latter part of the week preceding the Exposition and Convention.

They will come singly, in little groups drawn from different localities, in special cars from an entire state or section, by automobiles and by boat.

There will be lots of them there. No one need be lonesome. No one can help but learn almost incredibly from the other men he meets.

Today is only today, but October 22nd will be a different story and you should be in Cleveland then.

MORE ICE CREAM MEN URGE ATTENDANCE AT GREATEST CONVENTION-EXPOSITION

Karl B. Mory, Prof. Lockwood and P. W. Crowley Add
Names To Lengthy Roster
of Endorsements

For months representative ice cream manufacturers the country over have been publicly endorsing the great National Exposition of The Association of Ice Cream Supply Men and the 23rd Annual Convention of the National Association of Ice Cream Manufacturers. Some of the largest and most successful ice cream manufacturers have been among this number. Every section of the continent has been represented in the list.

And the list is not ended yet.

WISCONSIN SECRETARY

Karl B. Mory of Appleton, Wis., Secretary and Treasurer of the Wisconsin Association of Ice Cream Manufacturers, a large share of the membership of which is likewise included in the membership of the National Association, believes that the convention and exposition to be held in Cleveland this year "offers a wonderful opportunity to all ice cream manufacturers, both large and small, to get together and exchange ideas and viewpoints and to have laid out for their personal inspection, all under one roof, the very last word in ice cream machinery and equipment.

"To me, the opportunities of a great gathering of the representatives of one of our country's most progressive and growing industries are unlimited and only the stay-at-home will be the loser."

NEW ENGLAND ON RECORD

Prof. W. B. Lockwood, Secretary of the New England Association of Ice Cream Manufacturers, among the members of which are many of those who have been longest active in the affairs of the National Association, recently told The Association of Ice Cream Supply Men:

"The holding of the Exhibition and the National Convention of Ice Cream Manufacturers at the same time and place is of advantage to all.

"In the first place it saves time and expense of attending two conventions, in this way attracting more manufacturers to both. This is particularly the case with manufacturers whose galloneage is not large.

"In the second place both phases are necessary in the work and the getting acquainted, exchange of opinions and dis-

cussion of problems varying from manufacture and machines to policies, help all concerned and so help the industry."

And so the roster reads.

APPROVAL FROM IOWA

Added to it is the Association of Ice Cream Manufacturers of Iowa, many of whose members are among the membership of the National Association. Its Secretary, P. W. Crowley, has said recently:

"In my opinion it would be very difficult for the ice cream manufacturer to gain elsewhere in the short time which it is possible for him to gain by attending the joint convention and exposition, such as was held in Cleveland last year, as wide a range of information as can be had at the exposition mentioned. There the visitor finds modern equipment for the use of the ice cream manufacturer arranged in such manner that he can arrive at an opinion as to which type of equipment best answers his needs. It is also possible for him at an exposition of this kind to come in contact with manufacturers who have had actual experience in using the various styles of machinery and can get, if he desires, unprejudiced opinions.

"Any one who has attended one of these conventions cannot help but be impressed with the broad manner with which other manufacturers view the problems with which they are confronted and an opportunity is afforded to gather new ideas and improvements of the old ones for the promotion of the ice cream business."

Fare and a Half

When you purchase transportation ask the Agent for a Convention Certificate. It will entitle you to a half-fare return ticket.

GREATEST PR DETAILS ANN

Week's Activities Th Day

(Continued from Page 1)

No such week's events has ever been to the ice cream industry.

SELDOM MATO

Few such program been presented to the industries of the country.

Ice cream as a N industry in this week of events is to find the nation of self-expression, self-development, self-education.

The conjoined effort, national organization, two branches of the National Industry are a week's diversified activity possible.

WEEK'S ENTERTA

In addition is the social program provided by The Association of Ice Cream Supply Men, industry's representative.

The wives of ice cream manufacturers on Tuesday to taste the hospital week. The fashion, theatrical, scenic and social facilities and a of Cleveland, the first the country, will be disposal.

At the Danse D'Opéra, Masonic Temple Thursday, they, with the will be observers—sense participants—tackle that will later visioned, in all upon motion picture throughout the world.

Tuesday evening at banquet of the National Association of Ice Cream Manufacturers in the Rainbow Room, the Winton Hotel, they joy a program of entertainment that no theatre in the city has ever equalled in performance.

Visitors to the fair mobile Show in New York to the greatest pageant plays the country within the last ten years had no greater opportunity concentrated, clean, and variegated enjoyment than the ment features of the Cream Week offer.

Imperial Russian Ballet Will Contribute Stars to Program and Nation's Notable Artistic Talent Will Be Drawn on Each Day of Week for Enjoyment of 4,000 Visitors at Cleveland Entertainment Numbers that Greatest Theatres Never Assembled at One Time Will Feature Week's Events for Men and Women

One knows now that ice cream is the National Industry, the nation's best, in keeping with that status, has been entertained representatives of the industry in Cleveland. In this case means just what it says—the BEST! Among the most accomplished entertainments of the whole Exposition have been the selections of this Committee. Dancers who have been the favorites of metropolitan audiences in North America, Europe and

and evenings from Monday to Saturday of the great week.

To announce the full roster of entertainers is still impossible. Some of the most conspicuous are already under engagement for the week.

SHADURSKAYA

Next to Pavlova, whose appearances are confined to

is Shadurskaya—Lora Shadurskaya. Her partner with her at the head of her troupe of dancers is perhaps the most graceful of all the dancing men of recent years—W. Kuderoff.

Shadurskaya, Kuderoff and entire *corps de ballet* will be in Cleveland. No theatres, outside of the very largest cities of America, have ever had the op-

MODERN EXPOSITION VALUATED BY MAN OF UNUSUAL BUSINESS INFORMATION

Like an Army's State Review, and a Great University,
Combined, Says Leading Publisher,
of Show

What is the value of a modern industrial exposition—such as the Second National Exposition to be held in Cleveland?

Those closest to an institution frequently are least inclined to a thorough comprehension of its qualities and purposes. Sometimes an observer on the side lines can best appraise its true significance.

Merle Thorpe, editor and publisher of The Nation's Business, the official organ of the Chamber of Commerce of the United States, has recently commented on great modern, industrial expositions such as those promoted and managed annually by The Association of Ice Cream Supply Men, the registration at which this year in Cleveland will be 4,000.

THE DEFINITION

Writing to The Association of Ice Cream Supply Men, Mr. Thorpe has said:

"Properly conducted, a great modern industrial exposition is to the industry it represents what a State Review is to an army.

"The officers and privates of an army—the generals who plan campaigns and the men in fatigue uniforms who drive the commissary trucks—drill, work, experiment, accomplish through a year in their separate offices, cantonments, camps and posts. Each is a unit of a potent whole. Yet not until the units marshal for review is the full power and effective strength of the organization shown.

THE WHOLE GREAT PICTURE

"In the industries of America, the capitalist, the banker, the manager, the foreman, the laboratory man, the work man, the traffic man, the salesman, dream, create, experiment, persevere—accomplishing unceasingly. Great industries arise new born from their joint efforts; established industries bulk mightier; the populations of the world receive new benefits and comforts, participate in vast new wealth, in the stir and interweaving of a newer life.

"Yet not until the men from top to bottom, from testing room to shipping platform, from manager's desk to superintendent's office, can take a part in and see a full flash of—in a State Review—the industry, no matter what it is, of which they are units can they or the public they serve see the whole force, the full scope, the widening possibilities of that industry.

LIKE HUGE UNIVERSITY

"To itself and to the world an industry is visualized, as in few other ways, by a modern exposition.

"More than that, I believe a modern industrial exposition is a great practical university, and a growingly important factor in economic life.

"To buyers it is a school of commodities, processes, methods, ideas. To sellers it is a school of markets, of customers' desires and needs, of the trends and mental attitudes of the absorbing field.

IMPORTANT ECONOMIC- ALLY

"In economics it is a recrudescence, magnified, more effective, of the old trade fairs of centuries past—the time, the place and the spirit, as money is the medium, of exchange of goods on a large and wasteless scale.

"I believe that every man within an industry would benefit by visiting that industry's modern expositions."

Stars of Ballet to Help Divert Ice Cream's 4,000

Country's Greatest
Talent will be There

(Continued from Page 3, Col. 4)

prisoned, threatened with death.

Shadurskaya and her ballet will be only one of many featured acts and numbers.

LUBOVSKA

Desiree Lubovska, who received in the capitals of South America the spontaneous appellation of "The Inimitable," is another famous entertainer who will be there. She has toured the greatest cities of this country with Ruth St. Denis. For two seasons she was starred at the New York Hippodrome. She has been starred at the London Coliseum and in the greatest theatres of Europe and South America.

Shadurskaya and Lubovska represent the dance. Musical entertainment in its various forms will be no less ably represented. Vaudeville of the highest character, novelty of every sort, will be included in the entertainment offerings of the week.

Not until the Exposition opens will the full roster of entertainment be revealed.

HOTELS MUST IF YOU WANT

Reservations Must
Without Delays

(Continued from Page 3)

land and Winton Hotel, and the Hollenden Hotel and Olmstead Hotel. The latter three, just as the two, being modern, are ideally situated houses.

PRESENT SITUATION

"Cleveland can take the 4,000 expected at the exposition according to the Chamber of Commerce, but those of who have not yet made reservations are jeopardizing their opportunity to live in comfort during their stay if they delay any longer in making reservations.

"Cleveland is to be largely to Ice Cream the week of October 22, the hotels cannot be to refuse reservations from other sources out of the ice cream manufacturers have not been busy enough to make their reservations promptly.

Everything in machinery, equipment, service, supplies.

Everyone in the supply field who is contributing to the production and selling efficiency of the industry.

MANY REASONS FOR GOING.

I CAN truthfully say that the reasons for attending the National Ice Cream Manufacturers' Convention are numerous. Every convention that I have ever attended has always proven beneficial and profitable to our business.

Furthermore, I have not missed a convention in the last twelve years, and do not expect to miss any as long as I am connected with this industry.

Yours truly,

ERNEST DENK.

Seymour Ice Cream Co., Seymour, Ind.

* * *

I T IS with pleasure that I anticipate attending the National Ice Cream Manufacturer's Convention at Cleveland in October.

I have attended every convention since I became interested in the manufacture of ice cream, and which, I believe, is the duty of every ice cream manufacturer.

I always enjoy meeting the boys from all parts of America, to discuss conditions in general, and believe me, you can get a good inside track on what to expect the next season.

Yours very truly,

CHARLES TOUTOR.

Shurtleff Ice Cream Co., Janesville, Wis.

(Former president Wisconsin Ice Cream Manufacturers' Association.)

* * *

GOING TO KEEP UP WITH MODERN METHODS.

W E SHALL visit the convention this Fall.

We deem it advisable to visit same with the idea of improving our plant up to the most modern methods of ice cream manufacture and distribution, and we are sure there is a lot to learn at the ice cream show.

Thanking you for your most sincerest efforts in behalf of our trade, and with best wishes, we are,

Yours very truly,

A. BONOMO.

Coney Island, N. Y.

J. H. RANDOLPH.

General Manager-Treasurer, Imperial Ice Cream Co., Parkersburg, W. Va.

* * *

Stay-at-Home Gets In a Rut.

I EXPECT to be at the National this year. The stay-at-home gets in the rut—and you know that driving in the rut stands a poor chance of winning in the ice cream game today.

The time and money spent going to the National is a good investment.

F. R. BALLANTYNE.

Forest City, N. Y.

* * *

Georgia's President Is Going.

I AM going to attend the convention held at Atlanta for the purpose of learning just what the manufacturers are doing, and if solicited, to advise them with what I'm doing.

And if they are doing more business per capita than we are, I am anxious to find out HOW.

Yours very truly,

J. D. KINNETT.

President, Kinnett-Odom Ice Cream Co., Macon, Ga.

* * *

"Can't Afford to Miss It."

W E ARE certainly going to attend the National Ice Cream Exposition at Cleveland in October.

We think this is the greatest thing that has ever been done for the ice cream industry, and no ice cream manufacturer can afford to miss it.

Yours very truly,

ALBERT B. SIDWELL.

Manager, The Sidwell Dairy Co., Iowa City, Ia.

* * *

Goes For New Ideas.

W E ARE pleased to advise you the delegates expecting to visit the ice cream show. The delegates from this company will be A. J. Rees and R. E. Fleming.

Our reasons for attending the show are to get new ideas in merchandising, witness the performance of new equipment, renew acquaintance with friends, obtain information on the problems and abuses of the business.

Yours very truly,

R. E. FLEMING.

Manager, Fleming Ice Cream Co., Jackson, Miss.

* * *

Y ES, I expect to go to the convention at Cleveland. Why? Because it is the most profitable thing any manufacturer can do. Rubbing shoulders with the "other fellow," and the comparing of experience will result in greater knowledge of manufacturing.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

A Unanimous Declaration from Hundreds of Ice Cream Manufacturers

"Just The Thing We Need!"

MATOT

EVER-KEEP PACKAGE CREAM FREEZER

Why?

Because—

Packaged cream of any selected flavor in any size carton is instantly dispensed right from the coldest part of the freezer—no fumbling around for the flavor wanted.

The oldest cream is always dispensed first.

Zero temperature—no soft cream.

Keeps cream in hard condition in a clean sanitary package—a valuable asset for increasing the carry home trade.

Freezer accommodates packaged cream in any form—bricks, eskimo pies, cylindrical packages in quarts, pints, etc. Where necessary special size containers are made.

Cream container proper consists of a centrally located receptacle surrounded by ice on all four sides, top and bottom, and is arranged to provide individual compartments for cream of various flavors.

We guarantee these Ever-Keep Freezers if iced properly once in 24 to 36 hours to keep cream in hard condition.

Ever-Keep Freezers are carried in stock in 36 to 144 quart capacity.

We will have an interesting display of our complete line in booths 180-181 at the Cleveland Exposition, Oct. 22 to 27.

Patented Jan. 24, 1922

Member of
National Dairy Association

A full line of non-equalled ice cream cabinets, corkboard insulation, metal lined, Everlasting Redwood exteriors also tub lined carried in stock in all sizes. Stock finish is golden oak. Can be furnished in mahogany, white enameled or any other finish desired.

Write for our catalogue and net prices.

THE NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

selling problems. The result of this trade association work results in improved service to the public.

Information gained at trade association meetings cannot help but result in better production and distribution, and is a benefit to the community and tends to economic distribution with the result of lower prices and a better product to the public.

The result of the national association's work is—the best possible product with the greatest efficiency and economy. It is beneficial to all manufacturers to meet at the national convention at least once a year, and not only the executive head, but heads of departments, as far as it is possible, should attend these conventions, as it gives them a better understanding of manufacturing and selling problems.

Co-operative action, through trade association work and the review of the latest in machinery and equipment, is educational and is vitally essential to the proper conducting of business of the size and scope of our industry.

It is a pleasure to me to meet my friends at this annual gathering, and I trust that all manufacturers who can reach Cleveland will be at the coming convention.

S. T. NIVLING.

Executive Committee, National Association of
Ice Cream Manufacturers, Rochester, N. Y.

Should Go to Get Ideas.

WE believe that any manufacturer of ice cream should attend this convention, so that he may get new ideas that he can put into practice in his own plant that will save him the cost of the trip several times over, during the year.

The installation of new machinery which will cut down the cost of operation, probably would not be thought of or even considered unless a visit to the exposition was taken.

The writer knows on his own observation that attending the dairy show and ice cream exposition have been not only profitable, but have also provided a great deal of pleasure by meeting people who know more about the business than we did.

U. F. ASSELIN.

Asselin Creamery Co.,
Norway, Mich.

Valuable Information Offered.

WE think anyone interested in a production of dairy products whether it be milk, ice cream or butter, can secure more information in a few days at one of these expositions than they can secure in months of reading or through actual experience elsewhere.

You also meet people in the industry the same as yourself and in conversation and the exchange of ideas, you can always learn something beneficial for possibly someone else has had the same difficulty that you have had. You may or have been able to overcome it but find out how the other fellow has and to benefit through his experience.

All the latest and modern equipment is brought to the attention of everyone attending these expositions and many times you can find a way of handling your production in much less time and at a big saving and expense. We would also like to have a copy of the Technical Control of Dairy Products which we understand you are putting out.

D. H. MONTGOMERY,
Cairo Food Products Company,
Cairo, Ill.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

Great Benefit To All.

WE are going to this exposition feeling through the exchange of ideas by meeting manufacturers and comparing notes, there be a great benefit to all. Also that the exhibition of machinery and materials will be made in such a manner that the style and action of the machinery compared very favorably, and when the time for new equipment the ice cream manufacturer can confidently place his order for the machinery best suited to his requirements.

* * *

Always Something New.

MRS. Dame and myself have already received invitation at Hotel Cleveland. Every one in the ice cream business should go, as there is always something new coming up and we must keep up with the times.

E. H. DAME,

Delphis Ice Cream Co.,
Delphia, Pa.

* * *

Believes He Will Benefit.

WE expect to go to the ice cream convention to be held at Cleveland, Ohio. Our purpose in attending these conventions is to get new ideas and feel that we benefit by going to same. The convention last year was the best ever and we think the 1923 convention will be a greater success.

A. G. WEIGOLD,

The Torrington Creamery, Inc.,
Torrington, Conn.

* * *

Full Representation.

WE will be represented at the convention to be held in Cleveland in October, by the following: C. B. Hyatt, manager, Parkersburg, W. Va. plant; T. J. McCann, manager, Wheeling, W. Va. plant; V. D. Wells, manager, Steubenville, Ohio plant; J. R. Dickman, manager, Washington, Pa. plant; J. R. Larky, manager, Ashland, Ky. plant; B. P. Connors, manager, Huntington, W. Va. plant; H. A. Trevelyan, manager, Clarksburg, W. Va., plant; H. G. Bert, manager, Grafton, W. Va. plant; F. H. Shugart, manager, Fairmont, W. Va., plant; G. H. McDonough, manager, Cumberland, Md. plant; A. H. Warne, superintendent, Virginia Valley division, comprised of plants located at Hagerstown, Md., Brunswick, Md., Winchester, Va., Staunton, Va., and Harrisonburg, Va.; H. P. Swager, production manager and chief engineer; J. W. Strong, vice-president in charge of operations; J. W. Randolph, general manager-treasurer, in general charge of all the company's affairs.

J. H. RANDOLPH,

Imperial Ice Cream Company,
Parkersburg, W. Va.

* * *

Money Well Spent.

WE certainly believe that a manufacturer of ice cream who misses one of these conventions is missing one thing that is very necessary to be an up-to-date man in the ice cream game. We have attended three of these conventions, in fact, every one since we have been in business and have always felt that it is the best money we could spend for our business.

A Reconstituted (remade) Cream Mix

Are you preparing a mix by employing Sweet Butter,
Milk Powder, Condensed or Evaporated Milk,
Skim or Whole Milk?

We guarantee that:

IMPRUV-MIX

by its impelling and neutralizing effect will impart a
real FRESH CREAM FLAVOR.

Its name truly designates its purpose and accom-
plishment.

The Proof is in the Making and Eating thereof.

We submit the following mix, recently used by a well known manufacturer.

	Weight Pounds	Butter Fat	Milk Solids not Fat	Other Solids
84% Sweet Butter (1% S. S.).....	126.00	105.84	1.26
Skim Milk Powder (95% S.).....	106.00	100.70
10 gal. Skim Milk (.0891% S.).....	86.00	7.66
68 gal. Water (8.33 per gal.).....	567.00
Sugar (95% S.).....	140.00	133.00
Gelatine (93% S.)—5¼ lbs.....	5.25	4.88
IMPRUV-MIX (75% S.)—4¾ lbs.....	4.75	3.56
Totals.....	1035.00	105.84	109.62	141.44

Butterfat 10.21%—Milk solids, not fat, 10.59%—Other solids 13.66%. Total, 34.46%.

RESULT:—ICE CREAM, rich and pronounced in cream flavor, no milky after-taste.

WE WILL REVISE EVERY FORMULA SENT TO US.

Mr. W. P. Abel, the originator and producer of IMPRUV-
MIX, will give each his personal attention.

IMPRUV-MIX is fully as effective in a Sweet Cream Mix.

Order now. Visit us at BOOTH 97, Cleveland Exhibit.

Manufacturers' Views on Ice Cream Exposition

(Continued from page 44)

Good Clearing House.

WE have found the ice cream convention to be the best clearing house for ideas concerning the ice cream industry. These ideas are usually the result of frequent changes which are followed with others in different parts of the country. I remember distinctly a certain idea which was obtained at a previous convention which made a saving of several thousand dollars to our company in a year.

The only difference between a grave and a rut is the height of the sides. We have found it best to stay out of the ruts.

E. N. HERSHEY,
Hershey Creamery Co.,
Harrisburg, Pa.

* * *

Sure He's Going!

SURE thing! We expect to go to Cleveland, Ohio, for the National Ice Cream "Expo" and Convention. They say its to be better than last year and if that is so, one could not afford to miss it, for they sure had one big show last year.

We believe it is money well spent to attend these shows and conventions in fact we believe it pays dividends all through the next year in better and more satisfactory work.

J. C. JOSLIN, Mgr.,
Greenville Dairy Co.,
Greenville, Pa.

* * *

Create Better Understanding.

THE Hydrox Corporation will be represented at the convention of the National Association of Ice Cream Manufacturers at Cleveland in October, because we believe that a great deal of good can be accomplished at a gathering of this sort through an exchange of views on the subjects we are all naturally interested in.

Also these conventions have a certain moral influence that is beneficial and that if properly carried on should result in a better understanding and closer co-operation among manufacturers in the industry.

HYDROX CORPORATION,
(Chicago, Ill.)

* * *

Conventions Pull You Out of Ruts.

SEVERAL from this company will attend the national convention of ice cream manufacturers and the supplymen's exhibit because it helps us keep up to date and helps us out of old ruts. It is not what we know and learn of ourselves that enables us to make progress so much as that which we learn from many others interested in the same things we are. It is seldom that one individual can separate himself from others and win by self centered effort. He must learn from others and profit by their experience as well as his own.

This is the reason why we have such conventions and exhibits and why we attend them. We can not afford not to attend.

THOMAS HALL,
Russ Bros. Ice Cream Company,
Harrisburg, Pa.

Go To See "New Things."

WE attend conventions for the purpose of examining thoroughly the associated machinery, displays, crystalizing our ideas on the things which have come out, or the old things developed and to rub shoulders with others in our line of business in a constructive way.

We have never attended or sent our men to a convention for entertainment purposes, and care practically nothing at all for the entertainment, although of us always have a good time.

We will have six or eight men at the convention.

L. J. NOAKER,
The Noaker Ice Cream Co.,
Canton, Ohio

* * *

Opportunities Offered.

THIS firm will be represented at the national ice cream exposition at Cleveland in October. I cannot think of letting it go by without taking advantage of the opportunities to see the latest developments in our industry, and to meet with the other exhibitors. We look upon this as a privilege not to be passed up.

THOMAS G. HANCOCK,
T. G. Hancock Co.,
Chelsea, Mass.

* * *

Can't Afford To Miss It.

Yes, I am going. I couldn't afford to miss it.

C. F. WILLIAMS,
Manager, Williams Ice Cream Co., Westerville, Ohio

* * *

Going For General Information.

Mr. Charles T. Cushman will attend the convention at Cleveland, and his object in going is for general information, and interchange of ideas that can be to the advantage and improvement of the ice cream business.

J. H. POILLAR, Auditor,
F. H. Cushman Ice Cream Co.,
Taunton, Mass.

* * *

See, Hear And Learn.

We see, hear and learn more good, bad and indifferent, in the few days we spend at the Cleveland Exposition than the whole twelve (12) months of the year.

WE EXPECT TO BE THERE.

B. C. ACHENBACH & SONS,
Lock Haven, Pa.

* * *

Missing Much Good Information.

The writer is planning to attend the ice cream convention at Cleveland this year, having missed the three national conventions and feeling that he is missing much good information thereby.

Mighty Outpouring of Nation's Ice Cream

Manufacturers Indicated for Exposition

By LESTER S. OLSEN

NEW YORK CITY, October 10. (Special to The Ice Cream Review.)—Since mid-summer it has been apparent that the coming National Ice Cream Exposition would hold the interest of members of the industry as nothing ever has before. In fact, such a belief was easy to form at the close of the highly successful show last year.

When I left the Middle West late in the summer for a tour of the trade in the East, I knew that manufacturers throughout the western half of the country were looking forward with much eagerness to the exposition. But as time for the Cleveland pageant draws near, the growth in enthusiasm is positively amazing.

American ice cream manufacturers are waking up. In the language of the streets, they are "getting wise." Five years ago it would have been the wildest kind of an idea to think of collecting together millions of dollars worth of equipment, at a cost of hundreds of thousands of dollars, to invite manufacturers of the country to see what the supply industry had to show them.

Ice cream manufacturers who a few years ago would not think of traveling over 75 miles to attend any kind of convention now are cheerfully making reservations and getting ready for trips ranging from 500 to 1,000 miles. And even greater distances.

All Manufacturers Interested.

In visiting most of the large ice cream centers of the East, it is not surprising to find the so-called "big" manufacturers greatly interested in the exposition. The surprising thing is to note the spirit among the manufacturers who are not among the leaders in production.

Ice cream manufacturers have learned to quit saying, "Can't afford it" when progressive propositions are put before them. The spirit of the industry is best expressed by a gentleman who operates one of the New England States plants that could never be called one of the leaders. In his plant recently he told me:

"I can't afford to stay away from Cleveland. I was there last year and I don't think I can take a chance on my friends in this community going there and getting the benefit of all that educational affair and coming back here to compete with me. I can't afford to let this industry move ahead without following along. The funny part of it is, although I feel that I've just got to go to Cleveland I haven't the slightest wish to stay away."

At the headquarters of The Association of Ice Cream Supplymen officials say they expect an attendance of around 4,000, probably some over. It is easy to believe there will be 4,000 people at the exposition.

Supplymen who have visited points in the South and the South Atlantic states tell me there will be a much greater attendance from below the Ohio River than ever before. The convention spirit is rapidly developing in the South, I am told. That is to say, the national convention spirit, for although the South has been building up some good ice cream associations of its own, it

has not been largely represented at the national conventions in the past.

But observations in the East lead me to believe that this will be the most representative gathering of ice cream men in the industry's history. Special trains run from points all over this country. I noted in a recent issue of The Ice Cream Review that a special train will carry members of the California and Southwestern States Association of Ice Cream Manufacturers.

Many "Convention Specials."

Many "convention specials" will leave the Eastern states. Manufacturers of Maryland and the Cumberland Valley will ride a special from Baltimore. Pennsylvania and New Jersey manufacturers will leave Philadelphia together—that is, some of them will, with others being picked up at Pittsburgh and points out.

The New England Association will travel in a special train from Boston.

At a recent meeting of the New England Association, President Morris, of the National Association, called on his "home folks" to attend the national convention. It is not unlikely that this body will have very near 100 per cent representation at Cleveland.

The East is fairly agog over the Cleveland affair. It is the topic of the day wherever ice cream men meet. A supplyman telling a manufacturer about some goods the manufacturer should buy, may stop right in the middle of his sales talk and go to talking about Cleveland.

Never were members of the industry more interested in trade education.

The battle cry throughout the East is, "On to Cleveland!"

WEST VIRGINIANS MEET IN NOVEMBER.

The thirteenth annual convention of The Ice Cream Manufacturers' Association of West Virginia will be held November 19 and 20 at Parkersburg, W. Va. According to announcement late last month by Secretary C. J. Jamison of Huntington.

Convention headquarters will be at the Hotel Chancellor. Mr. Jamison expects West Virginia to have a usual lively, interesting, well-attended convention. The program is being drawn up and will be announced soon.

Other officers of the association are: W. M. B. Smith of Clarksburg, president; S. B. Haffner, Elkin, vice-president, and directors are: Mr. Sine, Mr. Haffner, F. Hummell of McDonald, D. P. Wickline of Mullins, H. Cline of Charleston, G. W. Sherter of Wheeling, and H. G. Bradley of Bluesfield.

If you are tired of your business, don't worry over it. Advertise it for sale in The Ice Cream Review Western Department.

WHO'S WHO IN THE NATIONAL ASSOCIATION OF ICE CREAM MANUFACTURERS

President Charles G. Morris.

IT WAS the latter part of 1906 that the "Three-I" Association of Ice Cream Manufacturers, composed of the states of Illinois, Indiana and Iowa, was re-organized and became the National Association of Ice Cream Manufacturers.

Charles G. Morris has been a member of the national association since the year of its formation. He has been serving the association as director, member of the executive committee, or president since 1912. He is just completing his second consecutive term as president.

Mr. Morris is president of his firm, the New Haven Dairy Co., New Haven, Conn. He has been engaged in the ice cream manufacturing industry for nearly twenty years. His plant is one of the most up-to-date in New England. He has taken much interest in co-operative work for the advancement of the industry, and is one of the mainstays of the New England association.

He has branch ice cream plants in eight other Connecticut towns—Hartford, Meriden, New London, Bridgeport, New Britain, Waterbury, Middletown and Norwalk.

Vice-President Morden Neilson.

Mr. Neilson, although engaged in the ice cream industry of Canada, has taken a deep interest in the affairs of the National Association of Ice Cream Manufacturers for several years. He has been a member of the association for about eighteen years. He has been engaged in the ice cream industry for thirty years. Mr. Neilson is president and general manager of the firm of William Neilson, Limited, Toronto, Canada.

Mr. Neilson is serving his second successive term as vice-president, having been re-elected with President Morris at the 1922 convention. He has been a director of the association for many years.

The William Neilson Company is one of the leading manufactories of Canada. The company supplies a wide range of territory surrounding Toronto, where Mr. Neilson's efforts have greatly developed per capita consumption.

Secretary N. Loewenstein.

N. Loewenstein has been actively identified with association work in the ice cream industry since 1906, the year of the formation of the national association. In the forepart of that year he worked in co-operation with the officers of the then "Three-I" association.

Mr. Loewenstein appeared with officials of the national organization before a commission consisting of the Department of Agriculture, the Department of Commerce, and the Department of Labor in 1906, at which time rules and regulations were being considered by the ice cream industry. Later on he appeared before the committee on definitions and standards, which committee was considering the so-called Wiley standard.

After the "Three-I" association lost its identity by the formation of the national, Mr. Loewenstein and some of the old Illinois association organized the Illinois association. He was named the first secretary, and with the exception of the years 1909-10-11, has been secretary ever since that time.

He has served as secretary of the national association since, for the past five years, and even before he was named secretary of the national, while acting in that capacity for the Illinois association, he co-operated with the officers on the standard question and other matters they had under discussion at various times.

Treasurer W. J. Weller.

Mr. Weller has been in the ice cream industry 30 years, being one of the early pioneers in New York State. He also was a pioneer in organization work, having been a member of the national association since its organization. Nine years ago he was elected treasurer of the organization, and his fitness for handling finances was well demonstrated that he has held this post ever since.

Mr. Weller is secretary-treasurer of his firm, which is located in Brooklyn.

William F. Luick, Executive Committee.

Mr. Luick has been in the ice cream manufacturing business 30 years. He was present at the formation of the national association, and since that time has been actively identified with its affairs, regularly attending conventions and committee meetings. During the years 1912 to 1916 he held, at different times, the posts of secretary and president. He was president in 1916.

Mr. Luick is president of the Luick Ice Cream Co. of Milwaukee, one of the leading ice cream concerns in the Middle West.

S. T. Nivling.

Mr. Nivling was for several years a director in the National Association of Ice Cream Manufacturers. He has been a member of the executive committee for the past three years. For the past two years he has been chairman of the cost-accounting committee.

Mr. Nivling, previous to entering into national association activities, was active in state association work in New York. He served one term as president of the New York State Association of Ice Cream Manufacturers.

Mr. Nivling is president of the Rochester Ice Cream Co., Rochester, N. Y. This company became a member of the national association in 1917, immediately after its incorporation. Previous to going into the ice cream business, Mr. Nivling spent twenty-one years in the banking business.

Edward B. Lewis.

Edward B. Lewis, member of the executive committee, can not remember when he was not a director of the national association. Mr. Lewis has been a member of the association since it started. He has been in the ice cream industry thirty years. He has been a leader in promoting the affairs of the association, and is a conscientious worker for the advancement of the ice cream industry through national organization work.

Cleveland Entertainment Details

"Miss Cleveland" will Entertain Delegates

HARRY DEAN of Cleveland, well known manager of special entertainments, has been engaged by The Association of Ice Cream Supply Men to act as manager of the various professional entertainers and entertainment acts which visitors to the Second National Exposition will enjoy in Cleveland the week of October 22-27 inclusive. Through the association Mr. Dean has transmitted to this magazine an account of some of the events and entertainers that are in store for the great week.

"The program," according to Mr. Dean," as made out by The Association of Ice Cream Supply Men is of a magnitude that has seldom been attempted in connection with any convention, anywhere in the United States. The program consists of the most elaborate plans running from the immediate arrival of the guests and delegates until Saturday night.

"The Association of Ice Cream Supply men has engaged Madam Lubovska and her troupe of three, and Shadurskaya and her troupe of six. Lubovska has appeared in one dance at the New York Hippodrome 1,500 consecutive times, a world record, and has starred in the leading cities of the world. Shadurskaya and her troupe have just returned from a year's engagement in South America and the Argentine and also in Cuba. Immediately following their engagement in Cleveland they will go to New York and be in the New York Grand Opera ballet for ten weeks, from where they will go to Cuba to play the balance of this season in Havana. I refer to these particular troupes merely that there may be realized the real effort that has been made by The Association of Ice Cream Supply men to obtain the very best entertainment possible in the United States.

"Among the entertainers, also, will be 'Miss Cleveland,' the young lady who won the beauty contest from Cleveland and entered the national contest at Atlantic City. She did not win the first prize at Atlantic City; but she won fifth prize as the most beautiful young lady in the United States, third prize as the most beautiful woman in a ballroom costume and second prize as the most beautiful girl in the middle states. 'Miss Cleveland' will appear at the banquet and on one other night.

"An orchestra composed of the soloists of the Cleve-

land Symphony Orchestra has been engaged for week.

"The attendance this year will be so large will be utterly impossible to get a hotel ballroom large enough to accommodate the crowd that will attend some of the entertainments, and the association has engaged the Masonic Auditorium. This will seat 2,000 and has a wonderful stage with all lighting effects etc.

Ladies Will Be Entertained.

"Arrangements have been made for the entertainment of the ladies. In fact, every minute of their time will be occupied in some way.

"Cleveland claims the most magnificent theatre in the world, known as Keith's Palace. The theatre cost something like \$6,000,000. Arrangements have been made with Mr. R. the manager, so ladies can attend a performance at this theatre on the night of stag party. Immediately following the performance the ladies will be shown the innermost secrets of the back stage of Keith's Palace. This is indeed a rare treat; the ladies who will go backstage will find a complete hotel within a theatre showing where the actor and actress live, his and her own dressing room, shower bath, laundry, electric wardrobe, pool room, everything to make the ladies feel at home. This will not only be of interest but it will really be of educational value.

"Arrangements being made for broadcasting of the entire program of the banquet so that the entire country within the wave length of Cleveland may be able to hear and know that there is a convention of ice cream men being held in Cleveland the week of October 22 to 27 inclusive."

Early Development of Ice Cream Industry

Means by Which the Industry Has Been Promoted in the United States
By PROF. M. MORTENSEN*

ALTHOUGH no definite information as to when ice cream was first made is available it has been known for centuries in the European countries. The general belief is that it was first made in Italy and the inventor is said to have been an Italian dairyman. It is supposed that the idea of making frozen products was brought from Italy to France by Cathrino de Medici about 1550. More definite records of the use of

ices in France date from the establishment of the Procope, about 1660, by an Italian from Palermo, Procopio Cultelli or Coltelli. Ice cream was present. The first advertisement of ice cream appeared in a New York paper, the "Post Boy" July 1786.

Although ice cream had been known for centuries in Europe the idea of commercializing it as a big industry was conceived by Jacob Fussell who started a small sale ice cream business in Baltimore in 1851; in 1854 Mr. Fussell established a similar business in Washington, D. C.; in 1862 he erected a third plant in Baltimore and in 1864 he started a business in New York City.

It will be noted from the table that the ice cream industry has spread with great rapidity throughout the entire United States until at present ice cream is sold on the tables of poor and rich alike.

Early History of Ice Cream Production in America.

State	Year when ice cream was first manufactured commercially	Name of party first introducing commercial ice cream
Penn. (**)	1880	An Italian Confectioner, Bosio, Germantown.
Maryland	1851	Jacob Fussell, Baltimore.

(**) This was a retail plant and no ice cream was sold at wholesale.

introduced into England from France. The earliest printed record of ice cream in England is found in "The Experienced English Housekeeper" by Elizabeth Raffald, published in London in 1769.

Ice cream was first sold in New York by a Mr. Hall at 75 Chatham Street, now Park Row. It was introduced to the city of Washington by Mrs. Alexander Hamilton at a dinner at which President Washington

* Instructor in Dairying, Iowa State College, Speaking before World's Dairy Congress.

Ice Cream Production For Last 14 Years.

Year	Gallons	Year	Gallons
1909	80,000,000	1916	208,388,000
1910	95,450,000	1917	219,388,000
1911	138,000,000	1918	231,058,000
1912	160,000,000	1919	248,388,000
1913	172,380,000	1920	257,828,000
1914	163,761,000	1921	216,568,000
1915	175,224,270	1922	263,528,000

When an industry develops at a tremendous rate there is usually a combination of factors responsible. This holds true with reference to the ice cream industry and the following factors may be considered as having the most direct bearing on its development:

1. The progressive and aggressive attitude of ice cream manufacturers.
2. The rapid development and improvement of machinery and equipment.
3. Trade papers and books.
4. State Agricultural Colleges.
5. State Agricultural Experiment Stations.

The Ice Cream Manufacturer.

Most of the earlier manufacturers of ice cream started with limited capital but what they lacked in money was more than compensated for by their limited confidence in the industry, and as they were located in the cities they had an opportunity to exchange ideas with men of big affairs and in that way they learned to employ big business methods.

Many of the manufacturers took less interest in financial returns than in conducting a business which would aid in creating more happiness among people in general and that spirit in connection with sound business principles is bound to win. If we visit an up-to-date ice cream factory today we find it equipped with the most modern machinery and often with bacteriological and chemical laboratories in which research is being carried on.

The ice cream manufacturer in his effort along this line of expansion has received considerable assistance from men who were not directly engaged in the ice cream business. The invention of the cornucopia ice cream cone increased the sale of ice cream materially. The ice cream cone first made its appearance at the World's Fair in St. Louis in 1904. At that time the Hazlewood Creamery Company arranged for the exclusive right to manufacture the cone at the Lewis and Clark Exposition to be held the following year in

**They Learned About
Heathzization From These**

The well known magazines whose distinctive covers are shown here, were selected to tell the story of Heathzized Ice Cream to the housewives of America during the year of 1923.

Heathzized Ice Cream is the *only* ice cream that has ever been nationally advertised.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

The First Ice Cream to Be Nationally Advertised

Telling The Story of Heathization to Millions

The Story of Heathization, like the story of Pasteurization, is a story of science brought to serve humanity through bettering a food product of universal use.

This story is now being told to the millions of readers of leading American magazines.

For the first time in the history of the ice cream industry dealers are now offered an ice cream backed by powerful and consistent advertising in magazines of national circulation.

The story of this wonderful scientific advance in ice cream manufacturing is told simply and forcefully. The appeal is convincing and effective. It is creating an unprecedented demand for Heathized Ice Cream from dealers who find that the public demands this better ice cream.

National advertising is only part of the service we render to ice cream manufacturers licensed to use the Heath Method. We furnish them with merchandising plans that are tried and true. We supply them with advertising for local use, dealer helps, sales letters, salesmen's portfolios, etc. We keep highly trained salesmen in the field constantly to assist our clients in securing new business. We gladly render to them, when necessary, expert advice in the solution of their manufacturing problems. So, an ice cream manufacturer licensed under the Heath patents gets something more than just the right to make a better ice cream.

Write for Our Plan You want to make more money. We will show you how to do it. Look into Heathization today and learn what others are doing. This is an opportunity you will grasp when you know the facts. Write us at address below.

Heathized Products Company

Wrigley Building

Chicago, Illinois

land, Oregon. Since then the cone has become known in every town in the United States. The Eskimo Pie invented by C. Nelson, Waukon, Iowa, appeared in October, 1921. This has also stimulated the demand for ice cream.

It would be unfair to close this chapter without giving due credit to the commercial travelers (The Poodle Dogs) who deal directly with the ice cream manufacturers. These men have from the beginning of the industry stood back of the ice cream manufacturers and given their encouragement and support whenever possible.

Development and Improvement of Ice Cream Machinery and Equipment.

F. D. Hutchinson, the pioneer in the ice cream business in Iowa writes, "I remember the Fourth of July of 1890 we shipped out nearly 300 gallons all frozen by hand power." Had the hand power freezer continued, little progress could have been looked for, but fortunately the old tub freezer was soon connected to a line shaft with a resulting expansion in business. A great step forward was made in 1902-03 when the Miller brine freezer was developed. This was followed soon afterward by a similar freezer known as the Miller-Tyson freezer and at present there are several makes of that type on the market.

The mechanical system of refrigeration was first successfully used for commercial enterprises in 1861 but it did not find a place in the ice cream industry until after the introduction of the brine freezer. The hardening of ice cream with brine was simultaneously introduced. This system of hardening was soon almost wholly replaced by the present dry air system which is not merely a saving in labor but also the most sanitary method of hardening known up to the present time.

The homogenizer, a machine which is essential in a modern ice cream factory, was invented by August Gaulin of Paris, France, in 1902. The United States letter patent was dated April 12, 1904. By the aid of this machine the texture of the ice cream has been greatly improved.

Other equipment which has added to the completeness of the ice cream factory is the Mojonier milk tester introduced to the trade in 1915; the Mojonier ice cream overrun tester introduced in 1917; the eighty-quart ice cream freezer was introduced by the Creamery Package Manufacturing Company in 1917; the Mojonier ice cream packaging machine appeared in 1920 and the Sealright ice cream filling machine in 1920.

Trade Papers and Books.

The Ice Cream Trade Journal made its appearance in 1905 and was followed by The Ice Cream Review in 1916. In addition to these, several journals such as the International Confectioner and some of the dairy journals have devoted space to the manufacture of ice cream. The ice cream publications have kept up to a high standard and, by presenting high ideals as well as technical knowledge, done their share in bringing about rapid progress in the ice cream industry.

In 1883 an interesting book entitled "Ice Cream and Cakes" was copyrighted by Chas. Scribners Sons, New York. The author evidently feared criticism as he signed himself "An American." It is true that he was not in possession of the scientific facts which are available today, yet he was well informed and a great deal ahead of the ice cream manufacturers of his time. Later books were published by manufacturers. These are "Ice Cream and Candy Makers' Factory Guide," by the Horizontal Freezer Company of Chicago; "The Heller's Guide for Ice Cream Makers," by B. Heller &

Co., Chicago, and "Bottlers and Ice Cream Making Handy Guide," by Warner Jenkinson Co., St. Louis.

The first college textbook giving instruction in manufacture of ice cream was "Dairy Technology," Professor C. Larson and Wm. White, published by Wiley & Sons in 1913. This was followed by a dealing exclusively with the manufacture of ice cream and ices by Professor J. H. Frandsen and E. A. Ham; it was published by the Orange Judd Company in 1915. The latest book on the subject is entitled "Book of Ice Cream" by Professor W. W. Fisk, and published by the MacMillan Company in 1919.*

The State Agricultural Colleges.

Instruction in ice cream making was offered as early as 1892 at the Pennsylvania State College. The Iowa State College was the next one to offer such instruction but not until 1901. After that the other state colleges followed in rapid succession until ice cream manufacture is today offered in thirty state colleges which give thorough and scientific instruction to from 600 to 1000 students annually. In addition many of our colleges offering short courses in ice cream making of from one to two weeks' duration and most of them are also giving some instruction in the general and more elementary courses offered to all agricultural students. It is evident that this work has been of some importance to the industry as improvements in the technique can be made only by men of a thorough technical training.

The Agricultural Experiment Stations.

Nineteen agricultural experiment stations and the Dairy Division in Washington, D. C., report that they are carrying on experimental or research work on problems related to the ice cream industry. These stations are as follows: California, Connecticut, Idaho, Illinois, Indiana, Iowa, Kansas, Maryland, Minnesota, Mississippi, Missouri, New York, Pennsylvania, Texas, Utah, Vermont, Virginia, Washington and Wisconsin.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

PIONEERS

STURDY and fearless, by their intrepid determination in the face of many hardships, the pioneers in their covered wagons opened up a new empire in the West. Today a fair and prosperous country—modern cities—progress and development are monuments to their foresight and resolute purpose.

We, too, have been pioneers in our field of endeavor. For Gumpert's Ice Cream Improver was the first step forward in producing creamier, richer ice cream with a more delicious flavor. Ice Cream is now made with a full yield, a velvety smoothness, a finer taste when Gumpert's Ice Cream Improver is used. For this modern method overcomes the faults heretofore associated with the time-for-ripening process.

Over 2,000 of the most progressive and prosperous manufacturers in the industry use Gumpert's not only because it is profitable to do so, but also because it insures better ice cream.

Gumpert's

Ice Cream Improver

Made by S. GUMPERT & CO., Bush Terminal, Brooklyn, N. Y.

It is natural that experiment station bulletins published on problems related to the ice cream industry are as yet not very numerous; it can be said, however, that we have made a good start and such publications will evidently become much more numerous in the future.

The experiment station bulletins published up to date are:

Dairy Division, U. S. Department of Agriculture.

Bulletin 303. A bacterial study of retail ice cream, 1915
Bulletin 563. The determination of bacteria in ice cream, 1917.

and other frozen products by the balance method, 1922.
Bulletin 1161. Effect of composition on the palatability of ice cream, 1923.

Reprint Journal of Agricultural Research, Vol. XXI No. 10.
Sandy crystals in ice cream; their separation and identification, 1921.

Vermont Agricultural Experiment Station.

Bulletin 155. Principles and practice of ice cream making, 1910.

Wisconsin Agricultural Experiment Station.

Bulletin 241. An ice cream overrun test, 1914.
Bulletin 262. Ice cream making, 1916.

Illinois Agricultural Experiment Station.

Circular 219. Conserving sugar in ice cream manufacture, 1918.

Circular 256. Does carbon dioxide in carbonated milk and milk products destroy bacteria, 1922

Nebraska Agricultural Experiment Station.

Bulletin 168. Sugar saving substitutes in ice cream, 1918.

Connecticut Agricultural Experiment Station.

Bulletin 83. The bacterial content of ice cream, 1915.

New York Agricultural Experiment Station.

Memoir 18. A study of bacteria in ice cream during storage, 1919.

Virginia Agricultural Experiment Station.

Tec. Bulletin 7. Smoothness and keeping qualities of ice cream as affected by solids, 1915.

Bulletin 211. Effect of binders upon the melting and hardness of ice cream, 1916.

Iowa Agricultural Experiment Station.

Bulletin 123. Classification of ice cream and related frozen products, 1911.

Bulletin 118. Lacto, 1911.

Bulletin 134. Bacteria and ice cream, 1912.

Bulletin 140. Lacto; A frozen dairy product, 1913.

Bulletin 174. Bacterial in ice cream, 1917.

Bulletin 180. Factors which influence the yield and consistency of ice cream, 1918.

Bulletin 186. A bacterial study of the method of pasteurizing and homogenizing the ice cream mix, 1919.

The Journal of Dairy Science, a publication of the American Dairy Science Association first appeared in 1917. This journal has published several articles relating to the ice cream industry; the data presented in these are usually the results of work carried on in some of the experiment stations.

Scope of Work Considered by the Experiment Stations.

The first bulletin published on ice cream making, Bulletin No. 155, Vermont Station, was naturally very general. It gave a complete discussion of the general methods of ice cream making and was based on valuable experimental data. This bulletin was so complete that it was even used as a textbook in some of the colleges. The first experimentalists naturally sought to establish some of the fundamentals. They invariably presented a score card for ice cream and a classification.

Several score cards have been suggested for ice cream but none of these were approved by the American Dairy Science Association and in 1920 that organization appointed a committee to prepare an official score card. The following score card was recommended by that committee and was adopted as the official score card, October 11, 1921:

Flavor	40
Body and texture	25
Fat and solids	10
Bacteria	20
Package	5
Total	100

It is recommended in Bulletin No. 155, Vermont ice cream be classified as first, plain ice cream, freely known as Philadelphia; second, French or Neapolitan ice cream, which differs from the former in that it contains eggs. Iowa Bulletin 123 contains the following classification:

I. Plain ice creams. II. Nut ice creams. III. Fruit creams. IV. Bisque ice creams. V. Parfaits. VI. Meringues. VII. Puddings. VIII. Aufaits. IX. Lactos. X. Sherbets. 1. Sherbets. 2. Milk sherbets. 3. Frappes. 4. Puffs. 5. Souffles.

Professor W. W. Fisk, in his textbook entitled "Book of Ice Cream," combines the two and has proposed a very sensible classification. An official classification should be adopted by the American Science Association.

Certain facts concerning the manufacture of ice cream have been reasonably well established. It has been determined without doubt that there is a definite relationship between the composition and the ability of ice cream. The conclusions reached by experiments carried out by the Dairy Division in harmony with results obtained by a commercial concern conducting experiments along similar lines should, therefore, be understood that it is not possible to make a real palatable ice cream unless it is made from cream. Ice cream has been standardized reasonably well and contains usually from 20 to 22 per cent milk solids. The sugar is somewhat more variable, ranging from 12 to 16 per cent in different brands of ice cream.

Body and texture defects of ice cream have been studied and to some extent solved. It has been definitely proven that sandiness in ice cream is due to the crystallization of lactose from a supersaturated solution. It has been found that there is a somewhat definite relationship between the temperature at which the cream is drawn from the freezer and the texture of the resulting product. The time required for freezing bears a similar relationship to the texture of the yield.

By increasing the viscosity of the mix, especially by the addition of binders and by homogenization, air can be worked into the ice cream in a finer division. Therefore, the mix becomes more finely divided and the ice crystals in the finished product decreased in size correspondingly. The body of the ice cream also becomes firmer and stronger as the air sure within the air cell increases with the decrease in the size of the cell.

In the unpublished work done at the Iowa Station, it has been found that the greatest factor responsible for the increase in viscosity of homogenization is the clumping together of the globules. As the pressure of the homogenization increased the fat clumps increase in size and then somewhat corresponding increase in viscosity. It has been found that if an ice cream mix homogenized at high pressure is stirred or agitated the clumps of globules are reduced in size and this is accomplished by a corresponding decrease in viscosity.

The data that have been secured on the bacterial counts of ice cream show that this product frequently contains excessive numbers of bacteria but that by using sterilized raw materials and careful methods the counts can be

kept low and will remain low during proper storage. The investigational work at present being done deals mainly with the question of the sanitary quality of the product. Bacterial standards are in force in a few cities and will undoubtedly be much more common in the near future.

With the establishment of such standards the factors influencing the bacterial count become of a great deal of importance; chief among these are, the quality of the raw materials used, the pasteurization of the cream or mix, the storage of the cream or mix, methods of cleaning equipment, and the holding of ice cream.

the man possessing the necessary qualifications to develop that phase of our dairy research. The bacteriology of ice cream is comparatively simple and involves the keeping out of microorganisms as far as possible and the destruction or prevention of growth of those that do gain entrance.

The ice cream industry offers great opportunities for future research, but the person choosing that field should be well trained, especially in physical chemistry. The field for the bacteriologist and dairy chemist is somewhat limited; most of the future problems will be physical and there should be a wonderful opportunity

Power Consumption During Freezing Process

By F. B. FULMER*

IN order to ascertain the variations of the power demanded during the period that a charge of ice cream mix is in an ice cream freezer, and also to find the maximum power required during the freezing process, a set of electrical instruments were attached to the wires supplying current to the motor on a direct-connected, chain-driven, forty-quart ice cream freezer.

The freezer chosen for the test was in perfect mechanical condition, insofar as freedom of moving parts was concerned. The mix came to the machine at a temperature of 39 degrees F., and the amount used

The friction load for the clean freezer, at the start was only about sixty per cent of what the friction load was after the freezer had been used and all ice cream drawn out that it was practiceable to obtain. This was to a large extent, caused by the small amount of ice cream that adhered to the walls of the freezer, which acted as a retardant to the action of the scraper blades. Some slight influence might have been caused by the freezer being colder after the first admission of brine.

All of the electrical readings obtained have been converted into the nearest convenient fraction of

was exactly twenty quarts each time and the amount of finished product recovered was forty quarts in each test, except the first freezing, which was thirty-nine and three-eighths quarts.

The temperature of the freezing brine was maintained within one degree of zero: The mix contained eleven and one-half per cent butterfat and thirty-six per cent total solids. All operating conditions were kept as near uniform as was possible with practical manufacturing.

The first freezing required one and three-fourths minutes longer than subsequent ones, hence none of the figures for that one are included in the chart or the table.

freezing, all the readings for any particular period of the freezing process were surprisingly close; in fact, at no time did there appear to be a variation as great as seven per cent.

Readings were taken every thirty seconds, but the tabulated results are given for even minutes only, this gives close enough records for practical results.

A study of the results obtained demonstrates that there is a wide variation between the law power of horse power. The table and chart are the composite results from the various tests, but aside from the findings at the start and the peak load just before drawing the finished product. The freezer used for the experiment was fitted with a 3 H. P. motor and it was observed that it was over forty-four per cent overloaded at the completion of the freezing process. Had this freezer been equipped with a 2 H. P. motor (some freezers of this size have been in the past) would have been over 100 per cent overloaded.

The duration of the overload for the 3 H. P. motor was relatively so slow that no material harm would result, but it emphasizes the fact that freezers should be in as perfect condition as possible, for with an undue friction load it builds up the overload very rapidly

the end of the freezing period and causes an economical loss during the whole time that it is being used.

It also demonstrates that the occasional practice of overloading a freezer, i. e., using twenty four quarts of mix in a forty quart machine—not only has a tendency to strain the moving parts, but it will greatly augment the overload on the motor to the danger point.

Table showing load on a 3 H. P. motor direct connected to a 40 quart ice cream freezer.

Friction load, clean machine.....	2/9
Friction load, used machine after ice cream was drawn	2/5
End first minute	3/5
End second minute	2/3
End third minute	3/4
End fourth minute	1
End fifth minute	1 1/3
End of sixth minute	1 2/3
End seventh minute	1 8/9
End eighth minute	2 1/9
End ninth minute	2 1/3
End tenth minute	2 2/3
End Eleventh minute	3 1/4
End twelfth minute	3 1/2
End thirteenth minute	3 8/9
End fourteenth minute	4 1/3

At this point ice cream was ready to draw from machine and power consumption fell very rapidly.

NEW ENGLANDERS TO ATTEND EXPOSITION IN BODY.

Preparations to attend the National Ice Cream Exposition in a body were made at the monthly meeting of the New England Association of Ice Cream Manufacturers at Boston, September 19. Secretary Lockwood took up the matter of train reservations.

Charles G. Morris, president of the national associa-

tion, told the members that he would be deeply fied to see his "home association" well represented in Cleveland. He extended his personal invitation to member.

The next meeting of the association will be in November, the October meeting being cancelled on account of the exposition.

Winter specialties comprised a subject of interest at the September meeting. Many manufacturers said they would continue manufacturing chocolate coated ice cream bars. Others were undecided.

The association launched a campaign for twenty new members before the next meeting. There are now 75 manufacturers in the association at this time. It was recognized that many more New Englanders should be members.

Mr. Wells of the Cone Company of America took part in a discussion against newspaper publicity detrimental to the industry such as that given in a newspaper article, produced at the meeting, which condemned old, insanitary conditions.

MANUFACTURER'S VIEWS ON EXPOSITION

(Continued from page 48)

Going Full Force.

We expect to attend in full force—not only the officers of the company, but the department heads. We have proved by experience that the knowledge gained at these conventions is of such value to the department heads, that we cannot afford to miss it.

J. H. CAPAS,

Cleveland Public Hall

Ice Cream Exposition to be Held in One of Most Magnificent Exhibition Buildings in the World

THE Public Hall, Lakeside Avenue at East 6th St., erected by the City of Cleveland at a cost of \$6,300,000, is regarded as one of the finest and most modern buildings of its kind in the world. It is ideally located in the heart of the downtown section and within easy walking distance of all the principal hotels, public and office buildings and the retail and wholesale shopping districts.

The building is designed in the Italian Renaissance style of architecture and is of modern fireproof steel construction. The interior is faced with marble, tile and decorative plaster. Care has been taken to make the latter pleasing and acceptable to the eye. Battleship gray is the predominating color. Scrolls and art work in pale blue adorns the balustrade which borders the bal-

conies, food and farm products, building materials, textile products, plumbing and heating and the like be shown to advantage and without expensive installation requirements. Its close proximity to railway freight depots also proves advantageous. Exhibits are involved.

The main auditorium in the Public Hall has a seating capacity of 11,500, approximately 6,000 being on the main floor and 5,500 stationary seats on the balconies. The auditorium is artificially illuminated by a flood of soft light diffused through a field of panels in the ceiling. Every convenience attending large gatherings is provided, including numerous committee rooms for conference.

A pipe organ said to be one of the finest in the

conies. The arch over the stage is decorated with gold work and colors which harmonize. The color scheme gives the interior a softness and warmth unusual in auditoriums and halls of such magnitude. The design and architectural effect of the exterior harmonize with the County Court House, City Hall and Federal building already erected and forming a part of Cleveland's famous group plan of public buildings.

The building is unusually suitable for all manner of conventions, entertainments, balls, carnivals, circuses, plays and pageants, musicals and grand opera. Spacious stairways and ramps give free passage from floor to floor and the entire building may be emptied in a remarkably short time.

Exhibitions of aeronautics, animals, automobiles, ma-

States and the most perfect in the country in the matter of variety and scope of tone has been installed. It has 10,010 pipes, 150 direct speaking stops and costs \$100,000. The console is mounted on an elevator so that it may be lowered below the arena floor when needed. The echo organ is located in the rear of the auditorium, three hundred feet distant from the console.

Mammoth Stage.

The stage is one of the largest in the country, being 104 feet wide and 56 feet in depth. It has an open rear 72 feet in width surmounted by a high arch. The stage may also be used as a convention room, seating more than 1,000 persons. Included in the stage equipment are two passenger elevators and a lift. Also, conven-

THE ALLEN CANDY COMPANY
 PONTIAC, Manufacturers ILLINOIS

is provided for exhibitions, etc., thus a total approximating 67,000 square feet is conveniently available upon the auditorium and exhibition hall floor levels.

Numerous ramps and stairways for visitors provide ready circulation between exhibition and auditorium floors and the streets. Suitable doorways and ramps of easy grade admit of large or heavy exhibits being transported safely and expeditiously to the two exhibit floors.

On the second floor are several conference or committee rooms having natural as well as artificial light; locker rooms which may be used for storage purposes; and the general offices of the building.

Entrance to the upper and lower balconies is from the third floor where also are conveniently located numerous check rooms and lockers.

Provision has been made for telephone booths, taxi cab offices, ladies' and gentlemen's retiring rooms, shower baths, lockers, check rooms, telegraph stations, a barber shop and many other conveniences for guests. The most modern of ventilating and sanitary systems are used and its appointments in this respect are complete in every detail.

Exhibition Features.

The exhibition features of Cleveland's new Public Hall have been pronounced by several exhibit managers to be unusually complete and serviceable. Other halls may have greater floor area, but for size, location of building and serviceableness it is without a peer. Prominent among its advantages are the special exhibit services, at convenient points such as connections for electricity, gas, steam, compressed air, vacuum, hot and cold water, drainage for waste water, etc.

Location.

The location of the new building is doubly advantageous in that it affords an unobstructed view of the harbor and of Lake Erie, and is also within easy walking distance of principal hotels, theatres, retail and wholesale districts, and the Union Passenger Station. Railway freight terminals are conveniently at hand. Thus admitting of maximum dispatch and minimum expense in transferring exhibits to and from the building.

Exhibit Area.

The building provides upwards of 70,000 square feet of floor space for exhibits. Of this some 65,000 square feet are conveniently available and unusually attractive. This space is upon two floors—the "Arena" being the main floor of the auditorium (street level) and the "Exhibition Hall," the latter being in the basement.

Arena Floor Area.

The Arena floor is 247 feet long by 120 feet wide, and contains 29,640 square feet of clear floor space. The stage overlooking the arena, and about 3 feet 2 inches higher, may be used for exhibits or for convention sessions. It is 56x104 feet, and has an opening 72 feet wide surmounted by an arch 42 feet 6 inches high.

Exhibition Hall Area.

The Exhibition Hall is 225 feet long by 121 feet 6 inches wide, and contains 28,533 square feet, broken only by 40 building columns each 28x20 inches. These columns are spaced 23 feet centers north and south, and 21 feet 6 inches centers east and west. Outside rows of columns are 28 feet 6 inches from the east and west walls. A very attractive feature of the Exhibition Hall is that the ceiling has 16 feet clearances above the floor.

Adjoining Exhibition Hall at the south are rooms each 50x23 feet. These may be used for displays or as conference rooms, and in latter event will accommodate approximately 165 people. Other spaces which could be used for displays are available. These floors should it be necessary to have a total of 65,000 or 68,000 square feet for exhibits.

Exhibit Services.

At each building column in exhibition hall is an ice station. At each of these service stations connections may be had for any two of three types of electric current for power or decorative purposes. At many of these stations connections may also be made to secure hot and cold water, compressed air, gas, high pressure steam, vacuum, vacuum cleaner and drainage for waste water.

Upon the arena floor similar services may be obtained from stations located at side walls, and from cabinets located in a row of pockets running about the edge of the floor east and west.

Circulation.

Unusual provision has been made for free circulation by pedestrians between the arena floor and exhibition hall, thus rendering the building particularly attractive for an exhibit requiring both floor areas.

Electric Current.

Electric current available in the building for all purposes is approximately 1,500 kws., 500 kws. being direct current, and 1,000 kws. alternating current.

Illumination.

The arena and the auditorium are illuminated by direct method. Approximately 1075 lamps of 200 watts each, are located behind a field of glass panels in ceiling 80 feet above the floor of the arena, and diffuse a flood of soft light to the arena below. For exhibition it is intended, at some future time, to suspend lamps from the ceiling thus bringing the lamps closer to the exhibits. Additional illumination is supplied for floor area under the lower balconies.

The exhibition hall is adequately illuminated by direct lighting by means of lamps placed in the ceiling of the bays formed by the building columns.

Exhibition Entrance.

The main entrance for exhibits for exhibition and for the arena is at the northeast corner of the building from which point leads two ramps, one with a grade to the exhibition hall below, and the other to the arena floor. Exhibits may also be taken into exhibition hall by way of a ramp and skids at the north end of the building.

Flooring.

The floor of exhibition hall is granolithic asphalt upon a concrete foundation. Strength—600 pounds per square foot excepting the space lying within 10 feet of each side wall, which space carries 125 pounds per square foot.

Floor of the arena is wood embedded in mastic upon concrete foundation. Strength—250 pounds per square foot.

Toilets

Adequate toilet facilities will be found at convenient points upon the exhibition hall level, as also upon the second floor.

space No. 125. Arrange
to inspect our plant while
at the Exposition.

Clean Up and Paint Up

These two slogans of the paint trade are particularly
applicable to the Ice Cream Industry. Use

selecting bright, attention compelling colors for tubs and cans.
Paint your personality on each container, that each one may
arrest the attention of the passerby and unconsciously impress
him with the quality of your product and the cleanliness of
your plant.

There's a DERYCOTE for interior walls and ceilings, as well
as one for trucks, wagons and delivery equipment. There are
DERYCOTE varnishes and stains for cabinets, and DERYCOTE
stencil pastes for tubs.

All are made to meet the peculiar requirements of Ice Cream
Manufacturers.

Send for color card. New and lower prices are now in effect.

THE NATIONAL PAINT & VARNISH CO.
CLEVELAND, OHIO, U. S. A.

Committee Rooms.

A total of 16 rooms in the building may be used as committee rooms—of these 10 are easy to access and range in capacity from 50 to 170 people.

General Meeting Room.

The stage is especially prepared to accommodate general meetings and will seat approximately 950 to 1,000 persons.

Storage For Crateage.

Considerable space for storage of exhibitors' crateage is available in the building. The architect estimates it at some 12,400 square feet. Additional space is available upon land adjoining the building should the building's facilities be over taxed.

Also to be installed in the building are facilities for telegraph offices, 28 telephone booths, barber shop, baths, circulating ice water, numerous check rooms and other features to render the building complete in every particular.

The measurements and other particulars given herein were abstracted from drawings of the building, blue prints, etc., in the city architect's office during March, 1921. It is barely possible some minor changes may have been found necessary in the actual completion of the work. It is not possible, therefore, to guarantee the data until after completion of the building and opportunity afforded to verify same through actual inspection, measurement, etc.

DOING ONE THING—WELL.

Editor The Ice Cream Review:

Ice cream manufacturers are realizing the necessity of revamping their plants in order to secure the economic results of direct routing and dispatch in handling their products.

Sales are dependent on two factors—quality and price. These facts govern the volume of any product and ice cream follows the natural economic law just as closely as any other commodity. Profits in the larger sense, are secured by "mass" rather than "class" production and low operating costs are the foundation of low selling price and volume production.

The industry is rapidly reaching the stage which demands a careful engineering analysis of every operating machine in the plant. An example of this is demonstrated by the increase in freezer capacity by a careful co-ordination of brine supply and temperature for each machine. Many other items of equipment should have the same careful consideration.

Work of this character requires sound engineering training in addition to experience with ice cream production. The materials entering into the construction of the various departments also present an engineering problem which call for experience with the wearing qualities of the products on the market.

Co-ordination and proper balance of the various items of equipment are a problem of no mean proportions.

Correct routing details are best developed by those familiar with many plants, accustomed to development in scale and plan and not restricted by utilizing some particular apparatus, which may or may not be suitable for the particular plant.

New plants usually work out to best advantage from the operating standpoint, but at times old plants can be remodeled into very efficient arrangement of departments and direct routing of materials.

Man's service to society (and usually his profit) is

measured by doing one thing well. If he is doing he is usually kept busy. If he is manufacturing selling ice cream, therein lie his service and profit. A tailor will supply him with a more efficient suit of clothes than he could design and make for himself. The dairy specialist will provide him with a more efficient and attractive plant than he could possibly do without that service.

There are forms and conditions to cover and to be attained in each case and certain results to be attained. This can be accomplished by the man who does One Thing Well.

WILLIAM H. TIMM,
Philadelphia, Pa.

ICE CREAM CONE MAY REPLACE HOT TAMALE IN ARGENTINE, SAY FOREIGN DELEGATES TO EXPOSITION.

News reaching The Ice Cream Review from Buenos Aires indicates that the ice cream cone may supplant the tamale in the Argentine. Four Argentines in this country to attend the World's Dairy Congress and the International Ice Cream Exposition state this. They will visit the Cleveland exposition with especial interest, for though the ice cream industry is barely started in Argentine, these delegates believe it has possibilities there.

The men are Arturo Pimentel, secretary to the minister of agriculture; H. Gustave Casares and Ricardo M. Pearson of Buenos Aires, and Ernesto M. Quirós of Rosario state.

Their tour of ice cream plants kept them in Buenos Aires three days. A. G. Hoefler, president of the Hoefler Cream Co.; W. C. Stephens, vice-president of Rice Adams, and H. M. Cary, president of the Queen Milk Co., took the strangers in charge at Buffalo.

"The ice cream industry in South America is in its infancy," said Signor Pearson. "We want to get some notions about how to manufacture it and how to advertise it from the Americans. We have always had a meat industry there, but dairy products never amounted to much until after the war. Since then we have been exporting much cheese, butter and casein. But the ice cream cone is unknown in South America. We have sherbets, but no cones. Of course, we will have to modify it for Argentinian use."

BOEHM JOINS THOMPSON-BREMER CO.

E. G. Boehm of Chicago formerly sales representative for the John Wood Manufacturing Co. in Illinois, Indiana and Southern Wisconsin, has recently severed his connections with that company to become a member of Thompson Bremer & Co., of Chicago, and will be in charge of the sales department.

Thompson Bremer & Co., are jobbers of milk and cream cans, bottle cases, etc., and are also engaged in the re-tinning of cans.

GLACIFER COMPANY WINS.

The Interstate Commerce Commission some time ago reopened the case of the Glacifer Company vs. American Railway Express Company upon petition of the defendant. The original order by the commission directed the express company to bill shipments of ice cream in dry containers at approximately 75 per cent of the gross actual weight. The findings in the original case have been affirmed and are being complied with by the express company.

THE NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

An Electrically Operated Ice Cream Plant

ABOUT thirteen years ago Ernest L. Haines conducted a general store in Lynn, Mass. Mr. Haines, being a typical American citizen, liked to eat ice cream. Almost every evening just before closing time he would slip across the street and purchase some for his own consumption. Shortly his taste became so keen that the quality of the commercial product did not satisfy him, so he purchased a small freezer and began to make his own ice cream. Naturally he had a surplus supply which his friends and customers helped him to consume. The idea of quality ice cream became fixed in his mind and soon the demand for his personal ice cream increased. He enlarged his

General Electric Type KT-711—4 Pole—1 HP—1800 RPM—60 Cycle—550 Volt Motor with CR-1038 Starter Operating "Mojonnier" Carton Filling Machine, Capacity 1200 Quart Bricks Per Hour, in Plant of Ernest L. Haines, Inc., Lynn, Mass.

operations and went into the ice cream business in earnest.

Today, E. L. Haines, Inc., occupy a model establishment, which is one of the most interesting examples of a completely electrified ice cream plant. It is equipped with 70 H.P., in General Electric type motors driving a battery of four forty-quart freezers, an ingenious brick filling machine which can do more work in a day than one man could accomplish in six weeks by the old hand methods, a carton lining machine, 3 storage and mixing vats, a 500-gallon pasteurizer and mixer, a homogenizer, and ice cream breaker, a conveyor used in filling the delivery trucks with ice, and all of the refrigerating apparatus. This latter is driven by a 40 H.P., GE variable speed induction motor, taking care of mixing, freezing, and the hardening room which contains over a mile of piping, the temperature being kept at a temperature of from 2 degrees to 18 degrees below zero.

Motors also operate the pumps which transfer the cream from a liquid state, through the several manu-

General Electric Type KT-160—4 Pole—1 HP—1800 RPM Cycles—3 Phase—550 Volt Motor Driving a 500 Gallon Pasteurizer and Mixer; Also a General Electric Type KT-312—6 Pole—20 HP—1200 RPM 60 Cycles—3 Phase—550 Volt Motor Driving Manton-Gaulin Homogenizer in Plant of Ernest L. Haines, Inc., Lynn, Mass.

facturing processes, until it is ready to leave the freezer and be placed in the hardening room. Mr. Haines believes that by these methods waste and labor expenses are kept at a maximum and that better ice cream is made in a better way, cleanliness being everywhere paramount.

"Our plant," says Mr. Haines, "is 100 per cent electrical and yet the operating cost for electric light and power amounts to only \$0.0181 per gallon of ice cream produced. The ratio of our power cost is steadily decreasing as our production is increasing and the figures most certainly warrant any ice cream plant using electric power."

"Cleanliness, dependability, and ease of operation are the chief power requisites in our industry," he added. "Then, naturally, the cost must be considered. I use individual electric drive on all of my apparatus. The motors are readily installed, occupy little space, are easily kept clean, run, and keep running with little attention except lubrication—anyone can operate them and no expert skilled is required for maintenance."

Battery of Four 60 Quart Ice Cream Freezers, Each Driven by a General Electric Type KT-160—6 Pole—3 HP—1200 RPM—60 Cycle—550 Volt Motor in Plant of Ernest L. Haines, Inc., Lynn, Mass.

THE NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

PROFESSOR BAER'S INQUIRY DEPARTMENT

Answers to Inquiries

Dear Sir:—Please advise whether ice cream colored with certified coloring will change color after staying in a room where the temperature varies. Sat at one time the room is five below zero and then again will be ten above. Will this affect the color of the cream in any way?

A. J. W.

Reply: I can see no reason why the color of ice cream should change with variations of temperature in the hardening room. You will find, however, that the color will appear to be stronger and more distinct when the ice cream is first made. Practically all colors will fade somewhat when cream is in storage several days. Variations in temperature should have nothing to do with the color.

* * *

Dear Sir:—We are having trouble keeping our cream hard in our various dealers' cabinets and are wondering if the trouble lies with our mix? The mix we are at present using consists of the following:

- 182.5 lbs. sweet butter, 92.0% butterfat.
- 28.75 lbs. skim milk powder.
- 17.5 lbs. gelatine.
- 560.0 lbs. sugar.
- 186.0 gallons whole milk, 3.5% butterfat.
- 89.0 gallons evaporated milk, 5.0% butterfat.
- 16.25 gallons evaporated milk, 7.5% butterfat.

Normally from this size mix we obtain 640-650 gallons of ice cream which, in plain flavors, we believe would analyze about 12 per cent butterfat. We use a 24 hour natural ageing in a Cherry holding vat at 40 degrees F. after a careful pasteurization and viscolizing at 2500 pounds pressure.

We freeze with 0 to 5 degree brine in about ten minutes and whip for five minutes, giving us about four freezes an hour. Our freezer is a Cherry 50 quart direct drive and seems to give us a smooth even product.

Could it be that the sugar content of our mix is too high for a commercial cream? What could we do to prevent a "powdery taste" which we find present at times? What effect does high hardening room temperatures have on the ability to keep cream hard with a twenty-four hour "icing service?"

J. C. CO.

Reply: I have analyzed your mix and you will find the calculations given below in table one:

Table 1.

Ingredients	Fat	Serum Sol.	Total Sol.
182.50 lbs. butter, 92% fat..	167.90	167.90
28.75 lbs. skim milk powder.		27.3	27.30
17.50 lbs. gelatine.....		16.60
560.00 lbs. sugar.....		532.00
1581.00 lbs. 3.5% milk.....	55.33	135.8	191.10
801.00 lbs. evap. milk, 5%..	40.05	128.2	168.20
145.25 lbs. evap. milk, 7.5%.	10.96	26.3	37.30
3317.00 lbs.	274.24	317.6	1140.40
Per cent	8.2	9.6	34.38
Per cent sugar.....	16.88		

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

There are two things relative to your mix that not quite understand; one of them being your butter containing 92 per cent butterfat. Usually butterfat content of sweet butter is not over 85 per

The other point I have in mind is the 5 per cent butterfat content of your evaporated milk. You also to believe that your mix would analyze 12 per cent butterfat when my figures would show that it only contains a little over 87 per cent. You will also notice that the sugar content of your mix being 16.88 per cent is high, 14 per cent should be plenty high enough. However, if you were to reduce the sugar content to 14 per cent you would have to increase the milk solids in to keep your total solids about 35 per cent. I do not know just why you would use such large amount of evaporated milk unless you have difficulty in getting skim milk powder.

The powdery taste which you state you have occasionally in your cream, cannot come from your milk powder unless this is an old insoluble powder. It does not appear from the description in your letter that the trouble you seem to have is due to any point in the processing of your mix. It also appears that the icing of your mix is carried out properly. The hardening room should be kept at as low a temperature as possible and should not be permitted to go higher than 10 degrees above zero. In fact it would be better to keep it at about zero. Then if your cream is properly packed out and kept hard until it reaches the retailer, he should not have any difficulty in keeping it hard at the fountain providing the icing service is correct at the fountain.

* * *

The high sugar content of your cream is partly responsible for some difficulty in keeping the cream hard.

Dear Sir:—In our mix now we use all sweet cream making a 10 per cent butterfat, 11 per cent serum solids, 14 per cent sugar and 34 per cent total solids but our total solids up with skim milk powder and gelatine per cent overrun with a Emory Thompson vertical freezer. Our sweet cream costs us 50c per pound butterfat. We also churn and during the hot weather have used sweet butter, using a small emulser.

We were thinking of installing a viscolizer and using our sweet butter altogether, as there would be a savings in the price of sweet cream and sweet butter churned in our own creamery. With the proper equipment would sweet butter make as good a quality of cream as sweet cream?

On a business of 20,000 gallons a year would you advise making this change, and can we get a 100 per cent overrun with a vertical freezer? We are thinking of re-placing our vertical freezer with a horizontal freezer.

M. C.

Reply: I notice that you are now making your cream practically entirely from sweet cream. I would

Red Seal "Homo" Powder

Improves Ice Cream. It helps the Homogenizer by increasing the viscosity of the mix, assists in breaking up the milk fat globules and retains them in a fine and evenly distributed condition. Homo-Powder retains its jelling capacity at the homogenizing temperature, a property not possessed by gelatine. Use Homo Powder and be convinced. Get our 1924 prices for "Homo" in lots from 1 to 10 tons. The cost is trifling compared with the distinct improvement that results.

Red Seal Ripener

Positive results. Ripens and thickens the batch by enzymic action. Required viscosity can be produced quickly or moderately slowly by regulation of amount of Ripener used. Do not let your batch stand too long in the old way without ripener, if you want to produce ice cream with a low bacterial count.

Red Seal Vanillas

All grades from best bean extracts to low priced imitations. You will save money and obtain satisfaction by contracting now. Contracts accepted for lots from 1 to 50 barrels for 1924 delivery.

Red Seal Certified Colors

Manufactured in St. Louis by the Warner-Jenkinson Company. All shades. Strong, pure, brilliant. Supplied in Powder, Paste or Liquid.

Red Seal American Cheese Color

Vegetable. Extra strong. Gives a true cream color to the mix.

Red Seal Extracts

Highest grade for ice cream flavoring.

Red Seal Milk of Orange

Ideal for water ices and sherbets.

Warner Jenkinson Co.
St. Louis

suggest that you continue to use all the sweet cream possible, even for next season, and then use sweet butter to supplement any shortage of fat.

If you churn your own sweet butter and can depend on an absolutely fresh supply all the time, you will not note as much difference in the quality of the ice cream. However, if you could use about one-third sweet cream and two-thirds butter for the fat, I am sure you would improve the quality of the cream.

I believe it will pay you to install a viscolizer even on that basis. I also believe you will get better results if you will put in a horizontal freezer to replace the vertical machine which you now have.

* * *

Dear Sir:—We are trying to make an ice cream containing the following ingredients:

92 score ABC butter.

Spray process skim milk powder.

Whole milk of butterfat content between 3 and 4%.

Evaporated milk (whole) butterfat 7.5%.

Evaporated milk (part whole and part skim) butterfat 5%. With an ultimate analysis on the mix of 10 to 12 per cent butterfat, 35 per cent total solids, and a sugar content of not to exceed 14 per cent. We are endeavoring to do this, believing that this should give a cream of exceptional goodness. We would be glad to receive from you your suggestions as to a formula to use containing these or other suitable ingredients.

Reply: I am suggesting below in tables 1, 2 and 3 three mixes containing the ingredients suggested in your letter, balanced up according to your suggestions:

Table 1.

100 lb. mix, without skim powder.			
Ingredients	Fat	Serum Sol.	Total Sol.
14.0 lbs. sugar.....	13.30
.5 lbs. gelatine.....47
20.0 lbs. 5% evaporated.....	1.00	3.60	4.60
10.0 lbs. 7.5% evaporated.....	.75	1.80	2.55
10.3 lbs. 84% butter.....	8.65	8.65
45.2 lbs. 3.5% milk.....	1.58	3.88	5.46
100.0 lb.	11.98	9.28	35.03

Table 2.

100 lb. Mix.			
14.0 lbs. sugar.....	13.30
.5 lbs. gelatine.....47
10.0 lbs. 5% evaporated.....	.50	1.8	2.30
10.0 lbs. 7.5% evaporated.....	.75	1.8	2.55
1.7 lbs. skim milk powder.....	1.6	1.60
10.0 lbs. butter, 84%.....	8.40	8.40
53.8 lbs. 3.5% milk.....	1.88	4.63	6.51
100.0 lbs.	11.53	9.83	35.13

Table 3.

100 lb. Mix.			
14.0 lbs. sugar.....	13.30
.5 lbs. gelatine.....47
8.0 lbs. 5% evaporated.....	.40	1.44	1.84
8.0 lbs. 7.5% evaporated.....	.60	1.44	2.04
2.4 lbs. skim powder.....	2.30	2.30
11.0 lbs. 84% butter.....	9.24	9.24
56.1 lbs. 3.5% milk.....	1.96	4.71	6.67
100.0 lbs.	12.20	9.89	35.86

I am sure that either one or all three of these mixes should give you satisfactory results.

Lest You Forget!—The 23rd annual meeting of the National Association of Ice Cream Manufacturers will be held in connection with the second national exposition of The Association of Ice Cream Supply Men at Cleveland, October 22-27 inclusive.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

SPOKANE ICE CREAM MEN WIN RATE

Agreement between the Spokane ice cream manufacturers and distributors and the American Express Company regarding ice cream rates Portland and Spokane to eastern Oregon points reached the middle of September at a hearing in the federal building before Examiner Mackley of the state commerce commission. It is expected the differences will be officially adjusted in a mutually satisfactory manner by the commission on the basis of recommendations of the examiner.

The complainants were represented by the Spokane Merchants Association through C. O. Bergan, manager, and F. N. Martin, general manager of the Hazelwood Company. They were the only Spokane witnesses.

They presented tables and other documentary evidence demonstrating that the defendant company permitting a discrimination against Spokane shippers in ice cream shipments to the eastern Oregon points in favor of Portland shippers. This discrimination, pointed out, has two phases.

Spokane shippers pay express on an estimated weight of 115 pounds on a five-pound freezer, Portland shippers pay on a weight of 100 pounds on the same freezer to the same points. The actual discrimination against Spokane, according to the local witnesses, runs from 58 to 83 cents on a five-gallon freezer of ice cream, averaging about 12½ cents a gallon.

It was not contended that the Spokane rate was high, but that the Portland rate is too low. The Spokane scale is on the basis worked out nationally approved by the interstate commerce commission.

The chief witnesses for the American Railway Express Company were L. A. Lockwood, general manager, San Francisco; Edward Stern, chief clerk, the superintendent of transportation; J. H. Grady, Portland agent, and A. H. Peterson, Spokane agent.

They admitted the discrimination and explained by the fact that the Oregon state public service commission had refused to permit the company to allow the same increase in intra-state express rates as the state commerce commission had permitted on interstate express rates.

It was mutually agreed that the Portland rate should be increased to the level of the Spokane rate, and that the weight of 115 pounds per five-gallon freezer, on which Spokane shippers pay, should apply to Portland as well. The rates in question apply to eastern Oregon points from Portland and Spokane.

PACIFIC ASSOCIATION PREPARING FOR VISIT TO CANADA.

Plans are rapidly going forward for the annual convention of the Pacific Ice Cream Manufacturers' Association, according to Secretary Bert H. Walker, Tacoma, Wash. The convention will be held at Vancouver, B. C., December 3, 4 and 5. Mr. Walker says the program is nearly complete, and he declares it will be one of the best programs ever prepared for a Pacific convention. He expects a large attendance, much interest shown in the convention in letters reaching his office.

This will be the first time that Canadian members of the association have had the opportunity to enter members of their association at a convention. Vancouver is one of the most up-to-date cities in Western Canada, and manufacturers of that city are expected to show visitors a splendid time during their stay at the convention.

The Second Tests Have Been Made by the Engineers from the Massachusetts Institute of Technology.

THE TESTS show that the cork insulated refrigerator body weighed 920 lbs. more when new than the Zero refrigerator body and after working both bodies on regular routes for five months this summer, the Cork Body weighed 1110 lbs. more than the Zero Body.

At four dollars a ton it will cost \$810.30 a year to haul the extra weight.

This will interest the men who figure cost.

THE NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

YEARS of constant use by the leading ice cream and dairy plants the country wide have proved The Gaulin Homogenizer the most efficient, the sturdiest and the most durable machine of its kind manufactured.

Gaulins have no equal in length of service — they are *built to last*. Many of our original installations are still in daily use, operating with the same high standard of efficiency, in some instances under homogenizing pressures ranging from 4,000 to 5,000 pounds.

If you are contemplating the installation of new homogenizing equipment in your plant, we recommend your investigation of the *superior merits* of The Gaulin.

Standardize on The Gaulin and insure uniformity of the mix.

Gaulin Homogenizers will be on exhibition at the Ice Cream Manufacturers' Convention at Cleveland.

We invite your inspection

Delegates Will Cover Long Distances

Representation from Proverbial "Four Corners" Will Run Exposition Mileage Over the 2,500 Mile Mark

THE exposition will draw ice cream manufacturers from the proverbial four corners of the land. It is interesting to note the distances from the leading American cities to Cleveland, which is very near the center of the nation.

Pennsylvania, of course, will send a large delegation. The gentlemen connected with the Crane Company, the Colonial Company and other Philadelphia and Pennsylvania friends will catch their train and ride 493 miles. On the way they will pick up the Riecks and their friends at Pittsburgh. They will have some Jersey manufacturers along with them.

Baltimore manufacturers and friends in the Cumberland Valley "the gateway to the South" will ride 593 miles before shaking hands with the Cleveland reception committee. The Hoefflers et al of Buffalo will probably take dinner with their families one night and get their toast and coffee at the Hotel Cleveland the following morning after a night ride of 183 miles.

The Cincinnati manufacturers also will have a short, pleasant trip to the scene of action, traveling 244 miles. Manufacturers of Indianapolis will have only 283 miles to cover, while the delegates from the Detroit Creamery and neighboring plants will have only 173 miles to cover. Columbus manufacturers will not mind their trip of 138 miles. Chicago manufacturers are glad they don't have to travel more than 357 miles to take in the show. Our friends down in "Ole Kaintucky" will reel off their 358 miles from Louisville without great weariness.

But distance begins to pick up when President Morris leads his friends down from New England, with Boston 926 miles removed from the ultimate objective.

President Charles E. Landreth will lead his Tarheel friends past something like 600 mile posts before they will be able to answer the roll-call at the opening of the national convention. Their special train is expected to be pretty well filled.

Georgians Have Long Trip.

As this is being written President J. D. Kinnett is making preparations to lead his "Cracker" friends over a distance of about 800 miles. Atlanta is 738 miles from Cleveland. The Georgians were making their preparations at a meeting October 4 at Columbus, about 150 miles below Atlanta.

The people in the Southwest will do the real traveling, though. San Francisco manufacturers will cover 2,693 miles. At Los Angeles they will pick up their friends and resume the journey with 2,562 miles still to go. On the same train will be manufacturers from Phoenix, Ariz., something over a thousand miles from Cleveland.

Up in the Northwest Bert Walker, F. N. Martin and a number of other veteran roadsters will not let a little distance like 2,500 miles deter them. They are on the way now and will be riding two or three days before some folks who think they have a long trip to make are even started.

Our friends in the land of flowers will have to reel off 1,085 miles when they leave Jacksonville, while J. W. Barritt, vice president of the Southern Association of Ice Cream Manufacturers, faces a stretch of 1,293 miles.

People journeying down from the National Dairy Show at Syracuse will have only 350 miles to travel.

Delegates from the national capital will cover about 437 miles.

ASSOCIATION DIRECTOR RACING FROM EUROPE TO EXPOSITION.

William F. Luick is somewhere on the high seas at this writing. He cut short a tour of Europe early in October to rush back to America and take in the national Ice Cream Exposition. Mr. Luick, who is a member of the executive committee of the National Association of Ice Cream Manufacturers, is head of the Luick Ice Cream Company, Milwaukee. He has been an enthusiastic worker for the advancement of the national association for several years.

IOWA MANUFACTURERS TO MEET IN DECEMBER

The annual convention of the Association of Ice Cream Manufacturers of Iowa will be held at Maquokette, December 10, 11 and 12, according to recent announcement by Secretary P. W. Crowley. Hotel Bradford will be convention headquarters.

Officials early this month were making preparations for the program. One of the most interesting convention programs in the association's history is promised.

C. S. Hutchinson of Des Moines is president of the association, R. S. Hadley of Ackley is vice-president and A. N. Sayles of Fort Dodge is treasurer. On the executive board are: C. B. Madison, Edgewood; A. Sidwell, Iowa City; Harry Rex, Creston; B. X. Peck, Madison; and H. F. Lange, Creston.

Poodle Dog officers are preparing to help their friends stir up things for a spirited, get-together meeting.

ARCTIC ICE CREAM CO. SUBSIDIARY ENLARGED

The Arctic Ice Cream Co. has purchased from the Commerce Motor Car Co., the plant and real estate at Green, Mackie, Solvay avenues and the Wabash River way. Walter E. Parker, president of the Commerce Motor Truck Co., announces that all tools and equipment have been purchased by that company, which is re-organizing the Commerce Motor Car Co., and that the business will be continued. Announcement of plans, he said, would be made later.

The modern factory buildings which cover two acres will be immediately converted to the use of the Nizer Corporation, a subsidiary of the Arctic Ice Cream Co. for the manufacture of Nizer automatic refrigeration cabinets. The Nizer factory is at present at 3983 Madison avenue.

WIDOW OF MANUFACTURERS WISHES SHE COULD BE AT CLEVELAND.

"Success to the exposition," writes Mrs. E. R. Holton who operates the Holton Ice Cream Factory, Holton, Kan., since the death of her husband last winter. "I says every manufacturer should attend to get the high ideals and inspirations." She wishes she could be there.

An advertisement placed in "The Review" will put you in touch with just the kind of help you are looking for. Give "The Review" a trial—it's the best way to get results.

Way down South in Dixie

Selling Supplies in the Southern Dairy Industry*

In 1915, I went to the south and started in a little ice cream business, not as a proprietor or owner but merely as an employee. At that time in the state of Mississippi there were very few real ice cream plants or creameries. Today I don't know the exact number, but I have here the names of the members of the state association, this of course, does not include the names of all the manufacturers in the state. Now what caused this rapid growth in this industry? I might ask, What has this done other than make a few spasmodic trips down through the main thoroughfares of the south, and in a few instances sent a catalogue along with them or mailed it to them after the salesman returned?

Now, Mississippi is unlike any of the other states which I travel. There are but two cities of over 20,000 population in the entire state. Mississippi is peculiarly an agricultural state and I believe destined to put my dear old Indiana to shame in the few years to come, so far as the development of the dairy industry is concerned.

Jumping across the state line into Alabama we come into a different situation. While Alabama is behind in some respects, it is in others farther ahead. In fact, Mississippi never will have the cities that Alabama has. It never will have the varied industries that Alabama has. It hasn't the railroad and shipping facilities, it hasn't the labor. I mean the wage earning population that Alabama has.

You know as well as I do that it is a community that has the \$20.00 and \$30.00 a week salaries coming in with clock-like regularity that makes business for us in the ice cream line. One wage earner with nine head of kids and a \$14.00 a week job will consume more ice cream, milk and butter than John D. Rockefeller or Pierpont Morgan, so you can see that Alabama really has a future in the ice cream field. In fact there have been some small fortunes made in it down there in the last six or seven years. While the health regulations are not what they might be they are waking up. Milk peddlers down there with faucet cans and frozen dainty push carts are not as numerous as they are within gun shot of dear old Indianapolis.

Now, I realize that it takes a great deal of confidence in the south to enable one to see things from this angle, but right here let me tell you that if you haven't got just that kind of confidence, you haven't got a chance and you better crawl back home and stay out of Dixie because you will find that they are not quitters and they haven't much use for a quitter either.

I wonder how many of you here have heard tell of these papers, The Ice Cream Review, The Milk Dealer, The Butter, Cheese & Egg Journal and Chicago Dairy Produce. I dare say that you have all heard of most of them. Well, so have I and so have other supply houses. These papers find their way into the very outposts of the

*Extracts from the paper of a supplyman in the southern ice cream trade, prepared for a conference of officials and salesmen of his house.

industry and they carry with them advertisements of our competitors and their goods, but I have more time yet to see this house ad in any of these journals.

What does this mean to you? Many has been the time that I have gone into a man's place of business and found him reading the advertisements of a competitor. He is getting a message from somebody telling him about the superior merits of their goods, convincing him during his spare moments that he should have it. Why do we not capitalize on these hours of our customers in establishing ourselves a reputation of our goods a little more firmly in his memory?

One thing which I intend to do this year is to at least notify my customers in advance some several days before I call, and I am not going to do that on a card, either. I believe the salesman ought to be personally acquainted with his customers and know enough about his business to write him a few lines which do not seem so conventional.

My idea of announcing ones self to a buyer in advance would run more like this:

"Hi, Chief, how you comin'? If the A. T. doesn't go back on me, I'll be seein' you about next row, day after tomorrow or maybe next week, and I'm figurin' on selling you about \$400 worth of cards. Of course, I know you won't ever use them, but they're good stuff for the kids to mark on and you can make post cards out of them, too. I'll show you how to do that when I get there. So long."

PROGRAM ANNOUNCED FOR TEXAS CONVENTION.

Program for the 1923 convention of the Texas Cream Manufacturers' Association was drawn up at a meeting of officers and members of the executive committee of the Texas association at Galveston, October 29. The meeting was held at Hotel Galvez, where the convention will be held, November 26, 27 and 28. Though some changes may be made in the program before the convention, it is thought that most of the speakers counted upon will appear. The program shown in this issue of The Ice Cream Review is the first time.

Officers were highly optimistic over the outlook for a highly successful convention.

J. B. Huff, president of the Texas Longhorn Association's affiliated body, pledged the support of its supplymen.

You can find the person who will be glad to buy your goods, by letting your desires be known through an advertisement in The Ice Cream Review.

YOUR CONVENTION HEADQUARTERS

May we offer you the comfort of our ?
lounge at the Cleveland Exposition.
As in the past, it will be free from any
hint of business, and will be solely devoted to the com-
fort and relaxation of our visitors.

We invite you to make this your head-
quarters, and to use it as a medium for
locating and meeting your friends.

G. R. RYAN MANUFACTURING COMPANY INCORPORATED Rochester, New York

THANKSGIVING, already very close, marks the end of the harvest
for the farmer—but only the beginning for the ice cream manufac-
turer who tickles public palates with fruit custard ice cream
made from

Reyam Fruit Custard

Is complete without additions or mixing. A half-gallon makes a
forty-quart freeze, golden cream in color and deliciously irresistible
in taste. Use it to make your work lighter and your sales heavier.

Tutti Frutti Mixture

is just another way of saying
“success for mixed fruit ice
creams and ices.” It is good to
the last drop, always uniform and
a bear for building business. Or-
der it now. Like all Reyam prod-
ucts it's guaranteed.

Whole and Broken Maraschino Cherries

Pick and choice of the new crop; packed in all size containers and
offered at most attractive prices.

Crushed Orange Pineapple

a delicious fruit combination for ice
creams and ices.

Chopped Walnuts in Maple

For maple walnut ice cream; has record
for 60% sales increase.

Crushed Peach and Crushed Apricot

Solid pack—cold process—for making fresh fruit creams.

The

CINNATI EXTRACT WORKS

422-424 W. FOURTH ST., CINCINNATI, O.

Write for prices on our complete line of Glace and Crystallized fruits, Citron and Peels. We can supply them in any quantity.

THE NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

Ladies' Auxiliary to S. A. I. C. M. and Other Organizations

"PRESIDENT SALLY" WANTS NEW MEMBERS.

Dear Friends:

The October issue of The Ice Cream Review has just been received. I thought surely there would be a dozen or more interesting messages from the ladies but I am sadly disappointed. You have all read with interest the appeal for new members from our worthy Secretary Mrs. Geisel, and I do hope you will get after your friends and interest them in our auxiliary. Also get after the men folks and tell them they must bring their "lady" with them to Little Rock.

You have all read the greetings from our little Southern Beauty, Mrs. Florence Evers. She is just as charming as ever and is planning on being in Little Rock.

The days for our gathering in Little Rock will soon be here and any of you that have not made reservations please do so now. I am counting the days until I see you all. Your officers are planning a royal good time for all the ladies attending the Southern convention so make your plans now and don't fail to come.

Traveling for me is just beginning. Tomorrow evening October 3, I am leaving for Syracuse where the National Dairy Show will be held, then back home for a week, when Mrs. Wegener, myself and the rest of the Hudsonites will go to Cleveland for the National Ice Cream Manufacturers' Convention. We certainly are looking forward with great pleasure to seeing some of you in Cleveland. Don't forget to look us up at Booths Nos. 138-139-158-159. A most cordial welcome awaits you there.

Anticipating the pleasure of seeing some of the ladies in Cleveland and each and everyone of you in Little Rock, beg to remain with best wishes.

Most sincerely,
SALLY H. MAHONEY,
President.

FROM THE VICE PRESIDENT, MRS. MASSEY.

Dear Southern Manufacturers and Dixie Flyers:

In reading Mrs. Geisel's letter in the September issue I feel myself aroused to make a statement while there is still time to bring it to the attention of prospective visitors to the Southern Convention at Little Rock.

Mrs. Geisel's letters were certainly well written and read like good advertising, yet they did not bring the desired results. This means there is something wrong. I think the men must have seen them. This message, therefore, is addressed to the men, (and please Mr. Editor, put bells on it so they cannot escape it.)

Perhaps we have not impressed upon them the good reason why the women should come to the convention, and come as members of the Dixie Flyers. It means that they will be met by our committee and taken care of as soon as they arrive and until they leave.

The dues are used for the entertainment of the members themselves, for our get acquainted luncheon and other entertainments. The lady's name and address and two dollars sent to our secretary, Mrs. E. B. Geisel, P. O. Box 257, New Orleans, La., will insure her of membership.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

Let me assure you, if assurance be necessary, our officers and committees are doing their work in the love of it, our pay being the enjoyment you get out of the convention.

Another thing you men may appreciate is that we are spreading propaganda that you may get some play and sightseeing during the convention in going into the city and out again without a chance to see any of the attractions it offers. You pay your money to come to the city so why not see it before leaving?

Going back to the subject of the women's organization I know the men have a better time when they are with their wives are enjoying themselves, and once met with us and taken part in our good time, no woman will ever stay away if she can get to a convention.

We are looking forward to the next convention. The little folks look forward to Christmas. We are going to have our good friends whom we met and enjoyed through the year being members will be there, and we are going to have such a talk-fest that none of you men would want to be near, so you had better send in the membership card now.

Expecting to see everyone at Little Rock, I am

Sincerely,

MRS. R. J. MASSEY, Vice President
Ladies' Auxiliary Dixie Flyers

Wolfhounds

WOLF HOUNDS TO PLAN CONVENTION ENTERTAINMENT.

As you probably know already, our president Claude H. DeRoach is leaving the firm with whom he is now connected, and is going into a different line of employment and will not be connected with the Wolf Hounds.

As you probably know, the president has the honor to appoint committees, and since he is not going to be active with the Wolf Hounds, there is considerable delay in getting things lined up.

The writer is making an effort to get in touch with C. R. Hauk, who is vice-president, and who will be president now, and will get some information which I will pass along to you.

The Oklahoma Ice Cream Manufacturers will hold their convention November the 21st, 22nd and 23rd. Headquarters to be at the Hotel Tulsa, Tulsa, Oklahoma.

Very truly yours,

OTIS B. WITTE, Secretary

MICHIGAN ICE CREAM SHORT COURSE.

An ice cream course for experienced makers will be offered at the Michigan Agricultural College, Dairy Department, March 10 to March 21, 1924, it was recently announced. In this course will be taken up the manufacture, sale and advertising of ice cream, condensation of ice cream mixes, standardization, and causes of control of swell. Additional information may be secured from the dairy department of the College, Lansing, Mich.

THE NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

CONVENTIONS HAVE DEVELOPED INDUSTRY.

By Bert H. Walker, Secretary, Pacific Ice Cream Manufacturers' Association.

There is nothing more helpful than to be able to attend a national convention in the ice cream industry. You meet your fellow manufacturer on a common level where you can discuss at will the problems of greatest interest to you, but benefit much from the expressions of keen minds that have given much thought to the papers and addresses contained in the program, the subjects selected together with the men who are asked to present them are of vital interest to every man interested in the business, consequently the ice cream man, large or small, member or non-member who does not attend will be a personal loser to a greater extent than they think. The time and expense to attend these conventions is in my opinion one of the best investments any manufacturer can make, and each year's budget could well afford a sum for that purpose. I also believe wherever possible it should include as many of your plant and executive force as your judgment dictates. It is hard to pass the information they can gain personally on to them from the viewpoint of the "old man."

While on the subject would like to add a word for the exposition of the supplymen. Naturally some of you may say, it's a wonderful show and we are going to pay for it, but how could you gain the information that a trip through that collection of exhibits will give you for many times the price the manufacturers have to add to their selling costs to present it to you as they will in Cleveland. Some may think it a case of "the tail wagging the dog," but I believe the supplymen are to be commended for their enterprise in putting on a show that is as comprehensive and representative of the

materials and machinery used in the ice cream industries.

The ice cream associations need more real men, not just convention members, those who join and pay their dues and sit back to let "George do it." We should receive a communication from the Secretary and say, "I will take that up later." It is a matter of regular routine in your correspondence to answer it and do your part to assist the officers of the association, who devote so much of their time and energy to your benefit.

Ice cream occupies an enviable position in the food industries, which is directly the result of the efforts of a few big broad minded and progressive men who have spared neither their time, money or energy in their desire to place the product on a high standard of quality and purity. The association has grown, and the demand for the product has more than kept pace with it. We now call it the "national dessert." I believe it should be changed at Cleveland to the "international dessert." Why restrict it to one nation? Appetites are not confined to any one country. Here at the 1924 convention at Cleveland will eclipse anything before attempted, and I confidently believe it

ICE CREAM IN EUROPE NOT VERY POPULAR

You may lead them to the fountain but you can't make them drink—ice cream sodas! So answer the department of commerce when business men ask the possibilities of introducing American ice cream sodas in foreign countries.

Only in England is the American soda-fountain taking over at all. An American, owner of a department store in London, put in a fountain about 12 years ago but people went only to look at it, seldom to patronize it. It wasn't until England had a hot summer in 1911 that cool soft drinks and ice cream dishes began to become well known.

Even so, the amount used seems very small in America. Throughout all of the British Isles this year about \$200,000 worth of soda fountain supplies—fountains, juices and syrups—will be used. One of our large firms uses that amount in a week.

Name almost any other country you can think of and if you think of an ice cream soda at the same time the answer is, "Try and get it!"

For instance, the consul in Portugal says: "The people have an inherent dislike for cold drinks. They are afraid of chilling the stomach. Even when we serve ices, the portions are very small compared to those in an amusement park as a novelty, probably the consul thought it 'to attract people who have been in the United States'."

In Copenhagen there is a soda fountain at the amusement park as a novelty, "to attract people who have been in the United States."

Here, as in other foreign countries, most people prefer to go to cafes or restaurants where they can sit and talk and drink coffee or liquor.

In Saloniki, Greece, there are about 20 soda fountains, not in drug stores, hotels or candy stores, but in the street.

None of the general public in Africa, Spain, Norway, Sweden, India or Persia would be quite sure of what they were seeing if they came face to face with an ice cream sundae.

In Mexico ice cream and soft drinks are dispensed by street vendors.

NORTH CAROLINA WILL BE THERE!

It is needless to state that I am enthusiastic over the upbuilding of the ice cream industry, not only in my own state, but for the country at large, and I know of no better medium for its advancement than to attend our state and national meetings,—the state conventions to solve local problems, and the national conventions for problems as a whole.

The efforts of our national and ice cream supply men's associations this year are going to result in the premier event in the history of the industry, and no manufacturer should miss this important event.

Every manufacturer of ice cream who is not a member of his state or national association, knows that his own plant organization is incomplete without co-operation, and sooner or later, he will decide on membership and attendance. I earnestly and respectfully urge these to attend. A successful meeting is now assured, and all that remains is to count the registrations which will exceed any previous occasion. Aside from the business sessions, the social end will be attractive, and from every angle it is going to be a profitable and enjoyable occasion.

NORTH CAROLINA WILL BE THERE!!

Yours very truly,

A. E. DIXON, Secretary,

North Carolina Ice Cream Manufacturers' Association.

A SPLENDID SUGGESTION.

Here is a letter out of the ordinary. It is a real constructive criticism of a little booklet which we mailed to a large ice cream manufacturer in a middle western state. We asked for his criticism and we got them.

We are publishing his letter in full except that we are withholding his name and address. The original letter is on file in this office. Read it carefully. It is full of good advice for men in the ice cream industry. Here it is:

September 1st, 1923.

Editor The Ice Cream Review:

"In your booklet, 'A Study of the Ice Cream Industry,' you ask for suggestions, and we take the liberty of submitting one.

What the industry was 'yesterday' is history; what it is 'today' is a result of constructive thought and action on the part of the leaders of the industry,—and in that category come supply men and trade papers, as well as the ice cream manufacturers; what the industry will be 'tomorrow' depends upon the extent of the co-operation of these same forces.

The leaders in the industry did not become so through accident, but because they had vision, ambition and the will to do. They did not sit idly by wishing for success but invested their time, money and thought, and achieved success.

There is no doubt that the whole industry owes much to these leaders for their present prosperity. And, having secured this prosperity through the example set them by the better element, a lot of the smaller people have within the past few years begun to undo a great deal of the good that has been done and made very determined efforts to tear down the business as a whole, instead of building up. It is an unfortunate spectacle, in some of our larger centers, to see some of the smaller and less successful organizations making concerted and determined efforts to discredit the larger organizations who have reached their present height through sheer ability and to whom the smaller manufacturers owe so much.

Therefore, we believe that the one best suggestion for the future good of the industry is better understanding through mutual confidence and closer co-operation through all the manufacturers, not only locally but throughout the entire country. There is business for all; there are reasonable profits to be made if the manufacturers who are at present not living up to the Code of Ethics of the National Association of Ice Cream Manufacturers, should make up their minds to do so, regardless of whether it means a complete change of policy on account of it or not. There is no doubt about it that better business can only be built up on sound business methods, better and more lasting than through the catch-penny devices of giving premiums in way of furniture, fixtures, fountains, etc., and associating these inevitably with poor quality ice cream.

We believe that articles in your paper on 'Co-operation' and good 'Ethics' would be well received by the trade and would help to eliminate the suspicions and ill-feelings existing at the present time, much of which has been stirred up by one of the newer trade papers in the field."

KANSAS PRESIDENT ON EXPOSITION.

In regard to the letter of recent date, in which you make inquiry as to whether I will attend the national convention at Cleveland, wish to state that I fully intend to go. I think all manufacturers who possibly can should attend.

We all know what organization means if it functions properly, and no organization can function properly without everyone interested doing his bit. No convention can be a success if we all stay at home.

Let's Go!

Yours truly,

W. H. CHAPPELL,

President Kansas Ass'n of Ice Cream Manufacturers.

General Headquarters Everywhere.

Branch in Your Plant.

September 10, 1923.

The General Manager:

Business is not as good with me as it was three or four years ago but I am still living high and think I am going to have a pretty good winter. I have heard of good many ice cream plants that are going to shut down soon as cool weather comes and I know quite a bunch of others that will keep open but won't do anything to make business better. Easy pickin' for me, hey, what?

You know what I live on. I eat profits, as long as they last, then I start in and eat your capital. I've eaten many an ice cream manufacturer out of house and home.

Funny thing about it is, I couldn't do it if they watched me. Many a smart ice cream man has seen me coming and while it wasn't possible to get rid of me entirely, I was kept on half rations till I'd near starved to death.

I figure on spending the winter with you. I never go away for the winter. I'm on the job. (I've got branches in Florida and California, anyway that I'm doing well.) I'm in your plant NOW and, believe it or not, I'm going to hook you for all I can. There's no sure way to 'Pizen' me but I won't tell you what that is.

Hoping to get right fat on your profits and some of your capital between now and May, I am, with your wishes and a hog's appetite,

Disrespectfully,

OLDMAN OVERHEAD.

(Courtesy Michigan Ass'n of Ice Cream Manufacturers.)

MISSISSIPPI CONVENTION PLANS.

Mississippi ice cream manufacturers were just beginning to formulate their 1924 convention plans when some of the officials had to drop this work early this month to get ready for the National Ice Cream Exposition.

President S. N. Sutton advises The Ice Cream Review that the Mississippi convention, as last year, will be held some time the middle of January. The convention will be held in Laurel, this city having won over the president home-town, Vicksburg, in a spirited contest at the 1923 convention.

JOHN J. GROTHE COMPANY'S NEW PLANT.

Officials of the John J. Grothe Co., manufacturers of Zero refrigerator bodies and Zero ice cream store cabinets, Woburn, Mass., early in October announced that they expected their new factory to be completed in time to move in November 1.

and cement block, faces two streets, Conn St. front and Vining St. on the rear. It has 100 feet age and is 205 feet deep, containing 26,000 square feet of concrete floor space. It has a mill construction and gravel roof.

It is planned to make Zero bodies on a prod

The new factory, they say, will be equipped with modern machinery that will enable them to carry on their research work and promptly deliver orders.

The building, which is made of reinforced concrete

basis, all raw materials entering one end of the building in carload lots and being delivered at the other end as a finishing product, with no cross-overs nor trips up or down an elevator on the way.

PLEASANT PRESCRIPTIONS.

By Dr. Wilbur Wright, Sealright Co.

Grouch—Symptom—Pain in face. Remedy—Smile!

Feeling Good—When at your best, divide with the other fellow.

To the Boss—You are the captain of some kind of a boat—get 100 per cent out of the crew.

Co-operation—Get it by giving it, not demanding it.

Home—Mechanics build it. Family life makes it.

Journeys—Day long or year long—has home at the end. Start right.

Heaven—And the other place are on earth, you make them.

Intemperance—Is doing too much of anything.

Music—Voices of the Angels—listen for the money.

Flowers—The Creator's palette, love them, them, pluck them.

The Forest—Nature's Cathedral—Attend so there.

The Fields—The oceans that you can walk on—

The Highways—Lines of social communication—travel them—see both sides of the road.

The Streams—The lanes and by-paths between land. Use them.

The Ocean—God's great cradle—rock in it.

The Mountains—Climb them—see how small is human.

The Sky—Diamond studded canopy—live, sleep, rest under it.

The Birds—They love us, but fear us. Kindness will win them.

Partake of All the Blessings—Think, Work, Drink, Read, Dance, Play.

Lest You Forget!—The 23rd annual meeting of the National Association of Ice Cream Manufacturers will be held in connection with the second national exposition of The Association of Ice Cream Supply Manufacturers, Cleveland, October 22-27 inclusive.

EXPECTS LARGE ATTENDANCE AT CLEVELAND.

The co-operation in our young ice cream manufacturers' association in South Dakota has been a great help to us, and is becoming a strong organization and having a long, profitable season. I look for a large attendance at the National Exposition at Cleveland from South Dakota.

WM. C. GAGNON,

South Dakota Director, National Association of Ice Cream Manufacturers.

NEWS ABOUT SUGAR

Items of Interest for the Ice Cream Manufacturer

Growth of Sugar Consumption in U. S.

By TRUMAN G. PALMER

The world production of sugar which before the war reached 20,000,000 tons of 2,000 pounds and during the war dropped off several million tons, again is up to 20,000,000 of which 2,200,000 or 11 per cent was produced in the United States and its insular possessions.

The U. S. consumption of sugar which before the war amounted to 4,000,000 tons, reached 4,600,000 in 1921 and in 1922 jumped to 5,700,000, an increase of 25 per cent in one year. The United States now consumes 28 per cent of all the sugar produced in the world.

Prior to the war our maximum per capita consumption of sugar was 84 pounds. In 1922 it jumped to 103 pounds. Only Australia and New Zealand now exceed us in this respect. Meanwhile, due to and because of the war, the per capita consumption in the United Kingdom has fallen from 90 to 70 pounds. Germany from 75 to 54; and Russia from 29 to 5 pounds.

Excepting Norway and Portugal all the countries of continental Europe produce sugar from beets and before the war they annually exported a surplus of some 3,000,000 tons.

The European production of beet sugar which before the war exceeded 9,000,000 tons and in 1919-20 had fallen to 2,900,000, last year reached 5,200,000 tons. Nevertheless, in 1922 Germany, normally Europe's largest producer and exporter of sugar imported 180,000 tons against exports of only 17,000 tons.

Although possessing a sufficient sugar beet area from which to produce the sugar of the world, the United States continues to be the world's greatest importer of sugar. Our imports for consumption in 1922 amounted to 3,300,000 tons. During the 5-year period 1917-1921 our total imports of sugar amounted to 16,000,000 tons, for which we paid foreign nations \$2,545,000,000 or an average of \$509,000,000 annually, a sum sufficient to erect 330 one-thousand ton beet sugar factories which would supply us annually with 3,300,000 tons of beet sugar from beets grown by American labor on American farms.

ENGLAND BARS ICE CREAM AFTER 9:30 P. M.

England does not have to contend with prohibition but, according to the ideas of the Ice Cream and Temperance Refreshment Trades Federation, the regulations against the sale of ice cream and soft drinks would make Mr. Volstead envious.

Under the present law the sale of this class of refreshment is prohibited after 9:30 P. M. The bone of contention is that the West End clubs and hotels are allowed to sell ice cream until midnight, while the working classes cannot buy it after 9:30. The regulation was enacted as a wartime measure.

The federation will urge the labor party to place the matter before the house of commons.

You'll make better ice cream if you get "The Ice Cream Review."

CONTESTS PROMOTE SALES.

The use of contests to promote the sale of ice cream is widespread and has proven wonderfully effective in getting people to talk about the product.

The Mansfield Ice Cream Co. of Milwaukee conducted a Mystery Ice Cream Brick contest heavily advertised in the newspapers which greatly increased the demand for their ice cream and enabled them to secure a large number of new dealers. Prizes were offered in the newspapers each week for those who succeeded in guessing what the flavor of the Mystery Brick would be. The contest closed the night before the Mystery Brick was put on sale. It was announced that each brick would be one of twenty-six flavors. The names of the winners were published in the papers the day following the appearance of the brick.

Another dealer offered a \$25.00 camera to the person securing the most votes over a thirty day period. The brick containing one voting ballot. The names of the leading contestants were published daily and a large amount of interest was aroused.

Bob's Ice Cream Co., El Centro, Cal., offered through the newspapers, a cash prize to the one submitting the best limerick of the week about his ice cream. The contest was open to all, and as many limericks as desired could be submitted. The whole town were soon won over by limericks about Bob's Ice Cream, and his sales increased by leaps and bounds.

From book entitled, "The Sale and Advertising of Dairy Products," by N. Clyde Tompkins, to be published by The Olsen Publishing Co.

ICE CREAM MIX FROM COUNTRY PLANTS

There are many country creameries equipped to manufacture standardized ice cream mix, said W. H. White, dairy manufacturing specialist, in address before World's Dairy Congress. This is sold to large manufacturers as well as small manufacturers, but mainly to the latter, he said. Some large manufacturers do not use their raw material directly from the farmer and the purpose of a prepared mix is an easy solution of the raw material problem, according to the speaker. He continued: The small manufacturer finds this same advantage and in addition is usually able to purchase a better mix than he can make himself, for he receives not merely a mixture of cream, milk and sugar, but the services of the technically trained man who has prepared the mix and of the equipment used in its preparation.

"Country plants that are able to make standardized mix without too great an additional expense usually find it profitable. Frequently the only additional equipment needed is an homogenizer or viscolizer. Knowledge of ice cream manufacture is necessary. Success depends on putting out a uniform and high grade product."

Operations of One of Europe's Greatest Dairy Organization

Story of United Dairies, Ltd., London, Eng., Shows Great Development of Dairying in the British Isles

EMPLOYING an aggregate capital of approximately \$20,000,000 and engaging the full-time services of 10,000 persons, the United Dairies, Ltd., London, Eng., is one of the outstanding dairy organizations of the Old World.

While leading dairymen of Europe are making a study of the American dairy industry, it will be interesting to Americans interested in the dairy industry to take note of some of the work that the European pioneers are doing.

told by officials of this company, have more than a vague idea of its total trading operations.

The annual turnover runs into many millions of pounds sterling. As a pound is worth about \$4.85 on normal exchange, it can be seen that this runs into many millions of dollars, speaking from the American understanding of currency.

Of this huge total, less than 31 per cent is represented by the retail sales of fresh milk, for the whole of England!

No. 1.—Refrigerating Plant for making and packing "Creamier" Cream Ice.

No. 2.—Motor-driven refrigerating vans for London distribution of "Creamier" ice cream.

No. 1.—Cheese Pressing Rooms.
No. 2.—Cheese Ripening Rooms.
No. 3.—Cheese-making Vats.

No. 1.—Butter Churn.
No. 2.—Cream Ripening for Buttermaking.
No. 3.—Buttermaking and Butter Packing.

No. 1.—Bottle Washing and Sterilizing Plant.
No. 2.—Milk Bottling Section of one London Plant.
No. 3.—Loaded Delivery Vans for Retail Supply of Bottled Milk.

It is for this reason that The Ice Cream Review has selected the operations of the United Dairies, Ltd., among others, to describe to our readers this month. Readers will do well to read about this tremendous dairying concern and then talk over things with its representatives in this country for the World's Dairy Congress.

The supplying of milk to the homes is but one of the company's many activities, and few people, we are

The United Dairies, Ltd., is among the largest manufacturing concerns in many different branches of industry, its numerous enterprises involving the control of a considerable number of separate and distinct organizations. The country's various products reach virtually every engineer, dairyman, farmer, grocery provision store, chemist, drug store and caterer in the kingdom.

It is the boast of the company that it provides

THE NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

nearly everything, in one form or another that is essential to human life.

Also Makes Dairy Machinery.

The manufacture and supply of dairy machinery is among the special activities of the company. In addition to supplying dairy products, the company also supplies dairy machinery, appliances, equipment and utensils of various kinds. This branch of the company's work is conducted by The Dairy Supply Company, Ltd., the head offices being at Museum St., London, W. C. 1. From these offices are controlled six London depots, in addition to branch establishments at Edinburgh, Cork and Belfast, and agencies for the sale of the products in all parts of the world.

The Dairy Supply Company, Ltd., has the honor of being manufacturers of dairy equipment to His Majesty the King, but of especial interest to Americans is the fact that their catalogues list a variety of 400 different lines, including the renowned "Alfa-Laval cream separators," "the Excel cream separator," testing appliances of all kinds for dairy use, and many other kinds of dairy equipment.

The manufacture of condensed milk constitutes a very important factor in the branch activities of United Dairies, Ltd., which, through its associated company, Wilts United Dairies, Ltd., Trowbridge, and branches, is the proprietor of "Diploma" full-cream condensed milk, "Moonraker" machine-skimmed condensed milk, and "Trojan" evaporated milk.

The manufacture of cheese, the making of butter and the packing of cream are essential branches of United Dairies, Ltd., and the company's familiar "Little Wilts" cheese, the recently introduced "Abbey" cheddar-flavored soft cheese, "bondons," Suisse double-creme cheese, "Honeysuckle" and "Moonraker" butters, and Devonshire clotted cream, are among the most important and widely consumed articles of their kind known to the British grocery trade.

The company does a large exporting trade in their products, particularly in India and the East.

Though far below that in America, the consumption of ice cream is said to be rapidly increasing in England, and the United Dairies is confident that its "Creamier" cream ice will, in due time, prove an important and profitable addition to its many other proprietary lines.

Ice Cream Manufactured.

The manufacture of ice cream and its widespread distribution in specially designed motor-driven refrigerator vans, are phases of the business to which the company is giving particular attention. We are reproducing in connection with this story views showing views of the "refrigerating plant for making

cream ice," and also views of the ice cream delivery trucks.

The dairy farms owned and operated by the company provide facilities for the testing of improved methods of dairy farming. Each of the company's farms has its own carefully selected herd of the finest English dairy cows, under constant veterinary supervision.

The company's important laboratory and research work has made United Dairies, Ltd., recognized leaders in this work, according to officials of the company. Apart from the company's large Central Analytical and Bacteriological Laboratories, under the direction of a chief chemist, with a number of experienced assistants, each of the company's country creameries, condenseries and milk receiving and distribution depots has its own laboratory. It is claimed that since the United Dairies assumed the control of a large section of the retail distribution of fresh milk in London, the infantile death rate had fallen from 109 per cent in 1915 to 83 per cent in 1921, notwithstanding the exceptionally hot summer of the last year.

Importance of Clean Milk Stressed.

The importance of clean milk in maintaining a high standard of purity and quality in the company's milk products, has been stressed by the company, as shown by the views here reproduced of their various dairy production departments.

The pasteurizing of fresh milk, and its distribution among members of the public, is carried out on a large scale. All of the milk supplied wholesale and at retail is carefully pasteurized under expert supervision. To do this the company maintains at convenient London centers, and at each of its numerous creameries, factories and distributing depots, pasteurizing plants of the most up-to-date design and highest possible efficiency, together with expert staffs required for the everyday operation.

The company's milk bottling plants are of the most modern design. Lack of space prevents us from giving more detailed information concerning the construction of these plants, as well as the modern creameries and condenseries operated, but the photographic views herewith reproduced, show that they are of the most up-to-date construction and are operated along the most advanced lines.

Lest You Forget!—The 23rd annual meeting of the National Association of Ice Cream Manufacturers will be held in connection with the second national exposition of The Association of Ice Cream Supply Men at Cleveland, October 22-27 inclusive.

The 1923 Pacific Slope Dairy Show

By ROBERT E. JONES, Manager

"Follow the cow path to the Pacific Slope Dairy Show" is the slogan this year of the dairy industry of the Pacific West.

The third annual Pacific Slope Dairy Show will be held in the Oakland Civic Auditorium, October 29 to November 3 inclusive. That is, as much as possible of the show will be held within the great arena of this magnificent auditorium. The rest of it will be housed under canvas, adjoining the building.

The Civic auditorium is just on the outskirts of the business section of Oakland and is but thirty-five minutes from San Francisco by ferry-boat and electric train. It faces Lake Merritt, a beautiful body of water

Oakland Auditorium where Dairy Show will be held.

surrounded by the city of Oakland itself. The show place is in the center of a population of 1,000,000 people.

Those, who have been familiar with the Pacific Slope Dairy Show since the beginning, tell us its growth in three years has rivaled that of the National Dairy Exposition. The ambition of the Pacific Slope Show Association is as great as that of the national, but we had hardly hoped to grow as rapidly as the great National Dairy Exhibition.

While the Pacific Slope Dairy Show was confined to products, machinery and educational features the first two years, a cattle show has been added for this year. This department, which is the very life blood of any great exposition dealing with live-stock, will be under the supervision of Professor Wm. Regan of the University of California, who has had a world of experience with shows and fairs.

The Dairy Products Division, this year, will be under the supervision of Professor G. D. Turnbow, who had charge of that department last year.

The University of California people have taken a great deal of interest in the show organization. President C. L. Roadhouse, head of dairy industry of the university, is now president of the Pacific Slope Dairy Show Association.

The success of the last two shows was such as to justify the efforts and dreams of the leaders of the dairy industry, who conceived it as the meeting place of the industry for the great area of the United States west of the Rock Mountains. Not only this, but also the place to which will come those of the Far East,

South America, Mexico, Western Canada, and the Philippine Islands and Hawaii, who wish to buy American dairy stock, dairy products and machinery for use in their homelands.

So successful were the last two shows that this year brought forth the Pacific Slope Dairy Show Association, with the following named officers: President, L. Roadhouse; vice-presidents, Geo. W. Prising of San Francisco, W. E. Haley of San Francisco, R. A. Cond of Chino; secretary-treasurer, Sam H. Greene of San Francisco; manager, Robert E. Jones of San Francisco.

Many of the directors have been named, but the entire directorate is not yet complete. The names of the will, therefore, be announced at a later date.

Dairy Council Takes Lead.

California Dairy Council has taken the leadership in establishing the show and is lending Robert E. Jones, who is publicity director of the council, to the show as manager. It is expected that when the association completely organized this year, the show will begin to function as an independent, though allied, organization with the coming of another year.

Particularly gratifying, the management feels, is the fact that Mayor John L. Davie of Oakland and other mayors, officials and prominent business men of the East Bay cities have taken such an active interest in making the show a success.

Some of the features of the Pacific Slope Dairy Show will be:

1. Exhibits of dairy products from Pacific Slope states entered in competition under the supervision of Professor G. D. Turnbow of the University of California.
2. Dairy Cattle Show, in which the best of Pacific Coast purebred Holsteins, Jerseys, Guernseys, Ayrshires, etc., will be entered, under the supervision of Professor Wm. Regan of the University of California.
3. Exhibits from states and counties of the Pacific Slope portraying opportunities for new comers, particularly featuring dairying opportunities.
4. Comprehensive display of the most modern dairy machinery and appliances for creameries, ice cream plants, evaporated milk plants, etc., and for the dairy farm.
5. "The Story of Milk," an educational exhibit; a complete creamery in operation; Cheese—"From the Milk Can to the Grocery Store." These are some of the special displays which will be of interest to the housewife and the city man, as well as to those of the dairy industry.
6. Exhibits by the State Department of Agriculture, California College of Agriculture, and Dairy Councils, featuring educational work being done for dairy improvement and human nutrition.
7. Entertainment—The program for entertainment is a comprehensive one, including band and orchestra music for dancing; "cabaret dairy lunch"—something new; "The Merry Dairy Fairies;" music by radio from Pacific Coast cities through eight clear-toned audiophones; Pacific Coast Dairyman's "Barnyard Golf" sweepstake; visit to California Agricultural College, etc.; and the Baby Show.

Eastern Visitors Expected.

While most of the exhibits and visitors to the Pacific Slope Dairy Show will come from states west of the Rock Mountains, it is definitely known that many people of the dairy industry will come out from the East. The show will follow closely upon the World's Dairy Congress—the first one held in seven years, at Washington, Philadelphia, and Syracuse—and upon the close of the National Dairy Exposition at Syracuse.

Delegations of the World's Dairy Congress, particularly those who will return home by the Pacific routes, will come directly to the Pacific Slope Dairy Show.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

When You

Choose a Cabinet Consider Its Tank

As every ice cream manufacturer knows, the tank of an ice cream cabinet determines to a very great extent the life of the cabinet—A tank that will stand up to all abuses and give real service is worth while.

Why the **TIFFANY** Cabinet Tank is the Greatest Improvement in Cabinet Construction in Years

TIFFANY cabinets are lined with a tank twice as heavy as the standard tank lining—The tanks are made of No. 18 gauge hard steel, which is harder to puncture with icing bars than pure iron, which is soft.

All tanks are welded, not soldered, and when the tank is finished it is hot dip galvanized, which puts on a zinc coating four times as heavy as most commercial galvanized sheets.

There are no packing washers or lock nuts to play out on TIFFANY tanks. Instead they have a threaded connection for the drain nipple which is $\frac{1}{2}$ " thick and is welded directly to the tank. A leak here is impossible when the drain nipple is screwed in tight. All tanks are fitted with a 1" brass nipple and have a special drain cock.

Other features in this cabinet will appeal to you.

Every manufacturer should read our booklet on cabinets. Sent upon request.

TIFFANY & COMPANY, Inc.

Manufacturers of Good Ice Cream and Soft Drink Cabinets

CARBONDALE, PA., U. S. A.

A CABINET IS AS GOOD AS ITS TANK

These delegates are mainly high dairy officials, professors in agricultural colleges, and men who are interested in directing immigration from their countries to the right place in America.

Californians, Inc., which is a California publicity organization, has taken a definite interest in the dairy show. It will send, to a list of 2,500 preferred prospective dairy farmers, a definite invitation to come to the Pacific Coast while the dairy show is being held. This will mean that many newcomers will be on hand, seeking information as to opportunities in dairying on the West Coast. They will gather their information through state and county exhibits, and from producers, manufacturers, manufacturers and dealers in dairy machinery, and representatives of the colleges of agriculture, who will be in attendance.

In connection with the show, there will be from fifteen to twenty meetings and conventions of organizations allied to the dairy industry, such as creamery operators, producers' associations, dairy inspectors' conferences, and dairy council meetings.

For the women, in addition to the educational and lighter entertainment features of the show, special arrangements are being made by a general committee representing all of the Oakland, Berkeley, Alameda, etc. woman's clubs. Open house will be maintained in East Bay cities by the women's clubs, and sight-seeing excursions are being planned.

These are some of the things for the 1923 Pacific Slope Dairy Show. The enthusiasm evidenced by the entire industry is such as to warrant the predication that it will be the biggest event in the history of the Pacific Slope. The show is on its third year now. Its future is assured. It will continue to grow in usefulness and size from year to year because there is a definite need for a Pacific Coast meeting place of this most complex industry, where all individuals, factors, and agencies can come together once a year to discuss and solve problems, to exchange ideas and plan for sound growth.

Future For Pacific Slope Dairying.

Sam H. Greene, secretary-treasurer of the Pacific Slope Dairy Show Association, who conceived and promoted the first Pacific Slope Dairy Show, says:

"There is a glittering future for a great dairy show on the Pacific Slope. The prospects for dairy development in this region are almost without limit. The human population increases at a greater rate than in any other section of the United States. This fact assures a constant expansion of local demand for dairy products.

"The climate of the Pacific Slope states is ideal for the dairy cow. Nowhere in this great area is it necessary to keep her in expensive barns through long winter

months of cold and snow. The summers are mil long days of sunshine. These conditions, combining the wonderful capacity of our soils for feed tation, make it possible for us to develop high prod animals under the most favorable conditions.

"It is inevitable, therefore, that this great will become the greatest breeding and product in the United States.

"At the present time the Pacific Coast, w developing a very respectable export trade, is s dairy products to supply the demands of i people.

"The Latin nations which border the South Ocean, the native dwellers in the Hawaiian, Ph and other islands in the South Seas, and th Oriental races of India, China and Japan, are ginning to learn that their dietary habits do r vide adequate nourishment for proper growth velopment, and that these are supplied in the forms in milk and the products of milk. The sec rinderpest, which in the past has made it im to establish dairy herds in these regions, has been conquered by a veterinarian of the United Department of Agriculture, and this opens the a steady development of dairy production in the pine Islands, in Japan, and in the American mis compounds of China.

"All of these facts and more can be visualiz through the agency of a great annual assembly mals, machinery, products, and of the people in in them. The Pacific Slope Dairy Show fulfill requirement, and thus its future growth and it are assured."

PACIFIC COAST MANUFACTURER BUILD CESS WITH QUALITY PRODUCT.

In presenting a recent sales talk on ice cream the opportunities before manufacturers, W. P. the Impruv-Mix Co., New York City, called the ae of manufacturers to the plant of The Crystal Storage Co., Portland, Ore. To the progress d plant quality production is attributed.

Under the direction of George Weatherly, ps of the company, this company's product is made a way as to appeal to the consumer. A recent is Western publication, says of Mr. Weatherly: "H millions of people happy."

"A greater ice cream industry makes its a your plant," says Mr. Abel, in his sales talk. "o yourself a factor in the advancement of ice cream national industry. You strengthen the industry its expansion and create a greater demand for a tional dish' by raising and maintaining qual

"Quality and profits are synonomous in h cream industry," says The Ice Cream Review in a torial (see page 4, May, 1923, issue).

"We have found that quality-volume-profits o in hand. Your success is in presenting a prod real merit—supreme quality. Most important is the dealer is to reach, secure and hold him byh your product make an appeal to the consumer.

"Ice cream is judged by appearance, textu taste. The appearance should be cream-like ailing. When placed on the tongue, the touch shu tablish its velvety texture. The cream flavo cream is often referred to, but it is really an cream."

Effect of Composition on the Palatability of Ice Cream

By OWEN E. WILLIAMS and GEORGE R. CAMPBELL*

Factors Affecting Quality of Ice Cream.

It has often been said of ice cream that its palatability would be impaired by making it rich in milk solids and sugar, particularly, if the fat content was too high or exceeded 14 per cent. The correctness of this statement has generally been questioned, although it has never been shown in a systematic way the actual effect which desirability may be altered by using various percentages of fat, sugar, and other constituents in the manufacture of ice cream. Manufacturers have also obtained much information of this character by experimenting with different formulas in their factories and comparing the results. Many soon found the quality of their product depended on three main factors: first, the quantity of milk solids the ice cream contained (composition); second, the initial quality of each ingredient; and third, workmanship.

It is an effort to show how important the first factor, composition, may be to the quality of ice cream, several experiments have been made to determine what would constitute a relatively good proportion of each of the principal classes of solids, namely, fat, cane sugar, milk solids not fat, in the mix. A similar experiment was also made with gelatin as an ingredient in ice cream.

EXPERIMENTAL WORK.

Effect of Mixes and Conditions of Whipping and Freezing.

The size of each mix made for these experiments was about one pound. The treatment given to each set of mixes was always the same, although it was purposely varied in different sets in the same experiment. Usually one set of mixes was sufficient for at least two days' sales. The ice cream was sold to department employees during the noon lunch period, between 12 and 12.30. Some mixes were pasteurized and aged for from 24 to 48 hours. Others were homogenized and aged for longer periods before freezing, while some sets of mixes were aged also varied.

The whipping and freezing was done in a horizontal brine freezer. The brine temperature varied from 10 to 15 degrees F. on some days to 15 degrees F. on other days, with the speed of the freezer kept fairly constant. The ice cream from each mix was hardened in a cabinet packed with crushed ice and salt. The amount of inflation (swell) obtained in the different mixes of ice cream ranged from 42 to 93 per cent. The ice cream was always hardened in and dispensed from the same cabinet, so that the temperature and conditions which might affect it were practically alike throughout the time it was offered for sale.

Method of Comparing the Different Ice Creams.

The difference obtained in the ice creams made in the experiments was measured by means of a market test. About 50 daily purchasers had an opportunity to choose from three different kinds of ice cream. Their choice was then taken to represent the degree of desirability of each kind offered. A nominal flat charge was made for each daily portion of ice cream. No attempt was made to charge according to a sliding scale according to the composition of the ice cream, because this would disclose the difference in quality and defeat the purpose of the test.

This is a new method of measuring the desirability of ice cream, and we believe it has many advantages over the score-card method. Since it is not difficult to

obtain the opinion of a much larger number of people with this method, it is probably more reliable than the score-card method. Instead of submitting a sample of each different kind or batch of ice cream to be scored with a score card, we first classified the experiments relative to the ingredients and limited the number of ice creams in each experiment to three, so that the major differences would be in the same general direction in each group of experiments. Then while the treatment given the three ice cream and the conditions of freezing and hardening were kept the same, the ice creams were placed on sale for a period of 10 or more days.

The ice cream was sold daily to the purchasers, who did not know what variation had been made in the composition. Each purchaser was provided with a weekly coupon ticket, entitling the recipient to one-half pint each day.

The purchasers were given a sample of each kind of ice cream on the first day in order to compare the three kinds, and were informed that on the following day or days they would be given their choice of the three kinds of ice cream. Sometimes comparison of samples was made twice a week, but usually only once a week. The purchasers, however, could change from one kind of ice cream to another at will.

Effect of Fat Content on Palatability of Ice Cream.

In this experiment a comparison was made of three ice cream mixes that contained 18, 15, and 12 per cent of fat, while the other constituents and methods of manufacture remained the same. These three mixes, designated as F, D, and E, respectively, were sold on each of four consecutive days for three continuous weeks.

The total number of sales for the period covered was 551, and the number of persons (adults) who purchased was 67. Of this number 316 sales were made to 27 persons, as shown in Table 1, who purchased the ice cream regularly each week during the 3-week period.

Table 1.—Preference for different proportions of fat in ice cream by 27 purchasers on 4 days in each of 3 consecutive weeks.

Mix	Times chosen by each purchaser												Total sales	
	No.	1	2	3	4	5	6	7	8	9	10	11	No.	Per ct.
F, 18 per cent fat...	11	11	4	11	11	2	10	10	12	12	10	10	11	79
D, 15 per cent fat...	0	0	4	0	1	4	2	0	0	0	0	0	0	22
E, 12 per cent fat...	0	0	4	0	0	6	0	2	0	0	2	2	0	21
Times chosen by each purchaser													Total sales	
F, 18 per cent fat...	11	8	10	12	9	9	12	6	11	11	7		259	82.0
D, 15 per cent fat...	0	4	2	0	2	0	0	5	0	0	5		33	10.4
E, 12 per cent fat...	0	0	0	0	1	2	0	0	1	1	0		24	7.6
Total.....													316	100.0

The records of the 316 sales in the table show that 82 per cent were of ice cream containing 18 per cent fat (mix F,) and 10.4 per cent of the sales were of ice cream containing 15 per cent fat (mix D.) This left only 7.6 per cent of the sales in which purchasers favored ice cream containing 12 per cent fat (mix E.) The sales not recorded in the table showed preferences very much the same, 15 per cent being in favor of mix E, 14 per cent in favor of mix D, and 71 per cent in favor of mix F.

These figures show conclusively that the rich ice cream was preferred by a large majority of the purchasers.

Effect of Sugar on Palatability of Ice Cream.

To determine the effect of sugar on the desirability of ice cream, a comparison was made of three ice cream

* Dairy Manufacturing Specialists, Dairy Division, Bureau of Animal Industry, United States Department of Agriculture.

mixes containing 19, 16, and 13 per cent of cane sugar. These mixes, designated as G, H, and I, respectively, contained 14 per cent of fat, and the methods of manufacture were practically the same in each case. The ice cream was sold on 10 different days during three consecutive weeks. The daily sales are recorded in Table 2.

Table 2.—Preference for varying proportions of sugar in ice cream by 82 purchasers on 10 different days during 3 consecutive weeks.

Mix	Days										Total sales	
	1	2	3	4	5	6	7	8	9	10	No.	Per ct.
G, 19 per cent sugar..	28	28	27	27	23	26	25	25	29	34	272	61.4
H, 16 per cent sugar..	10	10	9	9	13	15	15	15	17	13	126	28.4
I, 13 per cent sugar..	5	5	8	8	7	5	3	3	0	1	45	10.2
Total.....											443	100.0

The total number of sales for the period covered was 443 and the number of persons who purchased was 82. The records of these 443 sales show that 61.4 per cent of the choices were made in favor of ice cream containing 19 per cent sugar (mix G;) 28.4 per cent were made in favor of ice cream containing 16 per cent sugar (mix H;) and 10.2 per cent were in favor of ice cream containing 13 per cent sugar (mix I.) In other words, about 90 per cent of the sales indicated a preference for ice cream containing 16 per cent or more of sugar.

Effect of Milk Solids Not Fat on Palatability of Ice Cream.

In the third experiment a comparison was made of three ice cream mix containing 12, 9, and 6 per cent of milk solids not fat, the other constituents (fat, 10 per cent; sugar, 14 per cent; and gelatine 0.5 per cent) and the methods of manufacture being practically the same. These mixes, designated as B, C, and A, respectively, were sold on 30 different days during a period of six consecutive weeks. The daily sales are recorded in Table 3.

Table 3.—Preference for different proportions of milk solids not fat in ice cream by 128 purchasers on 30 days in 6 consecutive weeks.

Mix	Total sales	
	Number	Per cent
B, 12 per cent milk solids not fat.....	665	56.1
C, 9 per cent milk solids not fat.....	305	25.7
A, 6 per cent milk solids not fat.....	215	18.2
Total.....	1,185	100.0

The records of these 1,185 sales show that 56.1 per cent of the choices were made in favor of the ice cream containing the greatest quantity (12 per cent) of milk solids not fat (mix B;) 25.7 per cent were in favor of the ice cream containing 9 per cent milk solids not fat (mix C;) and 18.2 per cent were in favor of ice cream containing 6 per cent milk solids not fat (mix A.) This means that over 80 per cent of the sales indicated a preference for ice cream containing at least 50 per cent more milk solids not fat than is ordinarily found in commercial ice cream, i. e., a preference for 9 per cent or more, instead of about 6 per cent, in ice cream testing 10 per cent fat.

About two-thirds of the total sales in this test were to persons who ate the ice cream for prolonged periods. Thus, 11 persons purchased for 3 consecutive weeks, 12 for 4 weeks, 9 for 5 weeks, and 7 for 6 weeks.

The percentages of preference for the different amounts of milk solids not fat shown by these 39 different persons are given in Table 4. There was not much difference in the results as compared with Table 3.

Table 4.—Preference for different proportions of milk solids not fat in ice cream by 39 persons purchasing it during periods of 3 to 6 consecutive weeks.

Mix	Total sales	
	Number	Per cent
B, 12 per cent milk solids not fat.....	438	53.3
C, 9 per cent milk solids not fat.....	226	27.5
A, 6 per cent milk solids not fat.....	158	19.2
Total.....	822	100.0

Effect of Gelatine on Palatability of Ice Cream

In the fourth experiment a comparison was made of three ice cream mixes containing 0, 0.5, and 1 per cent of medium-grade gelatin, with the other constituents and methods of manufacture kept the same. The mixes were designated as K, M, and L, respectively. They were prepared on nine different occasions. Each mix was pasteurized and homogenized. They were then held for varying periods before being sold, ranging from one to five days. The number made on 10 days during the three consecutive weeks was 623, these sales being made to 66 persons. The results are given in Table 5.

Table 5.—Preference for varying proportions of gelatin in ice cream by 66 persons during 10 days in 3 consecutive weeks.

Mix	Total sales	
	Number	Per cent
L, 1 per cent gelatine.....	394	63.2
M, 0.5 per cent gelatine.....	86	13.8
K, no gelatine.....	143	23.0
Total.....	623	100.0

Table 5 shows that in 394, or 63.2 per cent of the sales the purchasers asked for the ice cream that contained 1 per cent of gelatin (mix L;) in 143 sales, or 23 per cent, they asked for the ice cream that contained 0.5 per cent of gelatin (mix M;) and in 86, or 13.8 per cent, they asked for the ice cream that contained no gelatin (mix K.) This shows that when preference was made for ice cream made without gelatin or with gelatin, the ratio was a little less than 3 to 1 in favor of the one without gelatin.

Influence of Fat Content on Quality of Ice Cream

The fat content of ice cream does not seem to have a great effect on the quality of ice cream as perceived by the eaters, except, perhaps, when it is very rich. A test was made with two ordinary grades of ice cream, one containing 10 per cent and the other 15 per cent fat, showing that the average adult person consumed 341 grams (pints) of the 10 per cent cream and 317 grams (pints) of the 15 per cent cream when given all he wanted to eat.

The test was made by serving groups of from five to seven persons from a weighed can of ice cream. When they had eaten all they wanted, the can was reweighed and the total amount consumed was divided by the number of persons eating. This was done at different times, 6 times with ice cream containing 10 per cent fat and 6 times with ice cream containing 15 per cent fat. The time of this experiment was in March and April, 1921.

Table 6.—Quantity of ice cream of varying fat content consumed on 12 different days by groups of 5 to 7 persons eating at will.

Ice cream containing 10 per cent fat.		
Test No.	Number of persons	Quantity consumed, Grams ¹
1	7	2,100
2	7	1,981
3	7	2,520
4	5	2,390
5	5	2,380
6	7	1,596
Total and average.....	38	12,967
Ice cream containing 15 per cent fat.		
Test No.	Number of persons	Quantity consumed, Grams ¹
7	7	2,177
8	7	1,848
9	7	1,946
10	6	2,226
11	5	1,860
12	5	1,670

Combinations of Ice Cream Ingredients.

Question frequently asked is, What combination will produce the best quality of ice cream? It has been found that a preference is usually given to the ice cream richest in fat, sugar, and milk solids not fat, and an attempt was made in our experiments to ascertain the optimum combination of all these ingredients to produce the best product. To do this would require a large number of tests. The results, however, have been beneficial in establishing one type of combination of ice cream instead of the two types we now have, one rich in fat and the other rich in milk solids not fat. This is a matter that must be left for future consideration.

Summary.

The effect of the composition of ice cream on its palatability was tested by selling ice cream made in different ways to the same persons from day to day, kept in such a manner that the buyers would show no preference, and noting the kinds preferred and the quantities to which they were preferred.

Experiments with varying proportions of fat, sugar, and milk solids not fat, and gelatin in ice cream show that there is a decided preference by consumers for the sweetest, and firmest products. The following express the results obtained:

Effect of Fat.—The effect of fat on the palatability of ice cream is indicated by preference in 61.4, 28.4, and 12 per cent of the cases in favor of ice cream containing 12, 6, and 2 per cent of fat, respectively.

Effect of Sugar.—The effect of sugar on the palatability of ice cream is indicated by preference in 61.4, 28.4, and 12 per cent of the cases in favor of ice cream containing 12, 6, and 2 per cent sugar, respectively.

Effect of Milk Solids Not Fat.—The effect of milk solids not fat on the palatability of ice cream containing 10 per cent of fat is indicated by preference in 55.6, 25, and 19 per cent of the cases in favor of ice cream containing 2, 1, and 0 per cent of milk solids not fat, respectively.

Effect of Gelatine.—The effect of gelatine on the palatability of ice cream containing 14 per cent fat is indicated by preference in 63.2, 13.8, and 23 per cent of the cases in favor of ice cream containing 1, 0.5, and 0 per cent of gelatine, respectively.

Experiments on the influence of fat content on the palatability of ice cream shows that the amount of ice cream containing 10 per cent and of that containing 12 per cent of fat averages practically the same.

L. O. THAYER QUILTS INDUSTRY.

News in the ice cream industry of L. O. Thayer, well known through his twelve years' experience in the industry, which was severed several months ago, is of interest to learn that he has been made vice-president and secretary of the Granite Springs Estates Sales Corp., with headquarters at 42nd St., New York City. The first name is capitalized at \$10,000,000 and the other at \$1,000,000. Mr. Thayer extends greetings to friends in the industry.

Every salesman has a message to tell. Every business has a message to get. This is where the "handle-'em-with-gloves" salesman seldom succeeds. His story is never told to the listener, the dealer who won't be told.

NEW ENGLAND ASSOCIATION OF ICE CREAM MANUFACTURERS.

Secretary's Report of September Meeting.

The September meeting was one of the best meetings that we have had this year. It was held at the American House in Boston. There was a total attendance of 65, 35 of which were active members with two visitors.

President Slingerland announced the following new members:

Active—LaCalle & Taft, N. Hadley, Mass.; Naugatuck Dairy Ice Cream Co., Naugatuck, Conn.; McCarthy Brothers, Whitman, Mass.

Associate—Brooks Cabinet Co., Norfolk, Va.; Citrus Products Co., Chicago, Ill.; Cone Co. of America, Long Island City, N. Y.; Elyria Enameled Products Co., Elyria, Ohio; Gifford-Wood Co., Hudson, N. Y.; Gumpert & Co., S. Brooklyn, N. Y.; Manning Mfg. Co., Rutland, Vt.; McCormick Co., Inc., New York, N. Y.; Meyer Wagon Works, Buffalo, N. Y.; Schantz, Inc., K. W., Buffalo, N. Y.; Timm, William H., Philadelphia, Pa.

It was decided to have the annual meeting about the middle of January at the Copley Plaza Hotel in Boston and that the ladies be invited.

It was voted: To omit the October meeting on account of the members going to the national convention in Cleveland.

Mr. Morris spoke relative to the national convention saying it was going to be the best ever and advised everybody that was going to get their reservations as soon as possible.

It was announced that the New England delegation would leave on the 6:10 P. M. train for Boston, Saturday, October 20, arriving in Cleveland the next day about noon.

On the question of program for our New England meeting in January it was suggested that if anybody knew of a good speaker that they write to the secretary with suggestions for the program. This program is your program. Let us know what you want to have.

Mr. Olsen of The Ice Cream Review spoke briefly to the association. Mr. Lund of the Eskimo Pie Corporation discussed some new plans for the season.

A discussion of winter specialties showed no great enthusiasm for the boxed sundae.

President Slingerland made remarks about the unfavorable publicity in the Boston Post on October 20 relative to bad ice cream cones and its influence on the industry.

He also stated that each was to consider his committee of one to get in new members and couldn't have 100 members for the January meeting. Everybody was given application cards. If you receive one get busy just the same.

The meeting was a very interesting one, last til nearly 5 o'clock.

Don't forget your Pullman reservations for the national convention. Be sure to get a certificate when you purchase your railroad transportation ticket in Cleveland as you get a reduction of one-half after presentation of this certificate in Cleveland.

BROADER VIEWS OBTAINED AT CONVENTION

Editor The Ice Cream Review:

I am pleased to encourage your efforts to make the Cleveland convention and exposition a big success. This is one event of the year when every person interested in the ice cream industry should attend.

The principal developments of the industry are evidenced at the national convention. At the National Ice Cream Manufacturers' Convention, one has an opportunity to rub elbows and become acquainted with the leaders of the industry. Every ice cream manufacturer who attends the national convention gets a more comprehensive idea and broader views of the industry in one week's time, than he can by staying in his plant during the period of a whole year.

I am forwarding my photo under separate cover.

Yours very truly,

J. J. McDONALD, Michigan Director
National Association of Ice Cream Manufacturers

NEW MEXICO PLANT EXPANDS.

The Thomas Creamery Co., Albuquerque, N. M., built a new plant. The first unit is 25 by 75 feet, housing the ice cream department and office. Office reports that they intend to add another unit the same very soon. The building is of cement and hollow.

An eleventh-hour report from the ladies' entertainment committee conveys the information that a complete style show has been arranged for the convention. This will be at Bedell's—Cleveland's newest and exclusive ladies' shop, so we are told. The arrangement comes to the official hostess, Miss Ethel Rhoads.

Ready Soon

NEW REVISED AND
ENLARGED EDITION

Ice Cream Mix

The unprecedented demand for this little practical volume on Ice Cream Mix, its formulas and simple methods of calculating the various ingredients has prompted us to get up a new and larger edition.

Judging from the comments we received on "Ice Cream Mix"—and the fact that the first edition has been exhausted in so short a time—we believe the ice cream trade will appreciate this new and larger edition in cloth binding with twice as much material in it.

Ice Cream Improvers

By E. H. PARFITT*

LITTLE has been written about improvers. This is due to the fact that improvers are a commercial product and the ingredients kept secret from the trade. Because of this fact it is all the more imperative that they should come under our discussion for as I have talked with ice cream manufacturers there seems to be a wide difference of opinion in the advantages and disadvantages of improvers.

In this discussion I am not going to undertake to discuss individual brands of improvers or to leave you with the idea that improvers should or should not be used, but I do wish to discuss with you the chemical constituents of an improver and how it works, so as to enlighten those of you who have not studied the question from the technical viewpoint.

In looking over the literature on ice cream I find that invariably every author has dealt lightly upon improvers, some recommending their use, others discourage their use, while still others fail to even discuss their use.

The authorities of various texts upon ice cream group under one head which they term stabilizers, all those ingredients familiar to us by various names such as colloids, binders, fillers and improvers. Briefly I wish to define each of these.

1. Colloids: Gelatine is a colloid, that is, it remains not in a true solution but a false one. The casein in milk is in a colloidal state, the particles being so small that they remain in a constant suspension (Colloidal gold.)

2. Binders: Tend to cement the ice crystals together. Those that hold together, gums and gelatin may be considered in this phase. The mixture of the two according to "Washburn" give the greatest binding effect.

3. Fillers: A filler is generally some cheaper ingredient put in to reduce the cost, as corn starch. Gelatine may be also considered as a filler.

4. Improvers are substances added to the ice cream mix that will increase the viscosity, in a short space of time, thereby reducing the aging period, softening the milk solids not fat, and therefore improving the body of the finished product by enzymic action.

Improvers produce viscosity within a short space of time by producing a hastened ripening action, by coagulation of casein.

Viscosity or stickiness is important in order to obtain a uniform yield and quality. The phenomena of viscosity is brought about by fibrin filaments of fibrin uniting and combining with other and clinging together in minute threads much the same as blood. This is based on the theory that in milk is the cause of viscosity. Any violent treatment that we give cream as separation, pasteurization, homogenization breaks up these filaments, making it shorter, and as a result the viscosity is lessened. As we well know cream that has been pasteurized whips with difficulty if you attempt to whip it as soon as it is fore pasteurization. There are three ways by which viscosity may be produced.

Three Ways to Produce Viscosity.

1. Aging: Old mix is more viscid than new. According to experiments conducted at Iowa the cream yield was increased 4.72 per cent on pasteurized cream when aged by 24 hours at 33 degrees F. and a further increase of 3.58 per cent in 48 hours after the cream immediately frozen. The physical changes taking place while not definitely understood is believed due to certain hardening of the butterfat and proteins. When gelatine is used in the mix it exerts an influence in viscosity due to the hydration of the gelatine. The temperature of aging should not be over 40 degrees and best at 33 to 34 degrees. Freezing of the mix after ageing will tend to inhibit viscosity slightly.

2. Acidity: It is the practice in some plants, particularly in the east to add a culture lactic organism to the mix and in the process of aging increase the acidity. Acidity is caused by the lactic bacteria breaking down milk sugar or lactose to lactic acid. In the formation of acid the milk proteins are hydrolyzed breaking them down to meta proteins. The acid action on the proteins tends to harden them and if acidity is allowed to get too high they become brittle. A danger in the use of development of acid is that if it is carried little too far a sour mix is the result. The acid increases the viscosity but little if any, according to experiments done at Purdue, unless the acidity is allowed to go too far (sour taste is noticeable at .22 per cent) but may be a factor in obtaining the desirable flavor and texture in the finished product. According to Jonnier and Troy the possibilities of the development of acidity by the use of cultures is a phase of the ice cream industry that is in its infancy and is opening

wonderful possibilities. You have all read with care the article in the Ice Cream Trade Journal of August on acidity.

3. Enzymes: There are two enzymes which are commonly used to increase viscosity and aid in producing the desired body and texture. There are rennet and papsin. They may be used individually or together. They work fast in a warm mix and slow in a cold mix. The two most sold improvers on the market used rennet as the ingredient that increases the viscosity within a short space of time. In one brand it is rennet and milk sugar, other substances may be used but these are the basic ones. In another brand it is rennet and corn starch. As the enzyme rennet is the main factor in improvers, let us consider rennet action and see how it influences the viscosity.

In cheese making, rennet is used to curdle milk and to make it so viscous that it is practically a solid. The rennet acts upon the casein, splitting into two compounds, one which we shall call curd which contains the casein and calcium phosphates and the other compound, whey, which is a simpler compound and contains casein and no calcium phosphates when the curd is acted on by lactic acid lactates of calcium and phosphorus are formed. There are several other theories but this is the most accepted. The action of rennet increases the viscosity there by the production of a solid. If sufficient rennet is added so as not to form a complete reaction to the curd state we then have a heavy liquid which has a high viscosity. The action of rennin softens the caseins making possibly a smoother body in the remaining product. As you well know it is important to read the directions upon the can and you will find that they distinctly specify not to add until mix is at a temperature below 50 degrees F. If you added the improver at a temperature of 80 degrees F. you would obtain a thick curd, similar to the coagulation obtained when making cheese. Try it sometime, using a quart of milk at 86 degrees F. and adding some improver.

Now that you have some idea of what an improver consists of let us take up some of the points the improver is supposed to improve as advertised and see if the same thing cannot be one without it but using nature's forces. Am endeavoring to be neutral in my opinions.

Improvers are claimed to control the growth of undesirable bacteria. What are the undesirable bacteria, the acidifiers and peptonizers. How does the improver combat them? There is no preservative or germicide used. It controls the bacteria by lessening the ageing period necessary to obtain the correct viscosity. The acidifying and peptonizing groups of bacteria do not grow practically at temperature of 33 to 35 degrees F. Hammer in studying the growth of organisms in the ageing vat concluded that there was no growth that could be detected when mix was held at 33 degrees F. for 24 hours. So while an improver does control bacteria because the mix is not aged, the same mix need not have any more bacteria if it is held at a sufficiently low temperature.

You see advertised that the improver controls the lactic bacteria that is just the same as above question, in other words repeating, the lactic acid bacteria can be controlled both with improvers and ageing if the correct temperature is used.

It is said and advertised that improvers accentuate the rich creamery butter flavor. This is brought about by the increase in viscosity, the same viscosity and the same result can be brought by ageing for the correct length of time.

Increases your overrun, this is a debatable fact but I

the same overrun can be obtained by ageing and
renneting if properly carried out.

Makes smaller and more numerous air cells, it is often
if you use improvers the size of air cells depends
on viscosity, the greater the viscosity to a certain
the smaller the air cells will be. The type of
used will depend in a measure on the size of
cells in the finished product. The size and num-
ber of the air cells relate directly to the overrun.

The ice cream improver has its place in ice cream
manufacturing and can readily see its advantages when
there is no time for ageing, that is, the mix is used
as soon as made up, or in the case where a raw
mix is used (unpasteurized and not homogenized). In
cases where the machinery is so arranged that it is neces-
sary to pump the mix from the holding vat to the freez-
ing machines cannot be used to their full advantage,
such as the high viscosity caused by the improver
is reduced to a degree by the pumping anchor, more so
in the case of ageing.

Summing up. The action of ice cream improvers
is aided by the enzyme they contain (rennet or pepsin)
and with milk sugar, corn starch or other ingredients.
The purpose is to overcome the period of time necessary
for ageing the mix and if the directions of the manu-
facturer are followed, good success is obtained.

IMAGINATIVE ICE CREAM MADE IN PARIS.

One of the famous open air establishments in Paris is
known for its "Joseph's-Coat-of-Many-Colours" ice
cream. Quite half a dozen hues are employed; and the
ice cream, having an educational interest, serves Naman as
a means of interesting her offspring in the sad fate
that befell poor Joseph. Little people who allow their
children to wander are fed on a plain brioche, ices only
for the attentive. The maternal Parisienne appre-
ciates the value of knowledge.

An arrival caterer has introduced the "Mistress Poti-
rice, the colouring of which is kaleidoscopic and
suggestive of unholy desire. Monsieur savours it;
Madame confines her attention to the "Joseph's-
Coat-of-Many-Colours" delicacy. Being charged with
the instructing of youth, the blameless lady dare not do
otherwise.

WHY YOU SHOULD GO TO CLEVELAND.

To the man with a growing business there is no
time or money that can be spent which will show
such good returns as attending the National Ice Cream
Convention and Exposition at Cleveland.

I have attended the conventions of this associa-
tion almost every fall for about fifteen years, and I
can truthfully say that I have gone home on every
occasion with one or more ideas which were worth
rich more than the cost of the trip, in some in-
stances ideas that were worth thousands of dollars.

The addresses given at each convention are al-
ways practical; you will be interested in them, but
probably the greatest source of benefit to the major-
ity who attend these conventions is getting an answer
to some questions about your own plant.

Go to Cleveland with your questions. Ask every
man you meet. Don't be afraid to ask him be he
manufacturer or supply man, big, small, prominent
or otherwise. Some man can give you the informa-
tion you need.

Yours truly,

MORDEN NEILSON, Vice pres.,
National Association of Ice Cream Manufacturers.

THOS. J. STEWART,
President Salesmen's Club

TIMID LADS DON'T SELL GOODS.

Famous college president once said, "Football is game for timid lads."

might have said the same about salesmanship. Any salesmen are "timid lads" when it comes to getting real results from their territories and co-operation from their dealers.

In the last twenty-five years a certain salesman has been traveling up and down the Atlantic Coast. He is usually supposed, by the hundreds of road men who know him, to have what is known as a "soft job." He covers three big towns and he sells a large chunk of the entire output of one of the world's largest and finest silverware houses.

Most of his friends tell you about his hearty laugh and his peculiar and amusing manner of sneezing—two things that unfailingly identify him, wherever he goes, to be when he laughs or sneezes.

Ask those who know him, however, and they will tell you about another quality that has had much more to do with his success than either the laugh or the sneeze. They will tell you he's got a bushel of plain ordinary courage. He's had it from the start and he uses it just as much now as he did back in the early days of his business when his job didn't look quite so "soft."

They tell the story of how he sold McCracken, a well-known, hard-fisted hardware dealer in a small town. The house had tried for years to get McCracken to put in a line of cheap silverware. Other dealers had done the same thing and McCracken had repulsed every onslaught by making an irritable disposition of his weapon.

He was naturally uncongenial and the sight of a silverware salesman made him openly hostile. All the dealers who called on him were careful to "handle him with gloves" and to warn the silverware men to stay away from the store.

They all stayed, too, except one. He strode into the store one fall morning, looked around, walked out again and then came back in.

"What'd you want?" asked McCracken, who stood behind the counter.

"I want to find out whether this place is good enough to handle my line," said the stranger.

"Why don't you ask me?" queried the bristling proprietor.

"Because you don't know anything about it. We've been trying to tell you about it for the last three years and you've been too busy to listen. I'm glad of it. You're not equipped to do us justice. I'm going to take your name off the prospect list." So saying he handed McCracken his card and walked out.

Two days later the house got a letter from McCracken telling just what it was they thought he didn't know about their line. They wrote and told him. They sent him some straight-forward stuff that left him with no excuse—things about the line he had never given a salesman a chance to tell. It wasn't long until he was ready to buy and, of course, they sold him. Today he is one of their best small-town accounts.

A sales promotion expert said recently that less than one per cent of the salesmen now traveling are known to their dealers by name. Too many "timid lads" in the business—seven per cent.

Handle 'em with gloves and they'll think you're a fellow.

Treat 'em rough and they'll remember you and give you their business.—The Salt Seller.

THE NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

The Rose of the Dairy Industry's Great Carnival

Four Thousand Men are on the Way, Riding
and Not Alone but Opportunity with Them

THE call has been sounded for ice cream men to rally at Cleveland. It is something more than a call to service; it is a summoning forth of ice cream manufacturers to new visions and new hopes and new inspirations.

It is not conceivable that any ice cream manufacturer in the country with the slightest understanding of what is to be offered in that "wonderland of mechanical magic" to be staged in the Cleveland Public Hall the week of October 22 will let anything stand in the way of his attending.

That which is to be held at Cleveland this month is a mammoth demonstration of what is offered for this industry's expansion and its members' prosperity. It is to be a bringing together of the industry's strongest co-operative pressure, with the supply houses of the industry joining hands with the ice cream manufacturers' great national association in a pageant of progress.

Four thousand people are expected to attend this gigantic trade classic. Have you made your preparations to go? Four thousand people will leave their limited environments and get a view of "Ice Cream—A National Industry." Will you be one of those to gain a new, broader, more thorough viewpoint of this business in which you are seeking to make a success?

Will you go and gain? Or will you stay home and hear others tell you about what a splendidly inspirational affair it was?

Will you let a few obstacles prevent you from seeing the greatest trade affair ever held in the ice cream industry?

Will you follow your own narrow, limited viewpoints, "secure in the abundance of your vanity," and look back in the years to come and say you could have made the same progress that others have made if you had "just had time" to have enjoyed the opportunities they seized?

The call has been sounded, gentlemen of the trade. Cleveland is the rallying point. There is no one to decide this but yourself, and no one will lose more than you if you fail to make the right decision.

Four thousand people will ride trains to Cleveland this month.

They will ride and not alone—but opportunity will ride with them—golden, glowing opportunity.

Increase Your Ice Cream Sales During the Winter Months

Millions of these Packaged Sundae Kups were used last winter, by many of the largest ice cream makers, for marketing Packaged Sundaes. It was the means of increasing their winter sales—made an unprofitable season a paying season. No better time than now to plan for your own winter activities. Get the added profit awaiting all who make and market Packaged Sundaes. Use this, the most practical and neat appearing of all packages. It actually sells its contents.

Strongly made of snow-white spruce-wood-fiber. No objectionable wax. Large unobstructed opening means easy filling and removal of contents. Self-seating lid. Nest when empty—taking little storage space. The Mono-Paper-Spoon is part of the package.

KLEEN KUP

Send for samples, interesting prices and other important information regarding the "Packaged Sundae Idea" that eliminates the problem of selling your winter output.

ICE CREAM WINDOWS INCREASE CONSUMPTION

GOOD window display is a polite and effective invitation. Hundreds and thousands of people pass before an ice cream dealer's store during the course of a day. It is the ice cream merchant's aim to attract a portion of these passers-by and induce them to enter his store. One method for solving this problem might be butting each pedestrian, whispering into his ear and trying to persuade him to enter the store. If the merchant objects, it might be effective to forcibly drag him in. But even if this method were proper and lawful, it is doubtful if the merchant possesses the physical strength to carry out this plan. The ice cream merchant can get around this problem in another way. He can display his window in

DRUGS C. E. STUMP PRESCRIPTIONS

Window was prepared by the Rieck-McJunkin Co. of Pittsburgh.

ice cream and attractive a manner that people will come in of their own volition. A window display is the ice cream merchant's way of saying, "Good come in—you are welcome." All ice cream stores adopted attention-getting window displays, business would be more than trebled in comparatively short time. Some manufacturers agree with their dealers in the matter of creating, stalling window placards, signs, posters, etc. But manufacturers are in the minority, and as a consequence, most ice cream stores have no outward incentive for a person to want to enter the store. We know of countless instances where attractive window displays have doubled business within a brief time. The Colonial Ice Cream Company, of Philadelphia, expends thousands of dollars each year on just window displays alone. The executives of this company are firm believers in effective window trimming. Within a period of two weeks the Colonial Ice Cream Company of Philadelphia recently installed five hundred new window displays. The best dealers in the city were selected for this campaign. Unsolicited testimony from scores of dealers pointed to a general boast in Philadelphia immediately after the displays were installed. They say that the winter months are coming, window displays are more important than ever. When the thirst is over, the merchant will have to make his window display even more effective. A good display should appeal to a man's fancy and lead his footsteps into the store. New faces at a soda fountain often change into repeat customers—and that is the big thing in ice cream selling.

Convention Booth 44 Invites You!

Come on over and let us treat you to some delicious samples of ices, ice creams and sherbets flavored with

Ella Brand Flavors

THESE are the same distinctive ice cream flavors until recently prepared by Orange-Crush Company. In June, 1923, we took over the entire Orange Crush Ice Cream Compound business, the Orange-Crush Company having expanded to a place requiring exclusive attention to the sale of beverage flavors.

We will continue to produce these delicious flavors under the identical formulas and supervision of the Orange-Crush Laboratories, assuring you of the same high grade quality, the unique flavor and deliciousness for which these compounds have become known from coast to coast.

You, of course, understand that we could not purchase the trade names, "Orange-Crush," "Lemon-Crush," "Lime-Crush," "Ward's Cherry" and "Ward's Grape," and although the products will be the same, we will market them under the Ice Cream Flavoring trade name of "ELLA BRAND."

At the Exposition

We Extend You a Cordial Invitation

WHEN you're swinging down the aisles at the Cleveland Ice Cream Exposition and come to the Hudson booths, don't stop to knock. Just walk right in. We'll have "open house" all the time. There'll be free parking space—and you won't have to tip our bell hop to get service.

You will attend the Ice Cream Exposition to get better acquainted with the trade and to get ideas which will help your business. Don't fail to investigate **HUDSON'S No. 52 SPECIAL**. If you are not already using it in your ice cream we would appreciate the opportunity of demonstrating it to you.

HUDSON'S No. 52 SPECIAL is a vanilla flavor scientifically blended to meet the exacting demands of ice cream manufacturers who have made a reputation for the flavor and uniformity of their quality. It will not freeze out—it is 100% soluble and its purity and strength means economy. That's why it is so popular everywhere.

We Extend You a Cordial Invitation
to Visit Our Exhibit.

THE NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

gestion of other foods, and to furnish its quota of Amino Acids to make other proteins of greater nutritive value. Gelatine is a substance which stimulates the flow of the gastric juice; in other words, it has a stimulating value. As a source of protein itself, it cannot meet all of the body requirements, but in many combinations with other proteins, it makes a very superior food.

Prof. E. V. McCullom in the "Journal of Biological Chemistry," Vol. 28, Page 403, showed us a result of his experiments with the use of gelatine in connection with wheat and oats that the gelatine greatly increases the nutritive value of the proteins of both. Experiments made by Dr. Downey of the Mellon Institute have shown that the addition of gelatine to rye and barley bran brought about a satisfactory food, that is, the gelatine supplemented the vegetable protein and made them satisfactory for growth and development. Gelatine contains a relatively high percentage of amino acid lysine, and Prof. McCullom based his interpretation of his results largely on the lysine content of gelatine.

At the present time, there is being carried on at the Mellon Institute a very extensive series of feeding tests by Dr. Thos. B. Downey in confirming previous work which has been done along these lines, and so far these results have been very striking, in that they have shown that the addition of gelatine to wheat, barley, and rye has greatly improved the food value of them.

Another important development which has been brought out is the use of gelatine in Infant Feeding. In 1879, Dr. Jacobi, a prominent New York Physician, recommended the addition of gelatine to cow's milk for bottle babies. A few years later, Eustis Smith corroborated the experience of Dr. Jacobi in his book, entitled, "A Practical Treatise on Diseases" in which the casein of cow's milk may be made digestible consists in

mechanically separating the particles of curd by addition of some thickening substance, such as gelatine."

Jerome Alexander has recently explained this of gelatine in milk. He pointed out that casein is an unstable colloid, which is protected from coagulation by a stable colloid, lacto albumen, and he shows that milk is low in lacto albumen as compared with other milk. Therefore, the addition of gelatine acts as a protective colloid, so that when the milk enters the stomach the acid of the stomach coagulates it in minute particles, which are readily absorbed and quickly digested; whereas, ordinary cow's milk entering the stomach is coagulated in large size curds, which are difficult of digestion and often are not digested at all.

Dr. Herter found that the addition of gelatine to milk in serious cases of mal-nutrition was of very great benefit. As a matter of fact, recent literature is full of reference to the value of gelatine in connection with milk in infant feeding.

Recently, I made some tests on milk containing varying quantities of gelatine from one-half percent to 10 percent, coagulating the milk with a lactic acid starter. The difference in the sizes of the curds and the quantity of the serum was very remarkable. The milk containing 1 per cent to 2 per cent of gelatine was smooth in appearance and did not separate at all when standing. You can readily realize that in feeding infants and invalids, the physical difference of the curds would be a great factor in its digestion.

In conclusion, I want to say that the work done by the department of agriculture in this investigation of the manufacture of edible gelatine was undoubtedly the greatest value to the industry, and the establishment of standards for metallic contamination, although at the beginning seemed a hardship to the industry, has usually proved to be a great and lasting benefit. American made edible gelatines as a whole are superior to imported gelatines in freedom from metallic impurities.

I have no doubt but that the establishment of material standards would also be of great benefit to the industry as well as to the consuming public. The manufacturer, Ice Cream man or anyone using gelatine can improve the quality of his products by using a gelatine he knows to be as free as possible from mineral and bacterial contamination.

REDUCED RAILROAD RATES TO ICE CREAM EXPOSITION.

Ice cream manufacturers attending the 23rd annual convention of the National Association of Cream Manufacturers at Cleveland, Ohio, October 22-25, 1923 and not visiting the dairy show will secure the benefit of a rate of a fare and one-half on the round trip on the certificate plan, according to announcement by Secretary N. Loewenstein.

"Purchase a regular one way ticket from your home station to Cleveland, Ohio, and ask the ticket agent for a certificate," says the secretary. The certificate will then be validated at the registered headquarters at the Cleveland Hotel and will entitle you to purchase a return ticket to your home station for one-half of the regular fare. Be sure to secure a certificate when purchasing your ticket. Tickets will be on sale as follows:

"British Columbia, Oregon and Washington, October 16-22. Colorado, Idaho, Montana, New Mexico, Oklahoma, Texas, Utah and Wyoming, Oct. 17-24. All points East of above, Oct. 18-24. Final round trip limit Oct. 31. Manufacturers attending convention from California and other Pacific coast points will be able to secure the regular reduced fare, "All Tourist Tickets," having nine months return limit."

MECHANICAL MAN USED IN ICE CREAM WINDOW DISPLAY.

A. A. Comey, general manager of the Globe Ice Cream Co., Los Angeles, introduced to Los Angeles recently a very unique idea in the way of window advertising for the dealers—a mechanical man that sits in the window to advertise Globe ice cream. This mechanical man rolls his eyes, winks at the public, moves his eyebrows up and down, turns his head and moves his lips, and reaches into a mahogany case and pulls forth sixteen different ads calling attention to the merits of Globe ice cream.

Mr. Comey will attend the national convention to be held in Cleveland next October, and he states that he is willing indeed to explain to other ice cream manufacturers the value of good advertising from the ice cream manufacturers' and the ice cream dealers' standpoint.

Before entering the ice cream industry, Mr. Comey was successively an advertising, publicity and newspaper man, and this particular training naturally taught him just how and when a particular kind of advertising should be used to obtain nearly one hundred per cent results.

WHO'S WHO AMONG MAGAZINE ADVERTISING.

This is the second consecutive year that The C. Bell Company and Procter & Gamble Company have the list of advertisers in this country.

Of interest, too, is the fact that both of these companies market what might be termed inexpensive products.

Below are listed the thirty leading advertisers their expenditures in magazines during 1922:

Campbell, Joseph Co.	\$1.3
Procter and Gamble	1.1
Colgate Co.	1.0
Victor Talking Machine Co.	1.0
Palmolive Co.	7
Lever Bros.	6
Congoleum Co.	6
Cudahy Packing Co.	5
Postum Cereal Co.	5
Fels & Co.	5
Pepsodent Co.	5
Quaker Oats Co.	5
Swift & Co.	4
Fleischmann Co.	4
Jergens, Andrew Co.	4
Goodyear Tire & Rubber Co.	4
Cacuum Oil Co.	4
Northwestern Yeast Co.	4
Hudson-Essex Motor Car Co.	4
Watkins, R. L., Co.	4
American Radiator Co.	4
Maxwell-Chalmers Motor Car Co.	4
Liggett & Myers	4
General Electric Co.	4
Eastman Kodak Co.	4
United States Tire & Rubber Co.	4
Firestone Tire & Rubber Co.	4
Genesee Pure Food Co.	4
Bon Ami Co.	4
Southern Cotton Oil Trad. Co.	4

BRITISH TAKING TO ICE CREAM.

The American consul in London reports that the British are taking to ice cream and that the consumption this year increased 1,000 per cent. Perhaps the climate that has made the English, heretofore responsive to the appeal of ices but, having seen taste, like Oliver Twist, they want more. It is that grows, as is attested by the great increase in the manufacture of ice cream in this country. What many years ago there was one place dispensing ice cream and the various concoctions into which it entered seem to be a dozen now. They must thrive or not exist in such numbers. In the aggregate it is the ice cream industry and increases year by year. Possibly some recent legislation may have had an effect in stimulating the business, though it would seem able to stand on its merits, if we may judge from the manner in which it is sold in all classes, youthful and mature, wealthy and poor, and in its various forms.

Ice cream well illustrates how new industries grow to mammoth proportions. What is at first in the nature of a luxury becomes in time something of every-day consumption. It may be a not indispensable article but millions deem it desirable or it would not be so chasable on every hand. In delaying their appreciation the British have lost much that they might have gained but once learning its merits possibly they will make up for the omission.—Pittsburgh Gazette-Times

GETTING WISE.

On the eve of the exposition The Association of Ice Cream Supplymen issued an illustrated little folder with wise and snappy verses that we are passing on to our readers interested in the exposition, which includes about everybody:

There was a man in our town
And he was wondrous wise

BUT

When he reached the Cleveland Show
It opened both his eyes!

For there he saw machinery
Of every use and size

And there he viewed equipment
That answered "How's" and "Why's"

He saw among two hundred booths
A regiment of supplies

He learned from service experts
New profit "Noes" and "Ayes"

And when he left the Ice Cream Show
He said "Now I am WISE."

ASKANS TO MAKE CONVENTION PLANS.

Meeting to form plans for the next annual convention of the Nebraska Ice Cream Manufacturers' Association is to be called some time in October, as announced recently by Secretary C. W. McGinnis. The meeting will be in the nature of "a fall and winter camp" to work out matters that have been pending some time, in addition to laying convention plans, Secretary says. The officers and board of directors will meet at the end.

Address

The 23rd Annual Convention

OF THE National Association of Ice Cream Mfrs.

WILL BE HELD AT

CLEVELAND, OHIO
CLEVELAND HOTEL

October 22-22-24-25, 1923

All indications point to the fact that our next Annual Convention to be held in conjunction with the Second Annual Exposition of the Association of Ice Cream Supply Men, will bring to Cleveland the largest gathering of Ice Cream Manufacturers ever held in any one city in the country.

An attractive program of subjects of great benefit to all Ice Cream Manufacturers, is being prepared.

The following are a few of the addresses to be delivered:—

The "Motor Delivery Problem"—a symposium by four speakers.

"A Service Charge for Icing Cabinets"—another symposium by four speakers.

"Edible Gelatine" (illustrated by Lantern Slides.)

"Some Troubles of the Smaller Manufacturer."

"Spread in Cost between Brick and Bulk Ice Cream," etc. Also Committee Reports on Uniform Cost Accounting.

Standardization of Equipment.

Express Rates.

Standards and other subjects in which you are highly interested.

Copy of complete program will be sent you very shortly.

The Entertainment Features this year will surpass any heretofore given. Hostesses will look after the comfort of the ladies who will be elaborately entertained during the entire period of the Convention.

In addition to the foregoing, you will be able to inspect the most complete and latest types of ice cream manufacturing machinery, equipment and supplies. Furthermore, the opportunities afforded of mixing with your fellow manufacturers and discussing with them the various problems with which you might have to con-

tend and possibly learning their solution, are unparalleled.

Special railroad rates of fare and one-half for the round trip on the certificate plan, have been granted. Full details later.

A limited number of double and larger rooms are still available for Ice Cream Manufacturers, at the Cleveland Hotel, where all sessions of the Convention will be held. Make your reservations at once, specifying time of arrival and number of people to occupy rooms.

Come to Cleveland the week of October 22nd, 1923. Bring your fellow ice cream manufacturers with you and help to make up the 4,000 people who will attend this Convention and Exposition.

C. G. MORRIS,
President.

N. LOEWENSTEIN,
Secretary.

AND ADVERTISING PLAN FOR ICE CREAM.

der to advertise and sell with efficiency and it is necessary to have a plan. Probably no manufacturer's selling problem is quite the any other, but the plan outlined will serve as a r it has the merit of being elastic. A large urer would probably require an experienced ead each division with one or more assistants. l company on the other hand might put all of e in the hands of one man. It is important, that the sales end of the business be left to e of a man who is not connected with the oper- l, or the latter will demand the lion's share of and the sales be thereby hampered.

der to put the plan into operation, it is neces- ave an appropriation and to allocate a proper on of it to each division. Most concerns figure i percentage of expected sales, usually about 5 for advertising and 15 to 20 per cent for selling. method outlined contemplates practically every orm of publicity that will promote the sales of n. One form will reach one class of prospect ther will reach another class. Some ice cream turers favor one method of advertising and vor another because their favorite has proven ductive for them.

wiser for the small manufacturer to confine his o one or two mediums and do intensive work mediums than it would be to scatter his appro- thinly over all possible mediums. For the medium is used the more easily and abundantly ices. A salesman seldom makes a sale of any i the first call but the longer he calls on a cus- he larger share of business he secures and the e gets it.

the following plan in its entirety should be fol- y the manufacturer of large capacity who wants all of the business possible in his community. all manufacturer should adopt the mediums he rd to use and cultivate them intensively, branch- as his business and resources permit.—From "Advertising Ice Cream" by N. C. Tompkins.

WICK LEADS OKLAHOMA WOLFHOUSES.

e President C. H. DeRoche has given up his with the Oklahoma Wolfhouses to leave the ice ndustry, it has fallen upon C. R. Hauck, vice- at, to take the lead in preparations for the con- of that organization and the Oklahoma Asso- of Ice Cream Manufacturers. He is being as- by Secretary Otis B. Witte.

CLEVELAND WANTS TO BE ICE CREAM HEADQUARTERS.

at Cleveland interests want to induce the two ice national associations to establish their head- ts in that city is indicated by press reports from nd.

recent issue of a Cleveland newspaper appeared indicating that local convention officials would a move in this direction during the exposition onth. Secretary N. Loewenstein of the National tion of Ice Cream Manufacturers advises The Ice Review that he knows nothing of any such plan. s of The Association of Ice Cream Supplymen e report that no suggestion of this nature has ntertained at their headquarters. Cleveland is of its selection for two successive years as the am exposition city. Officials of that city have me time been seeking to make arrangements y their city would be made the permanent scene xposition.

Reduce Bacteria Count

Buy one of these cells—

Put salt water in it.
Turn on current of electricity.
Product is Sodium Hypo-
chlorite.

Cost about 2 cents per gallon.
Keeps down stale milk odors.
Reduces bacteria count.
Bacteria count is the index of
quality.

High quality increases busi-
ness.

Following is a City Bacteriologist's report
on a big ice cream plant using this Hypo-
chlorite freely:

	Bacteria per C. C.
Mix No. 3 Chocolate . . .	3,000
Mix No. 4 . . .	1,000
Vanilla Ice Cream . . .	2,000
Peach Ice Cream . . .	1,000
Strawberry Ice Cream . . .	2,000
Chocolate Ice Cream . . .	4,000
Harlequin Ice Cream . . .	2,000
"Milco" . . .	1,800

Bacteria count for Ice Cream usually
runs into the hundreds of thousands
per C. C. **Why Not Reduce It?**

Write for bulletins.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

Pre-Exposition Trade Notes

We Invited Our Friends the Exhibitors to tell Something About the Products they Will Exhibit, and here is What They Had to Say

Creamery Package Manufacturing Co.

The Creamery Package Manufacturing Company will have an exhibit in spaces 166 and 167 at the national exposition at Cleveland, October 22-27. It will make a feature display of the Progress ammonia or direct expansion freezers and of the Ft. Atkinson and Progress brine freezers in their various sizes. This company in addition will have a comprehensive display of their various types of ice cream can washing and sterilizing equipment.

The exhibit will be in charge of E. F. Wellinghoff, director of sales, assisted by the following members of the CP staff: G. E. Wallis, manager of Boston sales branch; G. G. Donohue, manager of Philadelphia sales branch; C. A. Wiltsee, manager of Jersey City sales branch; J. D. Burnap, manager of Toledo sales branch; R. D. Britten, manager of Pittsburgh sales branch; B. F. Newton, manager of Buffalo sales branch and A. E. Greenwood, manager of Atlanta sales branch.

In addition to the above, the company will have several representatives present from the factories and the entire Eastern and Southern sales staffs. Visitors are cordially invited by officials of the company to make this booth their headquarters during the show.

EXPOSITION BOOTHS SOLD OUT.

Just before this issue went to press, The Ice Cream Review was advised by Roberts Everett, secretary-manager of The Association of Ice Cream Suppliers that no more exposition space is available for non-members of the association, unless some regular members, for some reason, fail to take space reserved. Space already has been denied many non-members, and there is a long waiting list for what space may be available at the opening of the show, we are advised.

Corrizo Extract Company.

This company will exhibit in booth No. 3 and will be represented by: J. Oscar Nunes (in charge) 492 Convent Ave., New York City; C. H. Parsons, 120 Welles Avenue, Boston, Mass.; K. P. Nauert, 442 Allenhurst Ave., Ridgeway, Pa.; and E. C. Krueger, 6009 Calumet Avenue, Chicago, Ill.

The McLaren Products Co.

Representatives who will attend the convention are: U. A. Kreidler, sales manager; J. W. Hill, R. S. McFarland, Laurence F. Flood, John J. Helbling and J. L. O'Keefe. The exhibit will consist of a display of McLaren's "Real Cake" (double-ring) ice cream cones.

The Daigger Corp.

This company will exhibit Washburn's ice cream improver—A material used to quickly increase the viscosity of the mix, insuring a smoother, more uniform, better-bodied and richer tasting ice cream, and permitting of obtaining a maximum yield without the sacrifice of quality, according to the company's claims. There also will be exhibited Washburn's chocolate concentrate—a concentrated chocolate flavoring for ice cream, prepared for immediate use; Washburn's vanilla concentrate—a concentrated vanilla compound; Survivors—cardboard ice cream cone carriers. The survivor accommodates five ice cream cones and is imprinted with the advertisement of the ice cream manufacturer; Survivor fountain stands—all-metal, white enameled stands manufactured especially for the prominent and permanent display of survivors. These will be found in booth No. 136.

Merrell-Soule Co.

The Merrell-Soule Company announces that it is a healthy bit of fun to its Cleveland exhibit. The year ice cream manufacturers have noted the the White Elephant, "Liquid Milk," in the Merrell-Soule advertisements. The announcement in the Exposition finds them offering to teach ice cream men how to handle these plans. He says there will be a big crowd come for all at Booth 58.

Crystal Gelatine Co.

Representatives of the Crystal Gelatine Company will be at the national exposition are: E. C. Wright, president; G. W. Gethro, assistant to sales manager; Owen, J. C. Richardson, O. C. Horn, L. N. Hostetler, Drew, C. B. Morrow and G. E. Breckenridge.

C. E. Rogers.

This company announces that "the whole gang is there"—C. E. Rogers, C. A. Rogers, E. D. Rogers and J. Rogers. They extend a cordial invitation for many to visit their booth.

Citrus Products Co.

This company will exhibit the entire line of "Electric" flavors. The booth will be No. 44, in charge of C. J. Pohl, assisted by J. P. Sowards and J. W. Sheridan. They have arranged to have samples of ice cream, ices and made up of the various flavors to "demonstrate the quality and pleasing flavor." This booth also will display our compounds uniquely displayed in glass, illuminated electric lights.

David Michael & Co.

This booth, No. 62, will be devoted entirely to the exhibiting of Michael's Mexican vanilla powder. The booth is on the lower floor. The company will be represented by: David Michael, Eli Rosenbaum, Robert Rosenbaum, Henry Cox, Henry Mann and Walter Roskam. These will exhibit Michael's gums and extracts.

The J. O. Whitten Co.

This company will exhibit its food gelatine. Representatives are: S. E. Perkins, Boston; T. O. Miller, and H. L. Haas, New York City. The company is located at Winchester, Mass.

Jensen Creamery Machinery Co.

The equipment to be shown at the exposition includes: one 550 gallon square vertical lined, motor driven ice cream batch mixer; one Jensen standard circulating unit; one Universal homogenizer; a driven sanitary milk pump; one belt driven sanitary pump and one 20x36 double surface pre-heater. It contains the company's usual line with the addition of special units, namely, the double surface pre-heater machine is a decided step in advance over the old of pre-heating in the hotwell, official claim. They do away with the addition of steam direct to the thereby eliminating any possibility of re-contaminating through boiler scale and compound. The other special to be shown, the universal homogenizer, is a combination of two old line machines now on the market. It embodies several new principles and improved operation, officials say.

The following men will be in charge of the exhibit: G. Cornell, Jr., treasurer and general manager; McCandless, sales representative; J. B. Addison, secretary.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

SEE IT AT THE ICE CREAM SHOW

The Junior Viscolizer

*Improves
Quality.
Saves Waste*

*Capacity
Fifty Gallons
Per Hour*

A NEW size Viscolizer designed especially to fill the needs of the smaller dairies and ice cream plants. Its comparatively low capacity and economical operation make it particularly adaptable to the small ice cream manufacturer or to the neighborhood creamery competing with large concerns on a quality basis. Though intended especially to provide Viscolizer service for even the smallest operator, the Junior size also lends itself to a multitude of special uses in a plant of any capacity.

THE NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

sentative; F. A. Lowery, sales representative, and O. B. Foote, Jr., sales representative.

* * *

The National Paint and Varnish Co.

This company will exhibit its Derycote tub and can enamel, manufactured for ice cream tubs and cans; its Derycote interior wall paint, made in both flat and gloss for the painting of the walls of an ice cream plant or dairy; its Derycote cabinet stains for the refinishing of ice cream cabinets. A. E. Brookes, A. W. Miller and F. M. Baird, sales manager, will represent the company.

* * *

John J. Grothe Co., Inc.

This company, which is located at Woburn, Mass., will be in booths Nos. 183, 184, 185 and 186. Officials say they will have on hand at least one Zero refrigerator body with all the latest improvements, also on new Zero store cabinet, which they believe, is "a revelation" in this particular line. It is possible for one man to place it into a store. It is claimed to take less ice and officials say it will not absorb as much moisture as a cork insulated cabinet. The firm also will exhibit a new metal container for the handling of package ice cream in the hardening rooms.

The following representatives will attend: J. N. Curdy, president; A. B. Mackay, vice-president and general manager; J. E. Burke, Jr., treasurer; Frank L. Ruzicka, representing our St. Louis branch; M. T. Gardner, representing our Cleveland branch; John Mitchell, representing our Canadian branch; H. J. Schayer, Sr., representing Southern branch; C. A. Epperson or G. Hart, representing western branch. Also salesmen from the home office: Joseph Robbins, Charles Cronin, David Dobson and Ralph Lucas.

* * *

Essex Gelatine Company.

This firm will occupy booth No. 143. There will be present: L. B. Esmond, manager; H. M. Colman, R. E. MacFarland, Stanley Casler, R. C. Lawrence, John J. Treacy, and E. B. Richardson. This company manufactures edible gelatine of the "finest manufacture and quality." It has warehouses at Boston, New York, Philadelphia, Chicago, St. Louis and San Francisco; and in addition, this fall it expects to open warehouses at Atlanta, Ga., Los Angeles, Cal., and Portland, Ore. The requirements of the ice cream manufacturer are becoming more and more exacting as to the fineness of the gelatine they use in their product, and "by constant improved methods of the most exacting character, we have kept a step ahead the twenty years we have been in business," Manager Esmond says.

* * *

John W. Ladd Co.

This firm's booth is No. 164. It will have on exhibition its cut-away viscolizer as well as several standard machines, including the new Junior machine which is being exhibited for the first time. The company also will exhibit the Rogers brick maker in two sizes, the Junior being a new machine at a very popular price. In this booth will be: A. Drysdale, R. J. Ellmanger, N. J. Kestner, D. G. Kercher, H. A. Drennan, G. W. Rohrbeck, C. A. Grove, M. Conaton, Jr., E. C. Hanna, B. C. Stroud, R. R. Cundall, C. B. Hood, R. G. Gay, H. S. Mesloh, H. B. Sherman, J. A. Hamilton, A. Anthony, L. T. Moore, W. H. Petty and R. Strachan.

* * *

Harold A. Sinclair.

This company will have samples of gelatine on display at the Cleveland exposition. The names of its representatives that will attend are: Frank Coburn, Frank Z. Woods, Howland H. Sinclair and George Woods. The number of the booth is 41.

* * *

Smith & Mann.

This company will be represented at Cleveland by James A. Smith. It will occupy booth No. 154. The company is located at Philadelphia. It supplies the Smith & Mann one-piece valve for ice cream cabinets. It is claimed that this valve can not leak. The seam is cast in one continuous piece to fit the width of the insulated cabinet wall, the company says.

* * *

A. H. Barber-Goodhue Co.

A. H. Barber-Goodhue Company, 300 W. Austin Ave., Chicago, offer among all other requirements for the dairy trade, a viscolizer which thoroughly mixes the butterfat in the cream with the sugar, gelatine and other ingredients and resulting in a smooth, rich-feeling ice cream. A fine

quality cream may be developed from sweet butter and milk, or skim milk powder. The viscolizer unites the ingredients so that the butterfat will not separate standing in the can or bottle. It is furnished in motor belt drive—in five sizes, to meet the needs of any large or small, capacities 100 gallons to 800 gallons per hour.

* * *

Cincinnati Extract Works.

One of the attractive displays for the Cleveland exposition is that being arranged by The Cincinnati Extract Works. Those who will come from Cincinnati to represent the will be Emil I. Mayer, Alvin J. Lewis and C. P. Guiniv.

* * *

Consumers' Gelatine Co.

As usual, many of the ice cream trade will be glad to see the genial representatives of the Consumers Gelatine Co. of St. Louis at the Cleveland show and fall conventions.

* * *

United Cork Companies.

This company makes the tempore food box, a product designed to preserve and transport ice cream and Eskimo. It is said to be neat, light, handy, efficient and sanitary being made of cork. The company will exhibit at Cleveland. In its booth will be C. L. Parham, Cleveland district manager; E. H. Bartsch, assistant manager of that district and C. Johnson and C. R. Hibbard of the Cleveland office.

* * *

Wolf & Lavenson.

This company will exhibit its attractive window display and cut-outs for ice cream manufacturers to use in promoting retail sales. Its handsome products will be exhibited by: Frank Wolfe, Frank Jones, Fred Simon, N. Fraustein, Sidney Rice and Isadore Dressler. Mr. Jones reports heavy sales of these products following a recent trip through the middle western states. He is well known to ice cream manufacturers in that territory.

* * *

Rice & Adams.

This company will be represented at Cleveland by president, Charles S. Adams; W. C. Stephens, vice president; Orlando Adams, treasurer and general manager; G. I. Faden, W. E. Prescott and Frank Wolff.

* * *

Pfaudler Co.

The Pfaudler Co. will occupy booths Nos. 98 and 99. It will exhibit its glass enameled steel products. The company will be represented by P. S. Barnes, William E. H. S. Tvedt, I. C. Douglass, W. H. Klee, George M. George E. Gray, J. G. Moore, E. D. Bennett, A. J. Edwards, J. H. Davis, F. J. Bresnan, H. W. Pettengill, E. G. W. D. Pheteplice, H. A. Stuart, I. E. Colvin, R. B. Krag, D. E. Rusishauser, C. J. Portre and C. T. W.

* * *

Atlantic Gelatine Co.

The Atlantic Gelatine Co. will be represented at Cleveland by J. H. Cohen, vice-president, and David Cock, general sales manager. The home office of the company is at Woburn, Mass. Atlantic, super-clarified gelatine will be exhibited. Ice cream manufacturers are invited to visit this booth by Mr. Babcock. Other representatives will be J. A. Williams, W. H. Jose, M. G. Bardwell, C. S. A. F. Vyse, Geo. B. Woodward, W. T. Turner and Burges.

* * *

Taylor Instrument Companies.

This company will exhibit a complete line of industrial and recording thermometers, recording pressure and temperature regulators, dairy thermometers and meters, for all applications in the ice cream industry. These instruments will be included the following: recording index and industrial thermometers for ice cream factories, recording, index and industrial thermometers for pasteurizing holding tanks, pipe lines, coolers, hardening rooms, etc. The company will also feature recording, index and industrial thermometers and temperature controls for refrigeration plants.

The exhibit will be in charge of J. W. Schwartz, assisted by C. B. Carson. There will also be in attendance Herbert Mauer, Jr., manager of the Cleveland office, and Gaeckle of the Cleveland office.

* * *

Armstrong Cork & Insulation Company.

This company's space at the ice cream exhibit, Cleveland is number 74. It will exhibit Nonpareil corkboard for insulation of cold storage rooms, Nonpareil cork covering brine and ammonia lines, Nonpareil high pressure cork

THE NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

time and is constantly adding to its list representative ice cream manufacturers throughout the country, officials say. Our cocoa is strictly a high-class product and wherever used has given the ice cream manufacturers most wonderful results.

The founder of the firm of C. J. Van Houten & Zoon, C. J. Van Houten, was the inventor of Dutch cocoa—in fact, the inventor of cocoa powder—and the firm for nearly one hundred years has enjoyed the reputation of being pioneers in their line, according to officials.

Milligan & Higgins Gelatine Company.

This company's display at the exposition will consist of samples of granulated gelatines.

The representatives will be: Frank L. Carroll, Thos. J. Stewart, Charles Blake, A. W. Johnson, H. T. Hall, sales manager.

John Wood Manufacturing Co.

This company will have booths Nos. 4 and 5. Its exhibit will be practically confined to ice cream cans and equipment closely related to it.

Foxboro Co.

The Foxboro Company, Inc., will exhibit indicating and recording gauges and thermometers which are specially adapted for use in the ice cream industry, as well as a number of their standard power house and refrigerating plant instruments. Of particular interest will be the automatic temperature recorder-controller which will be in actual operation. This instrument not only controls the temperature used in such operation as pasteurizing but furnishes an accurate record of the complete operation.

International Co.

The International Co. will be represented at Cleveland by D. L. Beal and N. R. McVeigh. The company will exhibit flavors. C. M. Pitt is president.

Bessire & Co.

Bessire & Company is a rapidly growing firm with factories at Indianapolis, Memphis, Louisville, and Atlanta. They offer to the trade a very fine quality of tools, machinery and supplies for the ice cream maker and fountain service.

SANI-DAIRY PRODUCTS CORP.

This company will be represented at the exposition by Henry W. Sterne and others. These representatives will explain to manufacturers the company's simplified system of making and marketing "Goody-good." The company claims that ice cream manufacturers in more than 300 cities are getting five gallons more business every day from each store on its product.

RIGHTER MANUFACTURING CO.

Louis A. Linz, president of the company, will have charge of this booth. He will be assisted by Joseph J. Werner. The company will exhibit vanilla extracts. The company has been making vanilla for 20 years. They claim to offer service, quality and "the right price." The company is located at 136 Provost St., Jersey City, N. J.

Rex Extract Co.

The Rex Extract Co. will exhibit Caramala and Mexocine. Mr. Beall will be in this booth. The company is located at 257 Pacific St., Brooklyn. Mexocine is claimed to be a high-grade concentrate, a combined bean vanilla, vanillin, coumarin and tonka flavors. Officials say it is impossible to freeze out its true flavor.

Oakes & Burger.

O-B triangular packers will be exhibited at the exposition by this firm, which is located at Cattaraugus, N. Y. The company claims that through the use of these packers much labor and space can be saved.

Sanitary Tinning & Mfg. Co.

This company will be represented at Cleveland by A. J. Miller and O. C. Miller. It is located at Cleveland. Old, worn-out cans are made to look like new, they claim. Manufacturers are invited to visit this booth and to visit their place of business in Cleveland, at 3753 E. p3d St.

William F. Baird Co.

This company, located at Woburn, Mass., will booth 148 at the exhibition and will be represented by and Mrs. William F. Baird, Bart W. Baird and Al Warwick. The exhibit will consist of one or more motor bodies in operation.

Richmond Cedar Works.

This company, located at Richmond, Va., will space No. 91 at the Cleveland exhibit, and expects the following representatives on hand in its booth: George Mortland, John S. Parrish, H. C. Parrish and Marshall. The company will exhibit its regular line of ice creaming tubs, ice carry pails and ice pails.

John H. Mulholland Co.

Representatives of this company, located at Philadelphia, will be: John H. Mulholland, Harry H. Mulholland and Howard W. Black.

Sealright Co., Inc.

Sealright containers for ice cream will be exhibited by Wilbur L. Wright, vice-president and general manager. The company will be in charge of these booths—Nos. 36.

Cherry, Bassett, Winner Co.

N. M. Thomas, manager of the ice cream division, in charge of this exhibit. Messrs. Winner and Mr. Bassett be present, as also C. G. Chappell, Pittsburgh division manager and H. D. Green, New York City, division manager.

Hudson Manufacturing Co.

This company will occupy booths Nos. 138, 139, 159 at the National Ice Cream Exposition. The company extends a cordial invitation to manufacturers to visit its booths and make them their headquarters while in the show. The company claims that it never has missed exhibiting at an ice cream show, and its exhibit at this month also kept its record unbroken for exhibiting at the dairy show. In the Hudson booth will be President Wegener, W. S. Rector, Miss Sally Mahoney, Chris H. C. W. Smith, Gus H. Bulger and John J. Meyer.

Manton-Gaulin Manufacturing Co.

This company will occupy booths Nos. 141 and 142 at the ice cream show. Its 800-gallon homogenizer will be exhibited. Officials extend a hearty invitation for manufacturers to make themselves at home in the booth "and feel free to ask questions." The company is located at Boston, Mass.

S. Gumpert & Co.

In this company's booth will be: A. B. Westerman, W. Stolteben and F. G. Ladd. The company is located in Brooklyn and will exhibit Gumpert's ice cream flavors, textor, vanyl flavoring extracts, fruit emulsions and colors.

Thomas W. Dunn Co.

In this company's booth will be F. E. Hall, F. E. Weg and A. C. Haas. The company is located in New York City. It will exhibit its well-known gelatine—granulated, flake shredded and sheet.

Solar-Sturges Mfg. Co.

Believing that a can with a bum handle is as good as no can at all, the Solar-Sturges Mfg. Co. of Chicago has made great improvements on the handles of their cans, they say. It will pay ice cream manufacturers to visit the Cleveland show to make it a point to visit the Solar-Sturges exhibit and learn just why the handles on their cans can give such good service. Mr. Camille Sturges, Chicago office, sales manager of the company, will be in charge of the exhibit.

Swift & Co.

A more sociable bunch of fellows than the Swift gelatine salesmen is mighty hard to find. When at the Cleveland exhibition, drop into booth No. 65 and introduce yourself. You'll soon feel at home, and incidentally, they may tell you about the way the Swift product is made. You'll be welcome, we're sure.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

Baird Refrigerator Bodies

Improvements in Baird Refrigerator Bodies for 1924:

Welded Seams, re-galvanized after welding.
Drain Pipes welded in place.
Thicker Metal Linings throughout.
Better and Stouter Hardware.
Lighter and Stronger Hatch Covers.
Thick Metal Plates on all wearing surfaces.
Indestructible Door Mouldings.

BARBER

Everything for the Dairy Industry

Ice Cream Men: See The Barber-Goodhue Exhibit at Cleveland—

You will be particularly interested in a practical demonstration of the three products illustrated on this page—products that are making history in the progress of the ice cream industry.

Improved U. S. Heavy Duty Brine Freezer

If you believe in the economy of good equipment it will be merely a question of time until the U. S. Heavy Duty Brine Freezer is standard equipment in your plant—the freezer that through sheer merit has won a place of indisputable leadership. Equipped with every modern device for the saving of time and labor and for the improvement of its product.

Titan Separator

The largest capacity, therefore the speediest, separator made. A single Titan will replace two or three smaller machines, with a profitable saving in time and up-keep expense. Guaranteed to skim to .01 of 1% by the Babcock Test—the only separator you can buy that is backed by such a guarantee.

The Viscolizer

gives you a smoother, richer feeling cream by finely dividing the butterfat and allowing it to unite inseparably with the filler, the sugar and the gelatine. Gives you a fine quality of cream from sweet butter, skim milk, or skim-milk powder. Furnished for either motor or belt drive.

We are also Distributors for the Complete Line of Elyria Glass Lined Tanks. One of These Tanks Will be shown in our Cleveland Exhibit.

THE NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

Commercial Truck Co.

In the Commercial Truck Company's booth will be E. J. Hancock and C. W. Peck. Manufacturers are invited to visit this booth.

H. S. B. W. Cochrane.

The "Creasey" family of ice breakers, we are told, will attend the Cleveland show in person under the guardianship of The H. S. B. W. Cochrane Corporation, Philadelphia.

AUSTIN CO.

As constructing engineers who have won a national reputation for achievement by way of speed, practicability and immensity of the undertaking The Austin Company of Cleveland, Ohio, have a long record of accomplishment. Many are the results of their efforts that can be pointed to at Cleveland while at the National Ice Cream Show.

AYER & McKINNEY.

"Yes, we have no Bananas," may have done wonders for the United Fruit Co. and the sale of the elongated tropical fruit, but "We have the right kind of milk powder and condensed" is a popular expression conveyed by Ayer & McKinney of Philadelphia, who say they know what the ice cream trade needs in these products.

BEACON MFG. & SALES CO.

The signs of the times in the ice cream business will be on display at the Cleveland Ice Cream Show in the booth of the Beacon Mfg. & Sales Co. of Freeport, New York. They make a distinctive line of signs for the ice cream trade.

BOERNER-FREY CO.

Friends of the "Poodle-Dog State" will no doubt be accorded the usual pleasure at the ice cream show of meeting representatives of the Boerner-Frey Co., Iowa City, Iowa. Their flavors for the ice cream trade are growing in prominence each year.

Grand Rapids Cabinet Co.

Visitors to the Cleveland Ice Cream Exposition will be sure to find interest in the exhibit by the Grand Rapids Cabinet Co. of Grand Rapids, Mich. Hailing from the city of good furniture this concern never fails to exhibit a line representative of the good traditions of that city.

Crown Fruit & Extract Co.

Under the guidance of the versatile "Pete" Miller the Crown Fruit & Extract Co. of New York will find their exhibit at the Cleveland Show unusually busy this year and abounding in more than business congratulations for Mr. Miller.

Cream Production Co.

Condensing the surplus milk and cream for small plants is a problem the Cream Production Co. of Port Huron, Mich., has solved in a practical way with their special equipment. The genial Mr. Ruff, who is the inventor of this equipment on a new principle, is usually present at all leading conventions and the Cleveland registrations would hardly be complete without him.

Keystone Fruit Products Co.

Keystone Fruit Products Company of Cincinnati, Ohio, will have a line of fruits and syrups at Cleveland. Al. Isaacs, M. H. Hall, Frank C. Wagner and M. B. Abrahams will be the representative present, and if you don't have the treat of your life by tasting a sundae topped with some of their fruits, you 4,000 visitors to the show, it's your own funeral.

Chas. A. Berger.

The October issue of The Ice Cream Review carried an article about the new Ives Ice Cream plant in Minneapolis. This is one of the finest, and the newest large plant in the Northwest. The views of the interior of the plant, and the floor plans, which were reproduced in the October issue, reveal to the ice cream manufacturer that the plant was carefully planned to eliminate handling of materials, unnecessary labor, etc., just as much as possible. This plant was designed by Chas. A. Berger, refrigerating engineer and

architect, 401 Phoenix Bldg., Minneapolis. Other plants signed by Mr. Berger are the Crescent Creamery Co., Minnesota Milk Co. of St. Paul; the Kemps Ice Cream, Hayes Ice Cream Co., and Metropolitan Milk Co. of Minneapolis; the Flynn Dairy Co., Des Moines; the Wat Creamery Co., Omaha, and the Skoug Candy Co., Sioux Falls, S. D.

D. A. Matot.

D. A. Matot of Chicago will be at booths Nos. 180 and 181 at the Cleveland show. A full line of attractive cabinets will be displayed and shown interested visitors by D. A. Matot, E. J. Matot and W. J. Kreiter. Aviator Mac may be trying for a new altitude record, and coal may be used to do the same, but the Matots intend to break a record by showing a record breaking cabinet.

Walt's Welding Works.

You gentlemen of the ice cream industry who have come from the ranks, and who now come to the office only with your golf equipment, remember the time when you began that little wooden building on Main Street. You used to tote ice cream tubs weighing 150 pounds around all day long, and let the good wife put a mustard plaster on your back at night. Them days is gone forever, for there is a little change now with two wheels and a pair of hands that picks up the ice cream tubs, lifts them gently, moves them quietly to the place you want them, and gently places them on the floor, no scraping of tubs on the floor, ruining the bottom of the holes dug in your good floors. This truck is being made by Walt's Welding Works of Pendleton, Oregon, and will be demonstrated at the Cleveland convention.

Thompson-Bremer Co.

"Tell the ice cream men we will take the kinks out of their kinky kanks," says a representative of the Thompson-Bremer Co. of 1750 Carroll Ave., Chicago. This company are now distributing the "Electric Weld" can made by John Wood Mfg. Co., also other supplies for ice cream and milk plants. They make a specialty of doing high retinning work.

William Timm.

To build or not to build, is a question to be decided by the ice cream manufacturer himself. But "how to build" is a question that requires the minds of men who have made a specialty of the business of building ice cream plants. Wm. H. Timm, engineer and architect of Philadelphia, since ice cream has been made in modern plants and with modern machine methods, made a specialty of designing cream plants that require the minimum of labor and cost to produce ice cream at the lowest possible cost. Mr. Timm's organization can render valuable service to anyone considering the construction of a new ice cream or dairy plant. This is claimed.

U. S. Freezer & Machine Corp.

Visitors at the National Dairy Exposition were made thus over the new U. S. Heavy Duty Freezer, made by U. S. Freezer & Machine Corp. of Brooklyn, N. Y. The machine has many features about this machine which make it a desirable freezer to have in your plant when the best is desired in a limited time.

U. S. Gelatine Co.

In the days—BP—Milwaukee was noted for the manufacture of a certain kind of beverage, unmentionable. Now, to ice cream manufacturers especially, it is known as the home of The Ice Cream Review and the United States Gelatine Company. In Carrollville, just beyond the limits of Milwaukee, is one of the city's finest manufacturing plants, where "U. S. Gel" is made. U. S. Gel will be exhibited from booths No's. 173 and 192 at the Cleveland exhibition. When you are there, give our Milwaukee friends a call.

Zipp Manufacturing Co.

The Zipp Manufacturing Company, Cleveland, manufacturers of extracts and crushed fruits for ice cream manufacturers, will have their exhibit at booth No. 182 at the Cleveland exposition. The company announces that its salesmen will be there to meet the trade. Manufacturers are welcomed to make the Zipp booth their headquarters. C. J. Yuncker, president of the Michigan Dairy Producers Association, will be in the Zipp booth to meet his trade, and in the evenings at the Winton Hotel, where he will be registered. Zipp salesmen will be at Winton Hotel.

Sealright *Liquid Tight* Paper Containers

BUILD Year-Round, Volume Sales
with these

POPULAR SEALRIGHT PACKAGES OF YOUR ICE CREAM

SEALRIGHT SUNDAE SIZE

Build bigger ice cream sales with this real selling feature—your ice cream packaged in Sealright $\frac{1}{4}$ pint Sundae Size Containers. Top of cream may be coated with any popular flavor or fruit dressing. A sturdy slip cover permits hardening up-side-down, so as to keep flavoring where it belongs. This ready-to-serve sundae makes a hit with dealers because it sells fast, serves fast and pleases customers. Many people buy them by the dozen for parties, etc. Many dealers retail them for 10c.

SEALRIGHT $\frac{1}{4}$ PINT, FLAT

Get \$1.60 for your ice cream packaged in Sealright $\frac{1}{4}$ pint Containers (flat size). Places your ice cream on the same rapid, profitable selling basis as chocolate bars, or any other "buy it and carry it away with you" commodity. Especially salable in public places where many people must be served quickly. When sold for 10c, with a paper spoon clipped under the crimp on the cover, a tremendous sales volume is possible.

SEALRIGHT $\frac{1}{2}$ PINT SIZE

Build and assure a year-round, carry-home business by packaging your ice cream in Sealright $\frac{1}{2}$ pint Containers. Sells to consumers for 15c, a popular price—a price within the reach of all. Here is a real chance to build up your plain flavor business, and create a tremendous sales volume for popular priced ice cream. Both manufacturer and dealer make a nice profit. The price, plus the size, places your product within the reach of multitudes. Remember, more people have 15c to spend for a carry-home package of ice cream than 30 or 60 cents.

Sealright containers may be filled direct from freezer,
or by Sealright Ice Cream Filling Machines

Write for samples of these popular Sealright sizes. Also for booklet BIGGER ICE CREAM SALES, and samples of Sealright window pasters, transparency, and other free advertising tie-up material that helps you cash in on Sealright national advertising in The Saturday Evening Post and Good House-keeping.

THE NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

Jensen Creamery Machinery Co.

This firm will exhibit its vertical coil square pasteurizer at Syracuse. Ice cream manufacturers are invited to visit this booth and ask questions concerning "equipment of practical efficiency." Representatives will be on hand to explain anything visitors wish to ask, it is announced.

* * *

K. W. Schantz, Inc.

There is many a monument to the memory of the work of the firm of K. W. Schantz, Inc., Buffalo, N. Y., and the interesting part of it is these monuments are serving their owners most efficiently in the production of ice cream. K. W. Schantz, Inc., have for many years been specializing in the construction of ice cream and dairy plants. Their plans should be requested before a new plant is constructed. They will be represented at the Cleveland show.

* * *

Cincinnati Extract Works.

Yes, sir, when you are in Cleveland you must meet Mr. Emil I. Mayer, the president of the Cincinnati Extract Works, Cincinnati, or one of his representatives, and obtain samples of the well known "Reyam" brand products for ice cream. The Cincinnati Extract Works are offering fruit custard, orange pineapple, tutti frutti mixture, chopped walnuts in maple, crushed peach and apricot and cherries that will help considerably to boost your winter sales.

* * *

Hughes Gelatine Co.

Visit the Hughes Gelatine Company booth while in Cleveland at the convention and you'll find your old friends Lloyd L. Hughes, president; Charles H. Dunn, secretary; and Harry Selonke all there and a royal welcome awaits you. The company has headquarters in Detroit.

* * *

Manning Manufacturing Co.

The Manning Manufacturing Company of Rutland, Vermont, will be at Cleveland at the exposition with their line of cans, washers and mixers. R. A. Manning, G. W. Hammond, K. F. Stebbins, K. E. Webb, F. A. Rice and John Washburn will be the representatives present and when the news floats out from the Manning booth of what is going on at the convention, broadcasted by the radio, it will sound like a few noisy murders.

* * *

H. H. Miller, Industries.

H. H. Miller Industries from Canton, Ohio, will have their ice cream freezers all lined up like silent sentinels at the Cleveland show and the genial faces of the old bunch will grace the booth.

* * *

Allman Gas Engine & Machine Co.

R. J. Decy—you know, "The Old Dog with the New Bark" and oh yes, "The Cat's Meow"—will be in the Allman Gas Engine & Machine Company booth at Number 1 and 2, where Champion equipment will be displayed. Others in the booth will be "Sandy" McDougal and Frank A. Martin.

* * *

Homer Mfg. Co.

The Homer Manufacturing Company of Homer City, Pa., will be at Booth 72 to greet friends and make new acquaintances at Cleveland. The booth will be lit up by the usual headlight—"Red" Burns, the assistant sales manager who is a good dynamo in more ways than one. The Homer ice cream cabinets and packing tubs will be displayed. Other representatives will be J. L. Nix, president; C. K. Sutton, vice-president; M. F. Hasinger, credit manager; H. E. Kerr, superintendent.

* * *

Anheuser-Busch Co.

"Gone are the days" when Anheuser-Busch meant something different than builders of high-class refrigerating truck bodies for ice cream manufacturers. Their immense facilities and long practical experience in wagon building and refrigerating requirements has helped them put out a truck body that will be worth seeing at the Cleveland exhibit. Their home office and plant are at St. Louis, Mo.

* * *

Mojonnier Brothers Company.

Items to be exhibited—Mojonnier milk tester, Mojonnier ice cream overrun tester, Mojonnier ice cream packaging machines (two models,) Mojonnier vacuum condensing unit, Mojonnier culture controller, and several specialties includ-

ing rubber stoppered composite sample bottles, oil butter print scale, milk metal sanitary fittings, book nical Control of Dairy Products."

Special features of Exhibit—A brand new small semi-automatic packaging machine, Model D. T. packaging machines will be shown in operation. Culture controller will be connected up to show electric thermostat controls the temperatures.

People in attendance—P. C. Mojonnier, J. A. Coe Moon, W. W. Hixon, T. Mojonnier and J. J. M plan on spending as much time at the show as possi

McCormick Co.

A booklet entitled "Profitable Building" is ob anyone interested by the McCormick Co., Inc. of P

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

LIKE the Proverbial Acorn, The Olsen Publishing Company has grown to a mighty oak, spreading its many branches of service to all ends of the dairy world.

Its publications, The Milk Dealer, The Ice Cream Review and the Butter, Cheese & Egg Journal have long ago been recognized as leaders in their respective fields. They have maintained their prestige only on account of the service rendered to the dairy industries.

And with the sturdy growth of this business of Service to the Dairy Industries, a mighty printing plant has been developed.

The advertising and printing needs of the dairy industries is a specialized line to which our organization has devoted its entire energies. Profit by commanding our experiences. No obligation to you to submit your advertising and printing requirements for comment and quotation.

The Olsen Publishing Company
5th and Cherry Streets Milwaukee, Wis.

THE NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

and New York City. The long experience of the McCormick Company engineers, specializing in ice cream plants, enables them to furnish more valuable advice on building problems. The booklet is free for the asking. Send for it. McCormick Co. were represented at the National Dairy Exposition, and will have spaces at the Cleveland exposition as well.

New Era Co.

Don't fail to call at booth No. 103 at the exposition and see the newest model of the New Era ice cream brick cutter, manufactured by the New Era Company of Oshkosh, Wis. The New Era cutter has been used since brick ice cream met a ready demand, and the original models have been greatly improved upon, the company says. The New Era cutter is distributed by the most prominent supply houses with branches from coast to coast.

Emery Thompson Freezers.

The latest models of Emery Thompson freezers will also be shown. Mr. Thompson is one of the pioneers in the manufacture of brine freezers, and has always had something of interest to ice cream manufacturers when exposition time rolls around.

Frick Co.

If you are looking for something different in the line of a refrigerator catalogue, write to the Frick Co., Waynesboro, Pa., for regular copies of their "Ice and Frost" booklet by Jack Frost, editor. The booklet is published every little while and is something which serves as an attractive catalogue and house organ at the same time, each individual little booklet covering a different phase of refrigeration as applied to different plants. This well-known refrigeration machinery company turns out equipment suitable for every plant where ice making is necessary, from a show counter to a large ice making plant. For the dairy line, the Frick Co. turns out suitable machinery for dairies, creameries, ice cream plants, storage houses, small ice plants, etc., and the machinery is designed and built to perform its work with a minimum amount of attention and it will last many years.

TRADE LITERATURE.

"Cold Selling Facts" is the title of a book issued by the Eskimo Pie Corporation, Chicago. Among other things, it contains discussions of methods adopted by licensees in manufacturing Eskimo Pies and computing costs, the Eskimo Pie machine, selling the dealer and cold selling facts from licensees.

The Waltham system of ice cream distribution is interestingly described in a folder recently issued by The Housing Company, Waverly, Mass. This company offers what it calls a patented method of refrigeration which eliminates the use of all ice and salt. The method of refrigeration used in the Waltham body differs entirely from all existing principles, it is claimed, the use of cracked ice and salt having been eliminated.

Waltham cabinets, made in from one to four pot sizes, use the same cartridges used to refrigerate the body, being transferred at the time of delivery, officials say.

Trade Notes

Ferguson-Lander Manufacturing Company, 1733 W. Austin Ave., Chicago, are large manufacturers of ice cream cartons, brick boxes, can liners, etc. They have sanitary, well-made products recommended especially for the ice cream manufacturers.

The Electro Chemical Company of Dayton, Ohio, are manufacturing a cell which produces Sodium Hypochlorite. This hypochlorite keeps down stale milk odors and reduces bacteria count. One of these cells is a valuable asset to any ice cream manufacturer.

The first seamless glass-enameled ice cream plant equipment was built and installed by the Elyria Enameled Products Company of Elyria, Ohio, it is claimed. Since then the company has grown rapidly and Elyria equipment can be found in all parts of the United States and in many places in Europe. They are among the largest manufacturers of glass lined equipment in the world.

"Tubs that last" are offered by Philip Spaeter & Philadelphia. These tubs are described as having tubs dovetailed and set in white lead, staves all dowelled, eating shifting; made of select white cedar, with extra hoops.

"Special seal" tub covers are supplied by the S. A. Awning & Tent Co., 800 N. Second St., St. Louis. Officials of the company say their tub covers are of ample size that plenty of lap is provided in all. A double sewing tough thread assures lasting seams, the company says.

Daly Brothers, Schenectady, N. Y., manufacture a handy device whereby tags can be snapped on tubs of ice cream. It is a great saving in the man's time has to tie tags on the tubs and also a saving in the use of strings or wires.

Guesswork is eliminated by the ice cream overruns offered by The Torsion Balance Co., Jersey City, N. J. According to officials of that company. They say their product also assures a uniform product. They claim it to be accurate, rapid, durable and simple.

The Union Fibre Co., Winona, Minn., offers insulation for cold temperatures. Union pipe cover, they say, is only entirely satisfactory covering at a reasonable price cold pipes of every description.

M. R. Carpenter, who for some time past has his headquarters at 72 W. Washington St., Chicago, specializing as architect and refrigerating engineer in the dairy trade.

In a recent court case The Glacifer Co. of 491 Mt. Cambridge, Mass., has won a decision whereby dry ice can be billed at 25 per cent less than actual weight for express shipment. This, no doubt, should prove a big saving for those using their ice less container for express shipping.

When the unexpected happens to the hoops on ice cream tubs, that's when the Gilmour Hoop Machine comes in for a share of praise. As a handy tool for doing a bit of tedious work with ease it is a marvel. And it is a tub that the company claims.

The Union speedway cutter is a product offered by Union Steel Products Co., Albion, Mich. It is described as a simple, accurate and speedy device which makes a dozen ice cream bars an hour, the bars being all alike, with no guesswork involved.

Gold medal ice cream cabinets are supplied by Grandberg, 1441 Sarsfield Place, St. Louis, Mo. Mr. Grandberg says his cabinets are made in all sizes, of the best grade redwood. He claims that they are economical in the use of ice. He asks manufacturers to write for literature.

Announcement has been made by the Virginia Dare Extract Co., Inc., that this firm has purchased the entire flavoring extract department of Garrett & Co., Inc., including trademarks, good-will, etc. The production department will remain under the personal supervision of the President, B. H. Garrett, who created "Virginia Dare" Flavors, and under whose supervision they have been produced since offered to the public. He was for a number of years chief of the United States Food Inspection Laboratory at Boston and has had extensive practical flavoring extract experience, and also served as a member of the Virginia Dare Extract Co. the entire flavoring extract department of the former manufacturers—this department is unchanged in any particular and the superiority of Virginia Dare Products will be strictly maintained, officials say.

Harry C. Hirsch, for many years sales manager of Van Duzer Extract Co., joins the Virginia Dare Company in a similar capacity. W. Frank Hope, treasurer of Garrett & Co., will be treasurer of the new organization, at the same time retaining his connection with Garrett & Co. Tucker will serve as office manager and assistant treasurer. As in the past, its laboratory will be prepared to cooperate with customers who have flavoring problems, officials say. In addition to its double strength household flavors, the

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

will continue to produce extracts, concentrates and is for bulk users and in connection with the sales the company will have practical experts who intimate knowledge of the needs and problems of the baker, confectioner and ice cream manufacturer, who lable as a part of this service, it is announced.

Canvas Products Corporation, Fond du Lac, Wis., manufacturing a very fine tub cover. These covers are the best material and is guaranteed not to shrink, say. They are large cut and will not be affected by conditions. It will not freeze stiff in cold rooms and not become oily in warm weather.

Chicago Carton Company of 4433 Ogden Ave., Chicago, to the trade a sanitary, well-made liner for cans. so make ice cream cartons and butter cartons. The of "Perfection" on these cartons and liners assures ing public that it is a first quality goods, we are

Acme Extract & Chemical Works of Hanover, Pa., ring to the trade a new "Acme" custard flavor. By to this a small quantity of fruit, such as cherry, le, peach, etc., the respective cherry custard, pine-ustard or peach custard may be formed. Their Sici-uit flavors, in concrete form, are not made from c fruits and are non-alcoholic. They will remain will not separate and are miscible with water or it is claimed. They are excellent for flavoring ice pastries, soda syrups, candy, etc., we are told.

Baker Ice Machine Company, Inc., of Omaha, Neb., ering free to all ice cream manufacturers, a book "Dependable Refrigeration." This book describes strates the Baker ice machine which is a very good eed machine and will save the manufacturing costs 0 to 75 per cent over ice and salt.

at is called "the perfect package for bulk individuals" ed the trade by The Perfect Package Co., Newark, N. J. mpany claims that the public takes to this manner ice. This package is described as an ideal container purpose, easily filled. Closed with a handy pull cover, be quickly opened by the consumer without the usual enience, officials add.

ul juice of ripe California oranges are contained in s crushed orange fruit product, which officials say im-ices and sherbets. They say it meets every test of uit because it is the pure juice of the fruit, sterilized veniently packed in No. 10 vacuum tins.

ifornia "climate" is not everything that puts that state map. The oranges have had a lot to do with it, and ay the California Crushed Fruit Co. of Los Angeles trate the sweetness of this famous fruit into their t "Suncrush Orange" leaves a lingering memory on the s of all who taste it. As a flavor for the ice cream it has a wonderful appeal.

Sanisco ice cream sanwich machine is offered by anisco Co., Milwaukee. The company says it has to be an excellent sales booster. Prompt deliveries made, the company says.

Schott Bros. Co., West Salem, O., offer to the ice trade "quality tub covers that are lower in price." claim to be the originator and patentees of their cover, o royalties to pay.

ange tangerine for sherbets and ice cream is offered ade by the well-known firm of H. C. Schrank Co., ukee. Officials say satisfaction is assured. They add ave specialized in flavors and colors for the last 40

cream manufacturers are buying more Sewell wheels ver before, according to the Sewell Cushion Wheel Co., t, makers of these wheels. A list of the company's ers includes leading manufacturers in all sections of ntry, with such cities as Philadelphia, San Francisco, ile, St. Louis, Milwaukee and New Britain, Conn., ented.

What officials of the company call an efficient and cap-able looking sign standard is being offered the ice cream trade by the Standard Pressed Steel Co., of Jenkintown, Pa. It is called the "Hallowell" and is a steel display sign foot made of one piece unbreakable open hearth steel. The stand-ard is simply and efficiently made, with graceful, simple lines, has a drainage facility, and is used by some of the largest and best-known ice cream manufacturers in the country for their dealers' supply officials say. The Standard Pressed Steel Co., is one of the largest sign leg manufacturers in the country. They claim that the "Hallowell" is a sales-getter for any brand of ice cream. Literature and prices will be furnished upon request.

The Cherry-Bassett-Winner Company has transferred J. H. Ashmead from New York to Washington, D. C., it was announced last month. J. S. Taylor recently joined the Pitts-burgh division of the company. H. L. Rhinehart has assumed duties of manager of the Philadelphia division.

The Walker Vehicle Company, manufacturers of Walker electric trucks with general offices and factory in Chicago, have opened a branch office and service station at 314 St. Joseph Street, New Orleans, Louisiana. Thomas H. Shields, formerly a dealer for Walker Vehicle Company, has been appointed manager.

C. Nelson Manufacturing Company, St. Louis, will ex-hibit at the National Exposition its well-known styles of Nelson ice cream cabinets, together with a new drain feature which officials expect to be of much interest. The company's booth is No. 80. It will be in charge of James L. Nelson, secretary-treasurer of the firm, assisted by Lewis C. Chamberlain and Rufus Vaughan.

This firm will exhibit at Syracuse. Officials invite ice cream manufacturers to feel at home in their space.

The Zipp Manufacturing Company, Cleveland, Ohio, manufacturers of extracts and crushed fruits for ice cream manufacturers, will have their exhibit at booth No. 153 at the Cleveland Exposition. The Company announces that all its salesmen will be there to meet the trade. Manufacturers are welcomed to make the Zipp booth their headquarters.

C. J. Yuncker, president of the Michigan Dairy Boosters, will be in the Zipp booth to meet his trade, and in the even-ings at the Winton Hotel, where he will be registered. All Zipp salesmen will be at Winton Hotel.

Completion of an addition to the new factory of the Walker Vehicle Company, Chicago, manufacturers of Walker balance drive Electric trucks was anticipated the latter part of September, officials of that firm announced early last month. The present factory at State and 87th Street in Chicago was erected two years ago. The new addition, is a strictly modern and fireproof building, 360 feet by 100 feet, of steel, concrete and brick. The new building is to house four new electric heat-treating furnaces and the frame as-sembly department.

The press of orders, which has kept the present Walker factory busy day and night, is responsible for the addition, according to Company officials. It is estimated that this ad-dition plus the new manufacturing facilities of Walker Vehi-cles, Limited, of England, will more than double the total Walker production this year.

The Gifford-Wood Co., Hudson, N. Y., has recently issued its complete catalogue No. 70. Approximately 18,000 copies of this catalog are being distributed among ice and ice cream manufacturers.

The company also has issued a four-page folder describ-ing its new model C power field saw.

"Cream City Cans" are going bigger than ever with the ice cream trade if production figures at the Geuder-Paeschke Fry plant, Milwaukee, are any indication for a basis of judg-ment.

Conley foil still "foils" the attempts of chocolate coated bars of any willful liquidation. The Conley Foil Co. are one of the largest producers of tin foil in the country. Their headquarters are at New York.

"Everything in steel stampings" is the work of the Beeh-ler Steel Products Co. St. Louis, Mo. Their special handles

THE NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

for ice cream tubs have some qualities many others do not possess, they claim.

* * *

Much has been the variation in the price of sugar this year but the quality of the special sugar for ice cream manufacturers made by the Franklin Sugar Refining Co. of New York is as permanently fixed as the North Star. And it helps add quality to ice cream, the company says.

* * *

If outward appearances are a basis of judging quality as produced within the plant then there is nothing more to be desired in Eline's Chocolate. The plant and grounds of this institution these autumn days is certainly a symphonic poem of architecture and natural beauty.

* * *

A unique concern in the manufacture of metal products is the L. F. Grammes & Son Co., Allentown, Pa. Their catalog includes everything imaginable in the way of metal specialties. Their line for the ice cream trade is growing with each issue of their catalog.

* * *

Vermont, it is a general belief, leads the nation in maple syrup, but for a close second in producing the same flavor Mapleine, as produced by the Crescent Manufacturing Co. at Seattle, Wash., is sure giving the original a "run for the money."

* * *

Horine & Bowey Company of Chicago are putting out a nice extract and color catalog this year which should prove very interesting to the trade manufacturing ice cream. The company puts out a compound caramel flavor and it would be of benefit to manufacturers to try out a sample gallon.

* * *

The Individual Drinking Cup Company of Easton, Pa., are the original makers of the paper cup for the serving of individual ice cream as sundaes. They put out a snowy white container with a little cap top printed to advertise the company's brand of ice cream. The brand of cup is known as the "Dixie."

* * *

Kay & McClintock of Elyria, Ohio, have a universal ice cream cutter which they claim is speedy, safe and economical to operate. It can be adjusted to any size cut instantly. Many ice cream manufacturers will remember the interesting exhibit at the last convention in Cleveland.

* * *

The Meyer Dairy Equipment Company of Birmingham, Ala., and St. Louis, Mo., are showing a complete line of creamery, dairy and ice cream equipment and supplies this season. They have a large and well-balanced stock made by America's leading manufacturers of dairy equipment and supplies. The engineering department always offers its services to any firms interested in the dairy line. The firm is also headquarters for Cherry Perfection Equipment.

* * *

The Murray Iron Works Company of Burlington, Ia., are putting out a duplex creamery boiler which is gaining some notice in the creamery, ice cream and dairy field. They also have boilers for use in most any line of business. Their boilers are internally fired, self contained, and nearly smokeless and no brick work is required. Branches are at Chicago, Philadelphia, New York and Kansas City. Hawkeye Supply Co. of Mason City are handling Murray boilers in the several states west of the Great Lakes.

* * *

With the winter months, the season of big dinners, entertainments, etc., approaching, ice cream men dust off the ice cream molds that were more or less forgotten about during the summer months, and begin to watch the society columns for "coming events." Anticipating the average i. c. man's needs, W. W. Cassell of Vincennes, Ind., manufacturer and patentee of the Cassell Center Molds, calls attention to a few of the designs he is in position to furnish, in a full page ad in this issue. Turn to it now.

* * *

The famous B-K manufactured by the General Laboratories, Madison, Wis., is a very effective means for sterilizing milk cans, ice cream cans and other dairy equipment. It is one of the most efficient means known for killing the rapidly multiplying bacteria in milk and cream, officials say.

* * *

The St. Louis Gelatine Co. claims to supply "pure, hygrade gelatines, gums and ice cream powder." Service, quality and uniformity, is the company's slogan.

Blanke-Baer Extract & Preserving Company, Kings Highway, St. Louis, Mo., manufacture a vanilla known as BBB vanilla extract. One ounce excellent flavoring will flavor ten gallons of ice cream at a cost of less than four-tenths cents per gallon, it is

* * *

Pumps for all purposes in the ice cream plant offered by the Viking Pump Co. of Cedar Falls, Iowa, pumps are as lasting as the lives of the Vikings who sailed the northern seas hundreds of years ago. Pumps deliver a steady stream, eliminating splashing, excessive churning, which is of much importance in the weighing of ice cream ingredients from one holder to

* * *

There is something about the word "Elpam" that one a-guessing. Taste a brick of Elpam-flavored ice cream, however, and the mystery is solved, for it spells "reserve" if such a thing can be done. "Elpam" is a product of the G. W. Wardrop Co. of Boston, Mass., winning its own way into the list of ingredients for ican ice cream, the company says.

* * *

There are a half dozen or more of "red seal" ice cream manufactured by the Warner-Jenkinson Co. of St. Louis, Mo. that are used by ice cream manufacturers whose first site is quality. Among them are homo powder, vanilla, and tinted colors, extracts, milk of orange and ripe fruit. Year the Warner-Jenkinson Co. have added a large addition to their plant which more than doubles their capital. F. Meyer is president of the firm.

* * *

Wicander & Company, 50 Broad St., New York, offering the services of specialists to those installing ice cream cabinets or cold storage rooms. Wicander & Co. have manufacturers of cork products for more than 40 years and are in position to meet the requirements of the largest or the smallest plant.

* * *

"Now that the ice cream rush is over," says the Everhot Manufacturing Co. of Maywood, Ill., "ice cream manufacturers will have a little time to take the care of your equipment." This firm manufactures and solders iron, used very extensively by ice cream manufacturers for general repair work, and permanent branding of their cabinets and tubs. Write and clip and mail the coupon in their ad in this issue.

* * *

Standardized fittings, made according to the recommendations of the standardization committee of the National Association of Milk Dealers are being offered by Specialty Brass Co. of Kenosha, Wis. Their fittings on exhibit at the National Dairy Show in Syracuse, N. Y. are highly recommended. "Fittings to fit your needs" is a service by dealers everywhere in the United States. Quick service is assured.

* * *

To the average layman "Ucopco" doesn't mean much, but to the ice cream manufacturer it means quality. "Ucopco" is the product of the United Chemical and Products Co. of Chicago, who have met every demand for ice cream trade for a high grade gelatine. The "Ucopco" representative near you, at your service, is you may be.

* * *

We wouldn't attempt to name all the cities where "Sterling" refrigerating equipment and "Sterling" service is obtained. This little paragraph is merely to emphasize that there are seven reasons, according to the company's advertisement in this issue, why "Sterling" is superior. See Bulletin No. CR-24 explaining the "Sterling" line in detail. It will be sent upon request. The home of "Sterling" equipment is Kansas City, Mo.—made by the United Iron Works.

* * *

Completion of an addition to the new factory of Walker Vehicle Company, Chicago, manufacturers of balance drive Electric trucks was anticipated the last of September, officials of that firm announced the month. The present factory at State and 87th St. in Chicago was erected two years ago. The new addition is a strictly modern and fireproof building, 360 feet by 100 feet of steel, concrete and brick. The new building is equipped with four new electric heat-treating furnaces and the assembly department.

The press of orders, which has kept the present factory busy day and night, is responsible for the

Soldered Ultra

Which Do You Prefer?

Solderless "Tinokeh"

For the first time you can get the facts on soldered and welded, or solderless cans, without bias.

Heretofore, every manufacturer of cans would loudly claim that his can was best—whether a soldered can or a welded can—according to the type he made.

No wonder ice cream men were bewildered—and got a lot of wrong ideas on the merits of these two types.

SOLAR ICE CREAM CANS

We Make Both Soldered and Solderless Cans —

and we can therefore honestly tell the truth about each—we need hold nothing back, nor camouflage.

This season we again offer the good old reliable Soldered Ultra, the can that put more pep in can making than any event in the industry. When the Ultra started, it started a march of improvements—and today the Ultra heads the list—millions in service attest its goodness.

Now for the "TINOKEH." Well—you have seen the other so-called welded cans—but if you want a common sense solderless can—that weighs more—that's stronger—that anyone can re-tin—that has no feather-edge fissures—that does not depend on tin to fill up cracks—then—you must see the "TINOKEH."

Pound for pound our prices are 10% lower! Surely write us!

SOLAR-STURGES MFG. CO.

50 Church Street, New York City

838 Congress Street, Chicago, Ill.

84 Clay Street, San Francisco

THE NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

according to company officials. It is estimated that this addition plus the new manufacturing facilities of Walker Vehicles, Limited, of England, will more than double the total Walker production this year.

* * *

Ask a dozen ice cream men at any convention what is their second best seller, and the majority of them will chorus "Chocolate." The grade of chocolate used in making ice cream has a great deal to do with the volume of chocolate cream sales, according to the officials of the Stollwerck Chocolate Co. of New York, Chicago and Los Angeles. Stollwerck have always tried to produce a grade of chocolate that is best suited for the making of ice cream. They also manufacture a high grade coating for ice cream bars. The factory is located at Stamford, Connecticut.

* * *

A company that produces cartons for the largest manufacturers of butter, butterine, lard, etc., is surely in position to supply quality and quantity for the average ice cream manufacturer. The Sutherland Paper Co. of Kalamazoo, Mich., offer their high grade "Character Cartons" at attractive prices, whether purchased in lots of 5,000 or 5,000,000.

* * *

All other factors being equal, a tall man is supposed to possess a better stomach than a short man, for he makes a little go a long way. The same may apply to the tall tub put out by the Texas Barrel Co. of Houston, Texas. The increased sales of this tub indicate that it is becoming a favorite, due no doubt to its lasting qualities. Write the company for information on the tall tub, or better still, get a few for a trial. This company also makes a circular cabinet that is very popular in some sections.

* * *

Don't wait till the holidays are here before purchasing the fancy ice cream forms need for making ice cream for the special occasions. Schall & Co. of 81 Barclay St., New York City make a specialty of fancy ice cream forms, of standard and special designs. Inquiries will be gratefully received and courteously attended to.

* * *

There is a lot of talk going around about "dealer helps," meaning advertising of one form or another, of course, but there is another form as advertised by the John Schroeder Lumber Company that holds its own with any of them. It is the Schroeder Perfection Cabinet that has given satisfaction wherever it has been used for many years. Yes, you may order a dozen cabinets or a dozen carloads from the John Schroeder Lumber Co. of Milwaukee, and the order will be given immediate attention.

* * *

Sethness Co. of Chicago, Denver and Pittsburgh are offering an exceptionally high grade line of fruits, extracts, colors, etc., under their well known Cosco brand, Sethness Company, have always endeavored to furnish ice cream manufacturers with the highest quality at all times, and they are now doing an ever increasing business with the ice cream trade, according to C. H. Sethness, secretary of the company.

* * *

For a great many years C. E. Downey, president of Downey-Turnquist & Co. of Chicago, has devoted his time to the development of the ice cream business during the winter months, and Mr. Downey's firm is now offering to the ice cream manufacturer the services of a new department with the view of boosting the ice cream man's profits during the dull season. Mr. Downey also announces the appointment of G. H. Steuer as vice-president, in charge of production for the firm. Both Mr. Steuer's and Mr. Downey's pictures appear on another page. Business has increased wonderfully, Mr. Downey reports, and they have been obliged to obtain another floor in the building they occupy, thus increasing their space 100 per cent. Part of the additional floor space is being used for the manufacture of new products, among them being new flavoring extracts, soft drink specialties, certified food colors, toiler preparations, and "Steuer's" household home remedies.

* * *

Where are your cans during the winter season? Are they lying in a storage room unprotected, rusting, deteriorating more rapidly than if they were in actual use? A few years ago such a condition was unavoidable, but today we do the impossible of the past. A product known as "No-Ox-Id," made by the Dearborn Chemical Co. of Chicago is guaranteed to prevent the rusting of cans and other metal equipment of the ice cream factory when not in use. If you are interested saving your equipment during the season

when it is lying idle, it would pay you to invest Ox-Id."

* * *

It is no longer necessary to ice cabinets ever according to the officers of the Dry-Zero Insulation Co. of Chicago, and Oakland, California. Their new Dry-Zero is said to keep ice cream in perfect condition 48 the same amount of ice and salt that is being used in 24 hours. Turn to their advertisement in one of the colored sections of this issue, to get the full details.

* * *

Even some of the most experienced makers of cream seem to be under the impression that if they make a hundred molds of fancy ice cream, they need 10 to 50 duplicate forms. They used to, but not Stechow of Shaw & Stechow, 904 Central Ave., who has perfected his new type of mold. The S. & S. mold is a convenient one, and economical one, for the manufacturer of fancy ice cream, for one form only is needed for any amount of fancy cream. Molds can be furnished in any size or shape, with any design. See the S. & S. advertisement in this issue, or write Mr. Stechow for particulars.

* * *

The manufacture of ice cream as demanded by the public today requires more than the mere mixing of sugar and vanilla. A firm in Boston, Chittenden Co., are offering ice cream powder preparations to enhance the richness, smoothness and viscosity of ice cream mix, and permit obtaining of a better uniform overrun with a shorter period of ageing.

* * *

Recent purchases of canvas goods from the U. S. Government at reduced prices has enabled the Scott Manufacturing Co. of Omaha, Nebraska to offer ice cream tubs at very attractive prices. Eighteen and 20 ounce tubs are used, making a very strong and substantial tub at low prices are effective as long as the material lasts.

* * *

At the ice cream conventions we hear a lot of talk about shipping out ice cream tubs, never again to return, record of where they are at. A convenient little device known as "Tag Bak" has been perfected by Tag O'Brien of Ogden Ave., Milwaukee, which keeps an accurate record of where tubs are, thus reducing the number of tubs for shipping business, and eliminating disputes with customers. This system was first used by the Luick Ice Cream Co. of Milwaukee.

* * *

Foil wrappers for ice cream bars that are sold by the guaranteed count, that are tough, hard to tear, backed with pure wax paper, made from guaranteed non-fading, brilliant lustre, beautiful in design, free from ink stains or off-set, and known as the Mac Wrappers, are being offered by the U. S. Foil Co. of Louisville, Ky. A postcard will bring to you samples of beautiful designs.

* * *

A machine that automatically cuts, dips and wraps a hundred dozen chocolate coated ice cream bars an hour can be shown in booth No. 89 at the Cleveland Exposition. Eighty dozen an hour is the daily average capacity of the machine, manufactured by the Anderson Bros. of Rockford, Ill.

* * *

Mr. Monrad who has been transferred to the Little Falls office of the Chr. Hansen Laboratories of Little Falls, N. Y. is doing fine and certainly is not slow in finding a lot of staunch friends and customers throughout this section. If you ever feel blue and down-in-the-gills, pick up one of his issues of "CHeeSE" and give yourself a laugh.

* * *

The Heathized Products Company which claims to put the pep into ice cream, and which company is headed by Paul Heath, is doing a lively business and keeps a large force and office people on the job. Heathized Butter Process is handled through The Heathized Butter Co. of Baltimore, Md., of which Mr. Rosenbery is manager.

* * *

The Kimble Glass Company of Vineland, N. J., Chicago, Ill., and New York, N. Y., can show a fine line of glassware. The company is one of the best-known in the field and put forth constant effort to improve its product to a perfect line as is. The glassware now has etched and graduation lines in permanent black enamel

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

See the Eskimo Pie Makers at the Convention

We will demonstrate the most economical way to make uniform Eskimo Pies. See the machines in actual operation, and you'll see the way to lower costs and more profit sales this year.

The Biggest Eskimo Pie Year

Manufacturers who sold 5c Eskimo Pies last year—are throwing the throttle wide open and are going full speed ahead this year. They know that Eskimo Pie is the sure way to increased, profitable winter gallonage.

September Breaks All Records

September was the biggest month in Eskimo Pie wrapper sales in our history. Those who made Eskimo Pies last year are doubling and tripling their orders. New manufacturers—big and little are coming in every day. October is showing even more pep than September.

Get In and Cash In

Someone in your territory is going to profit from Eskimo Pie this year. Why not you? It's easier to sell than compete against Eskimo Pie. The public preference—plus a big comprehensive, merchandising co-operation are the factors that make Eskimo Pie the one best bet this year.

Get the "Cold Facts" Book It tells all

This book shows in A B C form the most profitable and most economical way to make and merchandise Eskimo Pies for bigger gallonage at more profit. Get the book at the convention or write for it.

See us at Convention Hall or at our headquarters at the Cleveland Hotel.

Act Now—Write or wire your orders for wrappers—then meet us at the convention.

ESKIMO PIE CORPORATION

5 North Wabash Avenue
Chicago, Illinois

glassware leaving the factory and it will withstand the hardest kind of laboratory usage such as acid contacts, boiling water, soap and cleaning powders.

The Myles Salt Company of New Orleans, says it has a fine product for use in the handling of ice cream. It is excellent for the freezing and has lasting qualities. The company has an interesting slogan, "Insure your pack with Myles."

The Louis F. Nafis, Inc., well-known glassware company are very happy and doing very well in their new home on North Desplaines St. Chicago. Mr. and Mrs. Nafis are well known to the trade and usually make all the conventions together. The company has been in the field for twenty years and this backs the claim that Nafis scientific glassware has been recognized as one of the leading lines in the country.

Damrow Brothers Co., of Fond du Lac, Wis., has given full information of its extensive line listed in a fine catalogue which can be had for the asking. The company has a line of creamery equipment, condensing machinery, and storage tanks. Get their catalogue.

The Erecting Engineers Company of 9 So. Clinton St., Chicago are "builders of better plants." They are experts in the refrigeration line and for Sterling model plants it will pay a contemplating builder to get in touch with this firm, officials say.

The Duluth Cooperage Company of Duluth, Minnesota, the city of hills and beautiful complexions, can show a fir ice cream tub equally as attractive as the aforesaid. It is a durable, well finished tub, painted to any distinguishing color and a good advertisement for ice cream, officials say. The quality, finish and workmanship are of the highest caliber, it is claimed.

Ferguson-Lander Manufacturing Company of Chicago, puts out an ice cream carry-home bucket which can't be beat for neatness and attractiveness. It makes an appeal to the purchaser of any brand of ice cream. Comes in a variety of styles and sizes sufficient for average requirements. Samples and prices will be submitted by request to the company.

The Fortune Products Company of Chicago puts out a "Thinflo" coating of high-grade chocolate made especially for the purpose of coating ice cream pies in the right manner. Five cent pies go humming when coated with this excellent covering.

Epplesheimer & Company of New York City put out a line of fancy shaped ice cream molds for large and individual serving which would attract any ice cream manufacturer. They have a nice booklet which can be had for the asking and many molds of interest to the manufacturer can be found illustrated therein. Winter is the time for this special form of serving and many suggestions can be found in their booklet.

The Federal Asbestos Company of Milwaukee, Wis., puts a cork insulation in your cold storage room which will be permanent and of efficient insulation. Their double thick insulation for brine and ammonia pipe lines can't be beat. They are also dealers in cork board, granulated cork, cold storage doors, cold storage gasketing, asphalt and ice cream cabinets.

The Economy Silo Manufacturing Co., of Frederick, Md., has a paramount cabinet for ice cream which is very attractive. It is made of California Redwood. This is unsurpassed for insulating wood. The cabinets have removable bottoms and removable brass outlets. Tubs and metal lined cabinets are offered in all sizes and styles.

That ice cream manufacturers are ever seeking to impress the public with the care they take in delivering a sanitary product is reflected in the increased sales of Allen-One-Piece can liners as reported by the Allen Candy Co. of Pontiac, Illinois, who are manufacturers of this practical need for progressive ice cream manufacturers.

Where weight is a consideration and insulation a necessity, Balsa wood meets every requirement. The possibilities

of this strange wood is demonstrated at its best in the various styles of ice cream cabinets as put out by the Balsa Co. of New York City. If you want something to fool your friends, get a sample of Balsa wood and them to lift it. The surprise their faces will register worth photographing.

One of the achievements in 1923 dairy equipment was a new pasteurizer as developed by the American Brass Works of Cincinnati, O. The principle of operation is entirely new and practical. This new equipment has already been accorded a reception that speaks well for its future popularity.

With the oil controversy at its height every man that geographical location "Mid-Continent" would create the impression that nothing existed there but the auto product. One look at the immense deposits of salt coal by the American Salt & Coal Co. of Kansas City in that territory is sufficient to dispell this oily impression. The carload after carload of "American" salt going to the ice cream trade makes one hunger for the product forward to help preserve.

St. Louis business folks like to consider themselves being in the commercial hub of America. Their concentration and industrial variety makes them feel that way. And as a centrally located concern in the dairy manufacturing vacuum pans, hot wells, milk coolers, having extensive equipment for repairing all kinds of cream and dairy equipment, the Alois Aufrechtig & Co. Sheet Iron Mfg. Co. of that city has long held a prominence and satisfaction to its customers.

The Standard Pressed Steel Co., Jenkintown, Pa., has the ice cream trade steel display sign legs, products supporting display signs in front of stores. These signs are made in one piece, of open hearth steel, grooved sign frame to be fitted. They are claimed to be unbreakable.

The Vilter Manufacturing Co., Milwaukee, is in the business to supply ice cream manufacturers with machinery which to make their own ice. They invite manufacturers to consult them in regard to machinery for cooling the ice cream room.

This company is located at Louisville, Ky. It is the foil for the wrapping of Eskimo Pies. Officials will be glad to have manufacturers consult them about their needs in this line.

Water-proof, airtight, cushion gaskets for refrigerator doors and airtight sectional cooling coils and refrigerator-joints, are supplied by E. J. Wirfs, 17th St., St. Louis. They invite members of the trade to get samples and prices, stating size and quantity needed.

The Peerless Paper Box Manufacturing Co., Cleveland, O., offers ice cream cartons to the trade. Companies are invited to delegates to the national convention to visit their place of business, at 1137 W. Sixth St., while in Cleveland.

Universal Shops, Inc., Horseheads, N. Y., manufactures the Universal gauge protector, small brick or pipe machines, and Monel metal hoppers for freezing machines. Officials say they design and build anything for the ice cream and milk plant.

Ice cream tubs and cabinets are offered by the J. Verville Co., Hancock, Mich. The company has been active in the ice cream industry for several years. They claim that their products have given full satisfaction wherever they have been used.

Sanitary fittings and tubing are offered by the Wisconsin Specialty Co., Waukesha, Wis. These fittings, companies officials say, are made of solid nickel alloy. They are specially designed for wear and quality, service and economy, officials claim.

"Weiscans" are built to solve the manufacturing problems, according to the manufacturer, the Fibre Container Corporation, Monroe, Mich. They are built to stand rough usage, the company claims.

York refrigerating machinery is handled by the York Refrigerating Co., Chicago, Ill. The company invites

The H. H. Miller
Industries Co.

CANTON, OHIO

Originators and Manufacturers of
MILLER PASTEURIZERS, FINE
ICE CREAM FREEZERS, MIXERS
and DAIRY MACHINERY

THE NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

facturers to let it show them why this machinery is "in a class to itself." J. G. Hammerschlag, 1016 Majestic Building, Milwaukee, is Wisconsin manager.

Clifton Manufacturing Co. has announced the appointment of the following representatives: A. B. Avery, 220 N. State St., Chicago; A. M. Wooster, 1425 Chemical Building, St. Louis; L. S. Castle, 4858 Chemical Building, St. Louis. This will enable the company better to serve the northern trade, officials say.

In the new booklet issued by the Nutting Truck Co., Faribault, Minn., manufacturers, their truck is called the "Celebrated Truck." Nutting trucks save a great deal of time in transporting filled or empty cans and other equipment about the ice cream plant. They are exceedingly well made, stand up under the hardest kind of service and bear up well under the most extraordinary test, they claim. Send for the booklet.

"Packaging ice cream at the Plant Usually Results In Time and labor saved for Your dealers. People Are Partial to Easy-to-handle containers and Re-act favorably to purity paper cans. Constant Assiduity is Necessary to Secure the satisfaction of your customers"—so say the Purity Paper Vessels Co. of Baltimore, Md., in recent advertising. And the ice cream manufacturers silently signify their approval by continually sending in repeat orders, according to officials. W. R. Lenderking, general manager of the company, will gladly assist ice cream manufacturers in solving their bulk cream packaging problems.

Sales efforts and advertising of the right kind, properly directed helps wonderfully to stimulate sales of ice cream during the so-called dull winter season. The series of ice cream talks offered by Kunsman's Ad Service of Reading, Pa. takes care of the advertising end of a winter sales campaign to mighty good advantage, according to the company's claims. They say their line is worthy of investigation.

With those marketing ice cream in the little paper cup, the "Kleen Kup" met with instant favor, we are told. The "Kleen Kup" is free from wax, made of pure white spruce wood fibre, easily filled because of the large unobstructed opening, and requires little storage, it is claimed. These cups are made by the Mono Service Co. of Newark, N. J. They are intended to sell ice cream in winter.

The National Fruit Flavor Co. is offering a trial gallon of its noted flavor "Cremilla." Use as much of it as you choose for the trial, officials say, and if not perfectly satisfied return, and all charges will be cancelled upon receipt of the unused portion.

With the price of the chocolate coated ice cream bar reduced to five cents, there was need for a method of making the bars by machine at a cost much less than that of the old hand method. This need was filled by the Northwestern Corporation of Morris, Ill., whose new model machine reduced the cost of the ice cream bars to 20 cents a dozen.

"Ask Graham, he knows," according to a certain manufacturer of copper ware. Mr. Graham of the Graham Ice Cream Co., Omaha, spoke very favorably of the copper steam-jacketed gelatine melter which he purchased of the Hamilton Copper & Brass Works of Hamilton, Ohio.

You can fill 'em, fifty cartons a minute with the Little Lincoln filler made by the Icicle Sales Company of Lincoln, Nebraska, we are told. Theirs is a convenient little device for the filling of Icicle cartons. The manufacturers say it is very simple in design and nothing to get out of order. This company also promotes Icicle, and will be glad to give anyone interested information about them.

The "Open Door" policy and the Jamison cold storage door policy may sound alike, but they are, in reality, quite different. Jamison cold storage doors are noted for being efficient where efficiency is needed most, it is claimed. With the patented adjustable spring hinges and self-tightening fasteners, the Jamison door is all that can be asked for, the company says.

Exhibitors at the dairy show were very much interested in the new style of cabinets being put out by the Stout Manufacturing Company of Milwaukee. It is a self-serving brick cabinet with each size and flavor carried in its own com-

partment. Mr. Payne, manager of the company, reports that manufacturers of ice cream expressed their approval of design.

R. E. Tiffany, president and vice-president of Tiffany Company, Inc., of Carbondale, Pa., manufacturer of cream and soft drink cabinets, reports that the trade has expressed approval of the extra heavy gauge hard steel, which is very difficult to puncture. They are using picks used in icing cabinets, they claim. All are fitted with a one-inch brass nickel with a special and exceptionally well built.

OKLAHOMANS WILL ATTEND EXPOSITION

Reservations have been made at the Hotel C for at least four members of the Oklahoma Association of Ice Cream Manufacturers. Secretary J. B. advises The Ice Cream Review that at this hotel found J. W. Parker of Enid, F. J. Bouvy of Tulsa, W. Hauk of Tulsa and Gabe Parker of Muskogee.

ARKANSANS TO ATTEND NATIONAL CONVENTION

The Arkansas Ice Cream Manufacturers' Association will be represented at the Cleveland exposition by George F. Cress, Prescott Ice Cream Co., Prescott, Scott, A. J. Scott, A. J. Scott Ice Cream Co., Jacksonville, and Will Terry, Terry Dairy Co., Little Rock.

This is reported to The Ice Cream Review by Meyer, secretary of the Arkansas Ice Cream Manufacturers' Association, who made inquiry as to how many of his members would attend the national convention. Others from that state also are expected to go.

PLANS FOR LARGE ICE CREAM PLANT IN SEATTLE PLY ORIENT ANNOUNCED AT SEATTLE

Plans for the erection in Seattle, Wash., of a 1,000 ice cream plant, has been announced by F. V. president of the Seattle Ice Cream Co. This will be one of the finest plants in the West, it is promised. The erection of the new plant, says Mr. Fisher, was made necessary by the rapid expansion of the company's business, not only in Seattle and western Washington and but also in the shipment of the mix to the other states where frozen and distributed there.

Further information concerning this plant will appear in an early issue of The Ice Cream Review.

HAROLD SINCLAIR WILL MISS EXPOSITION

A letter from Harold A. Sinclair, who is now in Canada, conveys the information that physical conditions will not allow him to attend the exposition. Mr. Sinclair was at Lac La Pêche, Quebec. He stated that he will return to New York October 17 to resume work, but that he would not be able to attend the convention in December, when he will take in the Pacific coast exposition at Vancouver, B. C.

GEORGIANS READY FOR EXPOSITION

J. D. Kinnett, president of the Georgia Ice Cream Manufacturers' Association, advises The Ice Cream Review that 60 per cent of his membership will attend the national convention. The association has been holding meetings to make preparations to attend.

Southern Association Officers to Attend Convention.

Clopton, secretary of the Southern Association of Ice Cream Manufacturers, will be at the exposition. National convention delegates about the Southern Association will meet at Little Rock in December. The Dixie convention will be held December 4, 5 and 6.

Clopton, of course, is greatly interested in the work of the national association, as well as the members, but he wants everybody to know that the association expects to have one of the best conventions in its history.

Other Southern officers are expected to attend the exposition. President M. J. Costa of Athens, Georgia, regular attendant at national conventions, as is Fred Scanlin of Atlanta, who represents the association as delegate to the convention.

NATIONAL ICE CREAM EXPOSITION MEANS OPPORTUNITY. LET NOTHING KEEP YOU AWAY.

PATENT GRANTED.

The United States has granted to the J. W. Hoodwin Co. of Chicago a complete patent covering the name, design and idea of Survitors, cardboard ice cream cone carriers, according to announcement to The Ice Cream Review by The Daigger Corp.

FARE AND A HALF.

When you purchase transportation ask the agent for a convention certificate. It will entitle you to a half-fare return ticket.

NEED ANY HELP?

If you want help for your factory, the quickest and cheapest way to locate same is through The Ice Cream Review Want Department.

WANT

DEPARTMENT

HELP WANTED

WANTED—Salesman. Experienced in selling supplies to manufacturers in the ice cream and dairy trade in the Middle West. State salary expected. Good opportunity with old established firm. Applications confidential. Address R-676 The Ice Cream Review. 11-23

EMPLOYERS!—Men, men, men—the crying need of the day! If you need any men in your business today, read the following ads and see if you can use any of these. The fact that these men are advertising here stamps them as unusually progressive. Write them and give them a chance to sell their services to you. "Ice Cream Review," Milwaukee, Wis. 11-23

POSITION WANTED

POSITION WANTED—Young man experienced in mixing, standardization of solids, overrun and acidity, viscolizing, freezing, factory management and sales. Can handle men. Desires position in ice cream factory or work in pasteurizing room of milk plant. Will go anywhere. Address R-683 Ice Cream Review. 11-23

POSITION WANTED—Are you a manufacturer of food products, or, electrical and mechanical apparatus for sale to ice cream manufacturers, confectioners and bakers? Do you desire representation by party thoroughly competent to handle your line? Have had ten years experience with this class of trade and am graduate of law. Have office at Baltimore where I represent three nationally known concerns. Want one additional account for reason that one of my company's can not fill all my orders. If integrity, clean record and efficiency counts to you, and will mean exclusive representation, address, Manager 510 Park Bank Building, Baltimore, Maryland. 11-23

FOR SALE BARGAINS
BUSINESS

FOR SALE—Complete ice cream factory in a rapidly growing Southern city, with 20,000 population. Excellent going business with everything in the very pink of condition, with three railroad and one steamer line, located within twelve miles of one of the finest seaside resorts on the South Atlantic coast and a real bargain for one looking for such opportunity. Address: R-644, The Ice Cream Review. 11-23

FOR SALE—CREAMERY—Fully equipped, with all machinery to make a creamery complete. Only run a few months. Will sell equipment and rent building if so desired. Everything is run with one large motor. Will sell very cheap if sold this fall. Plant is running at present. Thompson Bros. Ice Cream Co., Butler, Pa. 11-23

MACHINERY AND SUPPLIES AND BOILERS, NEW AND SECOND HAND
Electric Motors, Engines, Pumps, Pipes and fittings, Valves, Belting, Shafting, Bearings and Pulleys. Money Saving Prices. Harris Machinery Co., Minneapolis, Minn. 9-23tf

FOR SALE—Owing to the purchase of two of the local ice cream companies, we have the following equipment for sale: Four Tyson 40-quart freezers, motor driven; two Cherry 60-quart freezers, motor driven; one Emery Thompson 40-quart vertical freezer, belt driven, used one month; one Allman Gas Engine Co.'s tub freezer, self-emptying; one 400-gallon Cherry pasteurizer, used one season; eight delivery trucks with Meyer bodies; one trailer, 5 or 7 tons capacity, which has been in use for a short period for carrying ice cream to the Niagara Falls branch; one Creasey 50Y ice crusher, with hopper attachment. Any further information will be gladly given. Rich Ice Cream Co., 470 Spring St., Buffalo, N. Y. 9-23tf

FOR SALE—One 150 gallon coil pasteurizer without circulating tank. In excellent condition, \$150.00. Address R-585 Ice Cream Review. 11-23

The ICE CREAM REVIEW

Number 4

MILWAUKEE, WISCONSIN — November, 1923

Two Dollars a Year

the Cherry 80 Quam Freezer

IMPORTANT though it is, do not think of this freezer only in terms of its unusual over-capacity. Think of it, too, in terms of its wonderfully precise and excellent construction—its simplicity—its fast and easy operation—its absolute dependability—its freedom from trouble—the ease and speed with which it can be cleaned—its long life—its ridiculously low cost of operation and upkeep—the perfection of its output.

Think of it as a freezer which is so precisely built that every part of the driving mechanism is machined to two-thousandths of an inch. Think of it as a freezer which is so substantially built of such fine quality materials that *there is no wear* on it.

And, then, think of it as a freezer which is marketed at a price which is little if any more than that of freezers of *less* capacity and *less* excellent construction!

National Association Officers for 1923-24

VERNON F. HOVEY,
Schenectady, N. Y.
President.

N. LOEWENSTEIN,
Chicago
Secretary.

W. W. CAMPBELL,
Shreveport, La.
Vice President.

MANY gratifying impressions linger after the ice cream carnival at Cleveland last month. A passionate reflection brings out many cheering upon the stability of this industry and continued advancement.

Convention officers must feel fully content with the fruit of their labors. Cleveland was a veritable Mecca for ice cream men of virtually every part of the country. For one week the city literally was America's "ice cream capital."

Both the exposition and the convention were up to all expectations. Interest and enthusiasm were maintained throughout all convention sessions. Optimism was everywhere. The exposition hall was a treasure-trove of information. Every machine, device and substance connected with the industry was displayed. It seemed as if the entire supply industry was on dress parade. The greatest gathering of spectators in the history of the industry.

All in all, it was a job well done. Every ice cream man has great cause for pride in an industry where two groups can so effectively collaborate for advancement, such as held at Cleveland. It was the national ice cream industry's greatest convention, leaders agree. It was the ice cream industry's greatest co-operative achievement. A new triumph is recorded.

THE convention season is on in full swing. The state associations have announced their meeting dates. Officials, without exception, express themselves as looking forward to record gatherings. In addition to the conventions are the ice cream courses. Leading universities are announcing their winter classes in ice cream making. There is a liberal education to be gained both at your convention and at short courses.

Cleveland convention emphasized the fact that association rapidly is approaching the point where separate sessions will be necessary. Growth in attendance has brought about a problem.

It would not be surprising to see the association next year have two separate programs, or maybe so alter them on one program that they may address different bodies of delegates. Hotel conference rooms are proving inadequate to accommodate the delegates who now attend the national convention and learn.

The Georgian room of the Hotel Cleveland literally overflowed with humanity at every session of the association. Relief from this congestion will be sought in 1924, it seems sure, after hearing association officers press themselves in this connection.

Ice cream manufacturers disappointed with the margin between income and outgo wonder where it has gone. The man who does not like to face reality will never figure out his difficulty.

In the past we have too greatly followed the urge for more accounts. Some of us still are blindly rushing for more accounts and not studying how to get the best out of the ones we have. Such people always will be in more trouble.

It must be remembered that every extra dealer or patronage you get costs you so much in service and the point to be decided is whether a new dealer is worth the effort that you could just as well put into an old account in pushing his sales. It is much better to push up the volume of a "live," reliable dealer to the extent of five gallons than to let him stand still and go after another man whose total volume is only to five gallons.

Some of us blindly rush after new accounts without giving proper attention to the old. That's generally the matter with the manufacturer who thinks he is doing good business but can't see it in the figures.

Like in the old home-town, where you grew up wild with the flowers, they continue that sweet, old-time habit of gathering loving hearts together in ice cream socials, every once in a while. You probably remember the many evenings you have perspired over the ice in a desperate battle between elbow power and the forces of home refrigeration. If someone had at first suggested sending out to the corner soda stand a dozen bricks, he would have had your vote on the ballot, and your everlasting gratitude to boot. If he would have had the endorsement of the local health officer.

Slipping that came to our desk the other day, we are wondering where the good brothers of the church in the old home-town assembled for an "ice cream festival" and were quite shocked at the extrava-

gance of the brother deacon who was chairman of the preparations committee and incidentally was the local health officer. This radical and worldly man had the nerve to turn his back upon the ancient freezer of the church's sewing society and ordered some manufactured ice cream. This precipitated a situation that turned the festival into a free for all debate, with the apostles of missionary thrift on one side and worldly advocates of sanitation and common sense on the other. The local paper took up the debate at some length, and the last ringside accounts showed the brother deacon of the preparations committee leading on points—several of them.

Every youngster in the village that had ever been sentenced to the task of "turning the crank" was rooting hard for him. Also all the citizens who know bacteria from bed-bugs.

AS YEAR after year passes in the ice cream industry, manufacturers gradually work away from many plant problems. The same can not be said of sales troubles, for though we are learning something every day about expanding our market, this proposition is so net-worked with other matters that we are continually untangling one ravel and facing another knot in the same place.

"Distribution" is the great cry in trade today. It is one thing to develop sales in a certain nearby locality and quite another to make this business profitable. The manufacturer must give more attention to trucks, their proper care, cost of upkeep, etc.

One manufacturer is losing money because the lure of a comparatively small piece of business leads him to serve customers at great wear and tear to his trucks—customers that really should be served by someone else.

Going after all the **new** business that can possibly be developed is something to be encouraged. But be sure it is **new** business that you are after and not just conquest for the glory of another man's business. Also be sure that you are equipped to handle this business. That is very important.

The truck has done much for the ice cream industry. It should be appreciated more. It has bridged many gaps for the ice cream manufacturer.

Every manufacturer should study distribution. He should give careful thought to his surroundings and seek a connection with points where wholesale ice cream is not served.

Boost your roads. Strive for improved highways. Equip yourself with trucks. Study distribution from every angle.

IF YOU are among the people who occasionally go out to seek the vain pleasures of this world, you probably have seen many movie comics showing a freckled face boy or a bewhiskered tramp burying his face in a juicy pie with much enthusiasm and satisfaction.

The thought probably has occurred to you, why

don't the movie people break the monotony once in a while by introducing an ice cream cone or a dish of frozen cream when they want to suggest relish and contentment? One answer from the movie people is, ice cream doesn't "register" well in the films. The answer is far from satisfying. Printers and lithographers have succeeded in portraying ice cream on paper with all its appeal to the imagination.

The truth of the matter is, the ice cream industry is bucking an American tradition. The movie people are slow to realize that this tradition is crumbling and that ice cream is now taking the place in the American home formerly held by mother's pies.

In this way we understand that it is a good idea to keep after mother for she decides the dessert proposition for several people.

A cone manufacturer in the South recently had movie people "shoot" the interior of his plant, showing cones in their various forms of production, till the time when they were filled with ice cream and eaten. This publicity was valuable to the ice cream industry. It would do the industry much good to have ice cream scenes "shot" at every opportunity and in every form, showing ice cream in the freezers, in dishes and in containers ready to take home.

Everybody is more or less subject to subtle suggestions. When you see the movie hero gracefully select a smoke, it makes you fairly hunger for your favorite "pill," "boiler," or "weed," depending upon your form of indulgence. An ice cream scene would be sure to send scores of people scurrying to a soda fountain after the show.

IF THE colonel's lady and Judith O'Grady ever were to compare notes as to their choice in ice cream flavors, they both would better understand that they are "sisters under their skin," as the poet declared. Judith might express a preference for one or another of vanilla, chocolate or strawberry flavors, while the colonel's lady, no doubt, would show more familiarity with a certain ice cream custard or combination of fruit flavors. But the point is, they would be on perfectly common ground over a plate or cone of any kind of ice cream.

Ice cream is the democratic dish of a nation born of democratic impulse. It is the great leveler of ranks and stations and classes.

At Cleveland last month, ice cream manufacturers co-operated in manufacturing a gigantic brick of ice cream. They sent it to his excellency, the president of the United States. There was much more ice cream in that brick than the president ever could eat.

It would be interesting to know just how many different people, of different classes and ranks, ate of the president's brick, for he must have divided with his retinue and attaches.

It is very probable that the list of people who aided Mr. Coolidge in "killing" that brick might include, say, ambassadors, chauffeurs, senators, waiters, consuls, foot-

men, generals, chefs, and secretaries, with maybe governesses, scrub women and ministers plenty thrown in. Most everybody having any business around the White House probably got

The one thing auguring for the security of cream industry is its democracy.

IN DISCUSSING preparations for the Oklahoma Convention, President J. W. Parker, at Cleveland, paid a tribute to his association's secretary, J. B. Porter, to whom much credit for Oklahoma's good convention records, he said.

"Porter," said Mr. Parker, "plans for a convention like he handles his business, laying out every detail of the affair systematically and checking off every item after it has been taken care of. He studies his convention plans like he studies his business. His membership lists his customers; he literally sells them his convention. First he makes it something good, a quality convention. Then he goes after the customers."

Mr. Parker believes the convention this year will be the best on record for his association.

BULLETIN OF EVENTS

- Association of Ice Cream Manufacturers of Pennsylvania**—Annual Convention, Nov. 13 to 15, 1923. Convention headquarters, Penn-Alto Hotel, Altoona, Pa.
- Ice Cream Manufacturers' Association of West Virginia**—Convention, Parkersburg, November 19 and 20. Convention headquarters, Hotel Chancellor. Secretary, C. F. Huntington.
- Oklahoma Association of Ice Cream Manufacturers**—Annual Convention, Tulsa, November 21, 22 and 23. Convention headquarters Hotel Tulsa. Secretary, J. B. Porter, Tulsa.
- Texas Ice Cream Manufacturers' Association**—Annual Convention, Galveston, November 26, 27 and 28. Secretary, White, Mistletoe Creameries, San Antonio.
- Southern Association of Ice Cream Manufacturers**—Eleventh Annual Convention, Little Rock, Ark., December 4. Convention headquarters, Marion Hotel. Secretary, Clopton, Decatur, Ala.
- Pacific Ice Cream Manufacturers' Association**—Annual Convention, Vancouver, B. C., Dec. 3, 4 and 5. Secretary, Walker, Tacoma, Wash.
- Arkansas Ice Cream Manufacturers' Association**—Annual Convention, Little Rock, December 3. Convention headquarters, Marion Hotel. Secretary, G. A. Meyer, Stuttgart.
- Association of Ice Cream Manufacturers of New York State**—Annual Convention, Rochester, N. Y., December 5 and 6. Secretary, A. M. Le Messurier, Box 676, Syracuse.
- Association of Ice Cream Manufacturers of Iowa**—Annual Convention, Mason City, December 10, 11 and 12. Convention headquarters, Hotel Hanford. Secretary, P. N. Crockett, Good Block, Des Moines.
- Metropolitan Ice Cream Manufacturers' Association**—Annual Convention, Newark, N. J., December 11. Convention headquarters, Newark Athletic Club. Secretary, W. H. Little, Tan Ice Cream Co., 596 Market St., Newark, N. J.
- Illinois Association of Ice Cream Manufacturers**—Annual Convention, Chicago, December 11 and 12. Convention headquarters, Hotel Sherman. Secretary, N. Loewenstein, Clark St., Chicago.
- North Carolina Ice Cream Manufacturers' Association**—Annual Convention, Winston-Salem, January 15 and 16, 1924. Convention headquarters, Robert E. Lee Hotel. Secretary, E. Dixon, Fayetteville, N. C.
- Kansas Association of Ice Cream Manufacturers**—Annual Convention, Wichita, January 22, 23 and 24, 1924. Secretary, B. T. Perkins, Pittsburg.
- Louisiana Association of Ice Cream Manufacturers**—Annual Convention, Baton Rouge, sometime in January, 1924. Secretary, N. F. Manning, Monroe.
- California and Southwestern States Ice Cream Manufacturers' Association**—Annual Convention, Los Angeles, Cal., January 11 and 12, 1924. Secretary, Robert F. Grosse, 5792 Santa Ave., Oakland, Cal.
- New England Association of Ice Cream Manufacturers**—Annual Convention, Boston, January 16 and 17, 1924. Convention headquarters, Copley Plaza Hotel. Secretary, W. P. Wood, 51 Cornhill, Room 401, Boston.
- Mississippi Ice Cream Manufacturers' Association**—Annual Convention, Laurel, January 8 and 9. Convention headquarters, Hotel Pinehurst. Secretary, N. D. Brookshire, Meridian.
- Michigan Allied Dairy Association**—Annual Convention and Exhibition, Kalamazoo, February 4, 5, 6, 7 and 8, 1924. Secretary, R. F. Frary, Lapeer.
- Michigan Dairy Boosters**—Annual Convention and Exhibition, Kalamazoo, February 4, 5, 6, 7 and 8, 1924. President, Yunker, Zipp Manufacturing Co., Cleveland, O.
- Western Canada Ice Cream Manufacturers' Association**—Annual Convention, Moose Jaw, Sask., February 6, 7 and 8, 1924.

The
Electric Weld
For 1924

Solderless

Leak-proof

No Leaks

Electric Weld Cans are water tight before they are tinned. They are tested in the black and are made water tight by accurate mechanical processes. They are made with the accuracy of a watch case. The parts are forced together by hydraulic pressure of 2500 pounds to the square inch—then interlocked or welded.

Send us your order now and assure yourself of having cans when you need them—at moderate prices.

Texans Gathering for Stirring Convention

Great Attendance Expected at Gathering of Manufacturers of the "Lone Star" State at Galveston this Month
Texas Longhorns Active in Convention Preparations

TEXAS is preparing for its greatest ice cream convention. Manufacturers throughout the state are making ready to attend the annual gathering, which will be held at Galveston November 26, 27 and 28, according to association officers. Hotel Galvez will be convention headquarters.

A program featured by addresses from men prominent in the ice cream industry of that state and leaders in research work in the ice cream industry is an attraction that has created wide interest, it is indicated by letters to Secretary A. J. White of San Antonio.

Advance preparations for the convention, as related in the October 15 issue of The Ice Cream Review, were

H. T. Pangburn, Fort Worth; George Boedeker, A. E. Pimenthal, Austin. D. J. Carithers, Wichita; Fred Peale, Kansas City, and Paul Mojonier, Chicago.

J. B. Huff, Fort Worth, president of the Texas Longhorns, advises The Ice Cream Review that his association is rapidly shaping up plans to help "put the convention over big." He expects the coming gathering to be one of the best ever held in the Lone Star state.

Entertainment features include boatrides, drives, bathing parties, dinner dances, theater and the annual initial exercises of the Texas Longhorns.

Surf Bathing at Galveston.

begun at a meeting of the ice cream manufacturers' officers and board of directors and officers of the Texas Longhorns, held at Hotel Galvez, September 29.

In addition to a business program, the directors of the two bodies drew up an entertainment program that they believe will meet with the greatest satisfaction by delegates.

The forenoon of the first day of the convention, Monday, November 26, will be taken up with registration. There will be a meeting of the board of directors at 11 o'clock. The convention will open at 2 o'clock. After the president's annual address is delivered by J. J. Sullivan of Houston, Tex., the association will hear Professor Ruehe of the Illinois University, Urbana, Ill.; J. M. Rideway, Mistletoe Creameries, San Antonio, Tex.; Prof. T. O. Walton, director of extension, Texas A. & M. College, Tex., and John L. Darrouzet, Galveston attorney.

Among others to address the convention at subsequent sessions are: Prof. A. C. Baer, Oklahoma A. & M. College, Stillwater, Okla.; W. W. Wren, Fort Worth;

The bathing party feature of the program is planned by the fact that Galveston rarely has a day when a dip in the surf is not enjoyable.

Galveston Expects Record Attendance.

The meeting last year was held in San Antonio and was a very successful one but the ice cream manufacturers of Galveston are confident that not only will attendance be greater this year but that more good will be accomplished.

It is rather fitting that this convention should be held in Galveston since the climate at this season of the year is delightful. When Galveston was first mentioned for the 1923 meeting the exponents of its cause drew attention to the fact that this was the only city in Texas or in this section of the Southwest, where there was so much ice cream consumed in December as in July. It is just possible that this is not exactly correct, for the average temperatures of these two respective months are not the same. However, their relationship is so close that the average temperature for the year runs about 56 degrees while that of the summer months will average but

R. L. Hargrove.....Texarkana, Texas.

REMEMBER THE DATES FOR YOUR STATE CONVENTION—AND BE THERE.

over 70. Freezing weather has only been experienced one time here within the past four years, which would indicate that the Galveston delegation in its zeal was not so far wrong after all.

It is a common boast that surf bathing in Galveston can be practiced with equal pleasure both in summer and winter. However, it is somewhat unusual to see local people take advantage of this state of affairs, although it is very common to see Northern tourists indulging at all seasons. The temperature of the water in winter runs around 70 degrees and it is but slightly higher than that in the summer time. Bathers stay in the water for hours without serious results.

For a great many years Galveston has been considered the leading resort of the Southwest, and this state-

modations are concerned, this convention will far pass any the association has held in the past.

There is rather a general impression among the people that Galveston is a summer resort exclusively and most of them pay little or no attention to the claim the city advances for itself as a winter resort. However, there are amusement and entertainment of all kinds there, even during the winter months. With mild temperatures and the spongy soil which quickly soaks up the heaviest rain, the golf links offer an ideal outing for the followers of this ancient pastime.

During the hunting season ducks and geese abound in all of the little sloughs and inlets flowing into Galveston Bay. Fishing, particularly of the deep sea variety, is guaranteed to give even the most hardened

Waterfront View of Galveston.

ment means no disparagement to the many other resorts located in this section, but Galveston has an established clientele and offers many varied attractions which serve to bring visitors here again and again. The railroads have co-operated by placing in effect excursion rates of an attractive nature and with the improvement of the automobile roads leading to all sections of the Southwest there has been an increasing number of automobile tourists; in fact, at the present time automobile camps are the rule rather than the exception, although three years ago very few of this type of tourist were in evidence.

Convention Headquarters.

The convention headquarters will be at Hotel Galvez which faces the Seawall Boulevard and overlooks the Gulf of Mexico. Arrangements have been made to take care of the entire delegation, or at least as many of those as care to stay, under the one roof and all convention sessions will be held there. Special arrangements have been made with the management to look after the comfort and convenience of our guests and all the local interests are confident that in so far as living accom-

modations are concerned, this convention will far pass any the association has held in the past.

The city itself is interesting—in fact, there are few in the United States which can offer as much to stimulate the imagination as Galveston. The quaint style of its architecture is unique but is easily explained when one takes into consideration the necessity which prevails here. There is an absolute dearth of hardwood trees in this delinquency is more than made up by the unusually large number of beautiful and stately palm trees which are found in all sections of the city. Oleanders thrive in the salt laden soil and bloom the major portion of the year and remain green during the entire year. The principal winter blooming flowers, however, are Hibiscus and Poinsetta, with an occasional rare flower which some enthusiast has gathered from a remote corner of the earth and is experimenting with. The Oleanders are particularly attractive and Galveston has become known almost as the home of this flower.

Oklahoma Ready for Lively Convention

Tulsa will be Scene of Oklahoma Association of Ice Cream Manufacturers' Convention November, 21, 22, 23, 1923

Skyline of Tulsa.

OKLAHOMA has had its troubles in late tumultuous months, but nothing has come up to dampen the enthusiasm of members of the Oklahoma Association of Ice Cream Manufacturers and their friends, the Wolfhounds, over the convention to be held at Tulsa November 21, 22 and 23, according to officers of these associations.

Extensive preparations have been going on for some time for this convention, and readers of The Ice Cream Review have the promise of Secretary J. B. Porter that

his home town is prepared to give delegates a warm reception and a delightful convention.

The secretary says that preparations are taking shape for a "well-balanced" affair, including both educational and entertainment features. This is Tulsa's first opportunity to entertain ice cream manufacturers of the state. They will be aided by the Wolfhounds, already famous for their hospitality and delightful entertainments.

Hotel Tulsa will be convention headquarters.

The Convention City.

The success of a convention depends to a large extent on the convention city. Accommodations, entertainment features, local and side must all be considered. And Tulsa has those facilities. Great as is Tulsa's oil industry, she has many allied industries as well. Visitors will be singularly disillusioned upon visiting the town. Instead of the usual derricks, oil tanks and hasty constructions will be the magnificent fifteen story buildings, beautiful laid parks, and handsome residences.

Hotel Accommodations.

A recently compiled list of hotels show 90 now operating in the city. The steel work on the Mayo, Tulsa's two million dollar hotel, is now up fifteen stories. When completed, the Mayo will be the largest individual building in the state of Oklahoma and will have 600 guest rooms and a total capacity of approximately

THAT HOT SPRINGS TRIP IS A BRIGHT FEATURE OF THE SOUTHERN CONVENTION.

West Virginia Association Expects Large Convention Attendance

Manufacturers of the Mountain State will meet at Parkersburg November 19 and 20

OFFICERS of The Ice Cream Manufacturers' Association of West Virginia are preparing for a large attendance at their annual convention at Parkersburg November 19 and 20, according to announcement by Secretary C. J. Jamison of Huntington.

Good topics and good speakers are promised to delegates, the secretary notifies The Ice Cream Review. Hotel Chancellor will be convention headquarters.

The West Virginia association, though not as large as some of the associations of its neighboring states, has a reputation of providing lively conventions, full of interest and enthusiasm. Visitors are extended a cordial invitation.

S. B. Haffner of Elkins is president of the association, and he expects a good attendance. J. T. Swager of Clarksburg is vice-president. The directors are: Mr. Haffner, J. H. Cline, Charleston; G. W. Shelter, Wheeling; D. B. Woods, Bluefield; A. M. Johnson, St. Albans; J. T. Swager, Clarksburg; E. E. Livesay, Lewisburg.

Parkersburg is a thrifty little city located on the main line of the B. & O. Railroad and on the Ohio River, in the midst of an oil and gas belt. It has a population of 25,000 people and is surrounded by a fine agricultural and dairy country.

Concerning the Convention City.

Parkersburg, the county seat of Wood County, in the northwestern part of West Virginia, is 373 miles west of Baltimore, 195 miles east of Cincinnati, 160 miles southwest of Pittsburgh, and 432 miles southeast of Chicago.

The 1920 population was 25,000 people within corporate limits. With industrial districts included this city is credited with a population of 35,000 inhabitants. Parkersburg lies at an elevation of about 638 feet above sea level and the average annual temperature is 54 degrees. The temperature seldom reaches 100 degrees in summer or zero in winter. The average rainfall is about 40 inches. Greatest precipitation usually occurs during June and July, and the least during September, October and November, but little snow falls during the winter.

Transportation.

Parkersburg is located on the main line of the Baltimore and Ohio from New York to Cincinnati and St. Louis. Also on the Ohio River Division of the Baltimore & Ohio to Pittsburgh and Kenova. This little city is also served by many other railroads, including the Norfolk &

Western, the Pennsylvania, and the New York & Monongahela Power and Railway Company furnishing interurban service between Parkersburg and Ma and Beverly, Ohio. Several lines of steamboats operate between Parkersburg and points on the Ohio and Kanawha Rivers, both being navigable for coal freight transportation. Boat lines operate regularly from Pittsburgh to Charleston and also to Cincinnati.

Industries, Sites, Labor, Fuel and Raw Materials.

The principal products of Parkersburg are oil supplies, shovels and post-hole diggers, furniture, porcelain, shoes, mattresses, boilers, clothing, glass-ware, machinery, building supplies, brick, refined oil and gasoline, floor tile, imitation marble.

The Afton Creamery Company, managed by Williams of Afton, Iowa, produced 5,000 pounds of butter each week, which is all put in one pound print sold in the state of Iowa. No butter is shipped in.

The creamery is a 60x34 two story structure, enameled walls and ceiling. The machinery is enameled white. A 600 gallon Jensen vat; one 300 gallon Wizard vat; one 50 gallon starter can, and one pound Perfection churn is in use daily. Electric operate these machines is obtained from an adjacent town. In the event no current is obtainable, a steam engine can be put into work in just a few minutes.

This creamery was at one time a Farmers' Cooperative plant, but five years ago the defunct company was taken over by Mr. Williams.

CALIFORNIA ASSOCIATION.

The directors of the California and Southwestern States Ice Cream Manufacturers' Association have requested me to ask you to attend the Pacific Slope Show, to be held October 29, to November 3rd, 1921, in Oakland.

The California and Southwestern States Ice Cream Manufacturers' Association are obligated in many ways to Dr. Roadhouse and Prof. Turnbull of the University of California, who have been untiring in their efforts to advance the dairy and ice cream industry of the state.

Dr. Roadhouse and Dr. Turnbull are vitally interested in the Pacific Coast dairy show and your desire to ask that you show your appreciation of their work by attending the show.

Fraternally yours,
C. J. ALFRED, President

S. B. HAFFNER, President.

Pennsylvania and Jersey Manufacturers to Meet

Interesting Program Being Shaped up for Seventeenth Annual Convention

THE Association of Ice Cream Manufacturers of Pennsylvania and New Jersey will meet November 13, 14 and 15 at Altoona, Pa. Officials expect a large attendance. This will be the first state convention to follow the meeting of the national association.

The association formerly comprised only the manufacturers of Pennsylvania but now also include New Jersey manufacturers. E. E. Rieck of Pittsburgh is president of the association, succeeding the late Robert Crane of Philadelphia, whose recent death ended many years of association service in the Pennsylvania industry.

E. E. RIECK,
President.

James W. Neuman, secretary of the association, has issued a tentative program which indicates that the association will have its usual live, interesting, constructive meeting.

If Mayor C. E. Rhodes is on hand to deliver the address of welcome

President Rieck then will open the seventeenth convention of his association and deliver the presidential message.

Secretary Neuman advises The Ice Cream that he hopes to have cost accounting thoroughly covered. The tentative program provides for reports of committees following the president's address after which Glenn F. Cowan of the Arctic Ice Cream Co., Detroit, will speak on "Iceless Cabinets," giving practical demonstrations. An address by Dr. Kimberley, Dairy Laboratories, New York City, is scheduled. N. W. Ayer will speak on "Why Should Ice Cream be Nationally Advertised." Thomas J. Stewart, president of the Salesmen's Club of The Association of Ice Cream Supplymen, will speak on "Friendly Competitive Salesmanship." "Developing initiative will be the subject of Oliver S. Jordan, president of the supplymen's association.

J. W. NEUMAN,
Secretary.

Other speakers will be: O. E. Williams, U. S. Department of Agriculture; Hon. James Foust, Pennsylvania, director of food; George R. Moffitt, bacteriologist for city of Harrisburg; and W. R. Jennings of the Parker-Brawner Company. There will be open discussion.

Social features will include the following: ride for the ladies to the home of Charles M. Loretta, Pa.; Theater party to musical comedies; ladies as guests of the Pennsylvania Manufacturers' association; matinee and theater party, the ladies as guests of the Central Pennsylvania ice cream manufacturers.

The annual banquet will be featured by singers, vaudeville acts and other entertainment.

You can't afford to miss a single copy of The Ice Cream Review. Did you send in your renewal?

ILLINOIS AND JERSEY MANUFACTURERS WANT TO BREAK ALL ATTENDANCE RECORDS THIS MONTH.

Mighty Outpouring of American Ice Cream Manufacturers

Five Flags Represented in America's Great Ice Cream Trade Classic—
New Orleans Gets Next Convention

CLEVELAND, O.—October 30—(Special to The Ice Cream Review). Floodgates of American highways and byways opened upon Cleveland the week of October 22-27, when the rank and file of the ice cream industry passed in review before the most elaborate trade exposition in the history of the "rose of the dairy industry."

This city, the stormiest point on the great lakes, was a storm center in more than one way during ice cream week. Manufacturers traversed the length and breadth of the land to make this port of entry and keep their appointment with opportunity.

Stormy weather greeted them upon their arrival. But it did not dampen the enthusiasm of the visitors, who walked wet streets virtually the whole week to attend convention sessions, visit the exhibits, and in the evening to take their fun and frolic at the various social and entertainment affairs.

Ice cream men who have attended national conventions for many years agreed that in point of all-round interest as well as general attendance, the 1923 convention reached a high-water mark. Not only was the attendance greater but it was more representative. The South and the Southwest had greater representation than ever before.

Vice-President Morden Neilson led more of his friends from Canada than ever before attended an American convention from the old dominion.

Five flags were represented at America's greatest ice cream trade classic, not counting the Stars and Bars of Dixie, represented by a veritable deluge of the South's manufacturers and their fair ladies.

The Stars and Stripes and the Union Jack faced convention delegates when President Charles G. Morris dropped the gavel opening the twenty-third annual convention of the National Association of Ice Cream Manufacturers.

Two hours earlier Oliver C. Jordan, president of The Association of Ice Cream Supplymen, opened the Second National Ice Cream Exposition to the strains of

"My country 'tis of thee,
Sweet land of liberty,"

and then told the gentlemen assembled how proud he was of the ice cream industry, its exposition and the outlook for future growth as evidenced by the magnificent exposition provided and the wide interest shown in it by manufacturers of every state.

Ice cream royalty—Left to right:
Retiring Vice President Morden Neilson of Canada, H. L. Edwards,
an English visitor, and Convention President
Charles G. Morris, New Haven.

The exposition, according to Roberts Everett, secretary-manager of The Association of Ice Cream men, was 40 per cent greater than last year's show.

Geographically and in variety of products, most representative. Attendance and general were up to the fondest hopes of officials. Ice cream manufacturers of uttermost points, many of them with the enthusiasm spread by visitors, were "packed up their trouble in the old kit bag" and a week with Alice in ice cream wonderland. There were 213 booths in ninety thousand square feet of Machinery and supplies estimated in value, by exhibition officials at 150,000 dollars, were exhibited. A larger exposition it would be necessary to hold in a larger hall, which may be available next year if land officials carry out their plans to double the size of their Public Hall by building an addition.

Evidences Growth of Ice Cream Industry.

The exposition fairly bespeaks the growth of the ice cream industry which in itself is a trade revolution such as to delight the heart of every American who has watched this industry emerge from humble beginnings to become one of the nation's leading trade pursuits.

Probably nothing except the automobile industry could eclipse the ice cream trade pageant. In its description. On display was every product entering into the production of the "frozen beverage." Nearly all of the leading supply firms had exhibits. Many newcomers had displays. Many of the leading ice cream houses were disappointed in their efforts to secure space at the eleventh hour.

* * *

Record Convention.

THE twenty-third annual convention of the National Association of Ice Cream Manufacturers easily proved to be the best ever held by that organization. Speeches featured the sessions, which were largely attended. Ushers were kept busy at every session who showed that they have made an earnest study of the ice cream trade problems were on the program had interested audiences. The discussions brought about lively debates. The interest shown was most marked. The convention hall in the Hotel Cleveland was crowded at every session. Many delegates listened to speakers on their feet, in spite of heroic efforts of ushers to provide chairs for all.

Long after the last session was over and most delegates were on their way home, the 1923 convention program came in for much praise. The program covered every angle of ice cream manufacturing production. The order of the program showed that much thought had been given to linking up subjects and leading from topic to topic as they best inter-related. Official giving Secretary N. Loewenstein great credit for an excellent program when the trains were taking the remnants of the great ice cream army at the close of the week.

To say that delegates were royally entertained was to put it mildly. Cleveland manufacturers extended themselves in exemplifying "Buckeye hospitality."

Sure of BIGGER WINTER GALLONAGE

is a real Eskimo Pie year. Ice cream manufacturers have stopped experiment, and are banking on the demand for Eskimo Pie. That's why one manufacturer sends an order for a million wrappers for a year. Another asked for half a million—clear down line to hundred thousand orders.

There are no ifs or ands about it. The ice cream manufacturers of the country are concentrating on one name, one size and one plan for bigger winter gallonage. The public knows and likes the one and only Eskimo Pie. It is easier to sell than compete against it.

1923-24 Selling Plan Now Ready

A proven plan—full of brass tack facts—no theories. Shows actual cost of production—cost of Eskimo Pie wrapper, cost of wrapping, cost of operating. It shows actual successful methods used by manufacturers,

large and small, which increased winter gallonage and made profits right from the start.

With this complete plan you can start the season with a rush and mark the winter on the credit side of the ledger. Think it over but don't forget to put it over. Now is the time. ACT!

Fill out, cut out and send coupon to-day.

THAT HOT SPRINGS TRIP IS A BRIGHT FEATURE OF THE SOUTHERN CONVENTION.

Association of Ice Cream Supplymen long famed for its lavish entertainment, overstepped all bounds in providing diversion for the ladies and gentlemen who traveled long distances to verify The Ice Cream Review's reports that great profit was in store for all who would attend the national convention exposition. They were convinced of the accuracy of these reports, if enthusiasm may be taken as evidence.

It was a stormy affair. That best describes the National Ice Cream Exposition. Manufacturers stormed the city of Cleveland from all sides. Special trains bore delegates from all parts of the country.

International Color.

THE opening of the convention found impressions aroused over the cosmopolitan aspect. The international color was heightened as the convention progressed and the convention president found the opportunity to present delegates to the World's Dairy Congress from England, Belgium and Canada. Visitors from South American countries also were on hand to study the methods of the country that has led the way in the development of the ice cream industry. For the first time in the history of national ice cream conventions, delegates heard languages different from colloquial

American speech. An Englishman, H. G. Edwards, London, told the delegates of the status of ice in his country, employing choice English, pure and filed to do so. Louis Greenens of Gands, Belgium, conveyed the greetings of his country, giving American novelty of hearing a diplomatic language spoken. Edwards translated that speaker's French.

Cleveland was confronted with an embarrassing situation. This city was forced to divide its host with the mighty host of ice cream manufacturers. Lloyd George, former British premier and idol of English masses. Early efforts to induce the Welshman to address the ice cream manufacturers without avail. But Cleveland played its roll well. Ice cream men were not neglected.

The manufacturers felt compensated for Lloyd George, who was ably counterparted by Mr. Lloyd George, who is head of England's greatest ice plant, and Lloyd George is most striking.

Every state in the union was represented. Carolina, with fourteen delegates, led the Southern delegates in attendance. Tennessee was a close second with eleven delegates, after which came Arkansas, manufacturers will entertain delegates to the Southern convention this year. The luncheon and conference of the Southern delegates, held at Hotel Cleveland on the second day of the convention, was a distinctive feature. Sixty-five Southerners were present.

Ohio, Pennsylvania and Illinois led the Northern representation.

The convention consumed four days. The sessions were so arranged as to enable manufacturers to visit exposition booths each day. This opportunity was seized with great enthusiasm.

Every evening was taken up with entertainment features. The Association of Ice Cream Supplymen broke the ice with an informal "get acquainted" session on the first evening of the convention. It was held at Hotel Cleveland. The supply association also presented vaudeville features for the annual banquet of the National Association of Ice Cream Manufacturers at the Winton Hotel the second evening. It was the largest attended banquet ever held in Cleveland, with more than 2,000 ice cream manufacturers and their families sought accommodations. The banquet overflowed into extra floors of the hotel. Entertainment features were most were in the nature of a three-ring circus, it was necessary for the performers to repeat their acts in different parts of the hotel. Cleveland newspapers commented upon this remarkable banquet.

Suppliment at Masonic Temple the third evening was most enjoyable. There was a large attendance.

The high light of the entertainment program was reached the fourth evening of the convention when the supply association staged its remarkable "danse diable" at the Masonic Temple. This event will linger long in the minds of the guests.

The ladies suffered not a dull moment in Cleveland. There was a most interesting entertainment program for them. Mrs. L. B. Cummings, wife of the assistant secretary of the national association, handled the ladies' entertainment program most ably.

Opening Session.

THE opening session of the National Association of Ice Cream Manufacturers was late in getting away, President Morris calling the body together at 10:30 o'clock in the ball-room of Hotel Cleveland, which was greeted by a large audience.

The president introduced Mr. Holcombe, who presented the mayor of Cleveland in extending the welcome. The response was by F. N. Martin, wood co., Spokane, Wash. The president's address followed.

President's Address

THE past year has had no very high spots in the history of this organization, and if the saying is true as applied to nations, "Happy is that nation which has no history," it is certainly true as applied to an organization such as this is.

The several matters that were of more considerable moments last year have, it is true, carried over into this year. The suit of the American Conservation Corporation and the Heathized Products Company against a group of members of this association has not yet been tried in court. Such matters always are tedious in their delays. A lawsuit is a contest which is waged under a code of very technical rules, commencing with rules as to the procedure to be followed in filing the original complaint, and hedged about with more rules at every step from answer to trial and judgment. While it seemed probable that

CHARLES G. MORRIS

the case might have been thrown out of court on technicalities some months ago, the executive committee in discussing the matter decided that it was to the advantage of the industry as a whole to have it tried out on its merits. We hope that it can soon be assigned for trial.

Eskimo pie and its cousins, the various chocolate-coated ice cream bars, have apparently become a standard portion of the ice cream manufacturers' seasonal business. As an association we are deeply interested in whatever new development brings our membership wider business opportunities. It is not the duty of the organization to pass on the relative merits of the several inventions that serve as building factors for the industry, or the machinery and supplies that serve as tools and materials for our use. It is only when and if the owners of some one of them may trespass on trade ethics in advertising or promotion, or introduce harmful features which react on the ice cream industry as a whole, that the association may properly become involved in any controversy concerning them.

The complaint, made by this association of the attempt of the Smith-Kirk people of Toledo to misappropri-

ate the popularity of the chocolate coated ice bar to their own use in promoting and advertising candy bar containing no ice cream, but using the "ice cream" on the label, was brought to a hearing before the Federal Trade Commission on October 13. The result has not yet been published. Several similar cases are waiting for the outcome of this one.

The committees of this association have done a large volume of work this year. The new vigilance committee has been in solving difficulties in several cases which have been referred to it. It seems wiser not to go into the details of any of the matters which this committee has handled. The very purpose of having such a committee is to smooth over difficulties by friendly and delicate negotiations. Publicity would tend to produce harm rather than good in such matters. Membership on the vigilance committee carries with it a self-sacrificing obligation and the acceptance of an assignment to it is a service which cannot be too deeply appreciated by the membership.

We have not had as yet a satisfactory return on our questionnaire on standards. The tabulation of the results would be immensely valuable. The tabulation of the results by a slender minority may be somewhat interesting, but it is lacking in the value which a complete poll of the members might give to it.

The Committee on Uniform Cost Accounting has done a large volume of work over a series of years. There is not a member of this association who does not benefit his business by utilizing some part or all of the work. To many of us there is a bit of mystery about the accounting system of any sort. We naturally are suspicious of an imperfect system that we have developed for ourselves, and therefore understand. It is only as we try to realize that the accounts of a business are the life of that business that we sense their real importance. An individual with a bad memory or a poor name may succeed, but he is severely handicapped as compared with an individual who has a really good memory. The same is equally true of a business and its accounts.

In conclusion, I want to thank all of our members for the cordial response we have had to our claims we have made on their time and energy in association matters. The strength and the value of our association to its whole membership has depended on

Lost during year

Total state association membership Oct. 1, 1923.....

Since October 1st, when the books for the fiscal year 1923 were closed, we have secured eight new active members and collected \$925.00 for dues, the greater part of this being from members who were in arrears.

General Report.

During the period covered by this report, 10 Bulletins were sent out, also a number of circulars, covering a very wide range of subjects of practical interest to ice cream manufacturers.

Bulletin No. 60 contained a tabulation of results

tained from a questionnaire submitted to the members on depreciation for ice cream manufacturers as reported at the 1922 convention by the cost accounting committee.

Bulletin No. 61 was entitled "Taxability of Surplus of Corporations" under Section 220 of the Revenue Act of 1921, and gave excerpts from a decision rendered by counsel of the National Association of Manufacturers on this important subject.

Bulletin No. 62 called attention to a treasury decision regarding claims for refund under the Income Tax Act of 1921, as well as giving definitions and standards on

condensed, evaporated and concentrated milk as promulgated by the secretary of agriculture, upon recommendation of the joint committee on definitions and standards. Attention was also called to the new steel engraved membership certificates being issued by the association. This bulletin was accompanied by the following enclosures:

Copy of Code of Ethics adopted at the 1922 convention: A pamphlet entitled "Depreciation—It's Treatment in Production" (issued by the U. S. Chamber of Commerce.)—Copy of a pamphlet entitled "Overhead in the Ice Cream Industry" (published by the Illinois Association of Ice Cream Manufacturers.)

Bulletin No. 63 called attention to the fact that the express committee had filed a formal complaint before the Interstate Commerce Commission, asking for a reduction on the estimated billing weight on interstate shipments of ice cream from 115 pounds to the old basis of 100 pounds on 5 gallon shipments. A questionnaire accompanied this bulletin asking for certain information to aid in the preparation of our case.

Bulletin No. 64 informed the members that some sessions of the World's Dairy Congress would be held at Syracuse in connection with the National Dairy Show and that matters of interest to the ice cream industry would be discussed. Members were also asked to send in suggestions for a slogan which might be adopted by the association. A copy of the constitution and by-laws revised to October, 1923, was enclosed with this bulletin.

Bulletin No. 65 was a questionnaire prepared by the committee on standards, asking for opinions of members regarding an ice cream standard.

Bulletin No. 66 contained a questionnaire similar to that sent with Bulletin No. 63, urging the members to furnish information on traffic matters, that our classification case against the express companies might be properly prepared.

Bulletin No. 67 entitled "A Statement from the Cost Accounting Committee," called attention to the unusual service rendered by some ice cream manufacturers without adequate returns.

Bulletin No. 68 contained a partial list of members suspended for non-payment of dues.

Bulletin No. 69 was an announcement regarding the 1923 convention and urged members to make hotel reservations. Reservation blanks were sent out for this purpose.

Bulletin No. 70 was accompanied by a communication from the secretary of commerce urging manufacturers to co-operate with the railroads, particularly on the advance storage of winter coal, the loading of cars to full capacity and prompt discharge of cars. This bulletin again urged upon the members to return the questionnaire on standards. A preliminary canvass of ballots cast in Referendum No. 41 of the U. S. Chamber of Commerce on the "Report of the Committee on Trade Associations" was also sent.

Bulletin No. 71 referred to the progress being made on the convention program and again asked for the return of standard questionnaires. A letter from the acting secretary of commerce, further urging manufacturers to secure advance storage of coal before the heavy demands of the fall and winter seasons, was also enclosed.

Bulletin No. 72 called attention to some of the more important subjects to be discussed at the coming convention, and urged members to make their hotel reservations that they might be properly accommodated.

Bulletin No. 73 referred to the reduced rate round trip excursion tickets being sold for the World's Dairy

Congress, National Dairy Show and Cleveland tion.

Bulletin No. 74 referred to the coming convention procedure to be followed in securing reduced rates, and was accompanied by a copy of the convention program.

Bulletin No. 75 referred to a treasury amending regulations regarding tax on beverage constituent parts thereof under the income tax. Reference was also made to a Bureau of Internal Revenue ruling on the auditing of income tax returns. This bulletin was accompanied by a pamphlet entitled "Acceptance and Installation of Uniform Method of Cost Accounting," prepared by the Fabricated Ice Cream Division of the U. S. Chamber of Commerce.

Many Inquiries Prompted.

These bulletins prompted a large number of inquiries for additional information on the many subjects which they referred. The volume of our correspondence has increased tremendously during the past year. Increased correspondence, however, is particularly gratifying, indicating, as it does, appreciation of the services of the secretary's office is rendering.

A review of the correspondence in our files indicates that a voluminous number of letters on various subjects were written during the year, in addition to circular letters, requests for payments of dues. Many of the communications received from our members referred to matters which necessitated a large amount of detail work to supply the desired information.

A new field of service for the industry was opened up by the association during the past winter, when we contracted with a legislative service bureau to supply the secretary with copies of all bills introduced in the present state legislatures which might in any way affect the ice cream manufacturer. These bills ran into hundreds and were of a varied nature, applying not only to ice cream subjects but to milk, condensed milk, co-operative measures, taxation and kindred subjects. Officers of state associations were promptly notified whenever any legislation was offered in which members were in any way interested. The progress of all such bills or resolutions was closely followed by the secretary. To illustrate the value of this service, a few days ago I received a wire to the effect that a bill introduced in the Arkansas legislature imposing a tax on the sale of ice cream. This bill had an emergency clause attached, making it immediately effective upon the event of its passage. Your secretary wired at once to the president and secretary of the Arkansas association, informing them of the introduction of this bill, and pointing out the danger, not only to the manufacturers of the state of Arkansas, but the precedent which it created for other states, should a bill imposing a tax on a food product such as ice cream be passed. As a result, prompt action was taken by the Arkansas association to head off this bill and advices just received indicate that the proposed tax on ice cream has been stricken from the bill.

I attended the convention of the Illinois association at Chicago, Ohio, Michigan, Wisconsin and Minnesota associations also held two special meetings of the Indiana association and also attended a meeting of the St. Louis manufacturers' association with reference to some ice cream bills pending before the Missouri legislature. I made several trips to St. Louis in connection with convention arrangements, a trip to Toronto, Ontario, in connection with rate matters affecting our Canadian members. I also attended a rate case hearing pending before the Interstate Commerce Commission, and assisted our attorney in this matter, as well as in our case

case wherein we applied to the I. C. C. for a reduction on the estimated billing weights of 5 gallon ice cream shipments when moving by express from 115 to 100 pounds. I also attended the convention of the American Dairy, Food and Drug Officials, at Duluth, Minn.

A persistent campaign for an increased membership has been kept up during the year, as a result of which 76 new active members were secured prior to the closing of our books October 1st, and eight since that time.

I take this opportunity to thank the officers and members of the association for their kind co-operation during the past year.

October 1, 1923.

N. LOEWENSTEIN, Secy.

* * *

The international color of the occasion was injected the second day of the convention, when president Morris halted the regular order of procedure long enough to introduce for speeches H. L. Edwards, London, Eng.; H. E. Van Norman, president of the World's Dairy Congress, and Louis Greenens, Gand, Belgium.

Mr. Edwards, after telling the Americans of England's late start in ice cream manufacturing, then proceeded to give his audience some good, practical business points on keeping up with production costs, points such as followed in his plant, he said. He told his audience that every detail of cost of ingredients, labor, general expenses of delivery, etc., is kept up with by this company. When he was seated president Morris asked all Americans who knew these facts about their plants to rise. There was no response. Louis Greenens said the ice cream industry is just starting in Belgium.

He is head of the Gand Dairies, Belgium. He intends to open a small ice cream manufacturing plant in his city soon.

P. P. Miller, Kirk Maher Co., Watertown, Mass., opened the second session, October 23, with an address on "Interurban Packing Routes."

His speech appears on page 82 of this issue.

Mr. Miller was followed by D. M. Dorman, Creamery, Los Angeles, who spoke on "Truck vs Route Salesmen."

Harry J. Tait, Tait Bros., Springfield, Mass., gave the manufacturers some interesting information in his speech on "Reducing Delivery Cost by Reducing Delivery Service." It was a most practical view of one of the industry's greatest trade evils.

"In August, 1922, we operated two Ford trucks, requiring four chauffeurs, to deliver 7,623 gallons of ice cream," said Mr. Tait. "In August, 1923, we used one two-ton truck, one Ford half the time, and two wagons, requiring three and a half drivers, to deliver 8,178 gallons. The real costs are not available, since our records for 1922, are not complete, but calculating that minimum, we find .09950 per gallon in 1923 and .1575 in 1922—a saving of .7557 per gallon. It is unfortunate that the period in which data could be collected was just as the costs given are only indicative and not final. This year's operations will result in dependable statistics, but they will not be available until next spring.

"In the meantime, however, the consumption of fuel and ice has been reduced one-half, the amount of ice given away by drivers has been reduced to practically nothing, and we firmly believe that the reduction in price per gallon in price will be more than met by the reduction in service costs. We are looking forward to the winter months when our customers, instead of having their cabinets iced every time the drive calls, will use ice only as actually needed. While no definite savings have been obtained for the cost of icing in the winter months, it is certain that the cost is considerably less than the 10c additional we used to get. If, in the winter to that, we can operate at a 7½c less cost compared to a 10c less price during the summer, we are bound to be taking the twelve months together."

Prof. Ben H. Petty, associate prof. of highway engineering, University of California, spoke to the delegates on "Reducing Trucking Costs." He prefaced his remarks with an apology for "not more resembling president Morris so much as better look the part of a college professor."

The speaker was amazed over the lack of detailed data on his subject among men in classes of business which necessitate the use of fleets of motor trucks. He kept the most detailed records of the cost of things entering into their business. He fixed the headings that go to make up the cost of operating a truck under two headings, "fixed" and "variable costs," which were subdivided into thirteen divisions, including interest on investment, taxes, license fees, garage overhead under the heading of fixed costs, and under the heading of variable costs he listed depreciation, drivers' wages, gasoline or electric current, lubricants, repairs and overhaul.

He declared fixed costs to be an item frequently neglected in cost estimates. He said it was the single item in operating cost. He did not express his opinion as to whether it is best to base depreciation on a "mileage basis" or "age basis."

"Those who use the age basis," he said, "place more emphasis on the fact that a truck depreciates to a certain extent."

Sealright *Liquid Tight* Paper Containers

BUILD Year-Round, Volume Sales
with these

POPULAR SEALRIGHT PACKAGES

OF YOUR ICE CREAM

SEALRIGHT SUNDAE SIZE

Build bigger ice cream sales with this real selling feature—your ice cream packaged in Sealright $\frac{1}{4}$ pint Sundae Size Containers. Top of cream may be coated with any popular flavor of fruit dressing. A sturdy slip cover permits hardening up-side-down, so as to keep flavoring where it belongs. This ready-to-serve sundae makes a hit with dealers because it sells fast, serves fast and pleases customers. Many people buy them by the dozen for parties, etc. Many dealers retail them for 10c.

SEALRIGHT $\frac{1}{4}$ PINT, FLAT

Get \$1.60 for your ice cream packaged in Sealright $\frac{1}{4}$ pint Containers (flat size). Places your ice cream on the same rapid, profitable selling basis as chocolate bars, or any other "buy it and carry it away with you" commodity. Especially salable in public places where many people must be served quickly. When sold for 10c, with a paper spoon clipped under the crimp on the cover, a tremendous sales volume is possible.

SEALRIGHT $\frac{1}{2}$ PINT SIZE

Build and assure a year-round, carry-home business by packaging your ice cream in Sealright $\frac{1}{2}$ pint Containers. Sells to consumers for 15c, a popular price—a price within the reach of all. Here is a real chance to build up your plain flavor business, and create a tremendous sales volume for popular priced ice cream. Both manufacturer and dealer make a nice profit. The price, plus the size, places your product within the reach of multitudes. Remember, more people have 15c to spend for a carry-home package of ice cream than 30 or 60 cents.

Sealright containers may be filled direct from freezer,
or by Sealright Ice Cream Filling Machine

Write for samples of these popular Sealright sizes. Also for booklet BIGGER ICE CREAM SALES, and samples of Sealright window pasters, transparency, and other free advertising tie-up material that helps you cash in on Sealright national advertising in The Saturday Evening Post and Good House-keeping.

MENTION "THE REVIEW"—IT IDENTIFIES YOU.

whether it is operating or not, also that it is easy to distribute the depreciation charges in this way."

His speech will be published in an early issue of The Ice Cream Review.

Dr. H. A. Ruehe, dairy husbandry department of the University of Illinois, spoke on "Research and What It Means to the Ice Cream Industry."

Charles J. Stewart, Decatur, Ill., was assigned the subject of "Some Troubles of the Smaller Manufacturer." The speech was presented at the close of the second session.

This speech warned the delegates that the perilous point in an ice cream manufacturer's business career is when he reaches the 50,000-gallon mark and seeks to go higher. It is at this stage, it was pointed out, that the manufacturer must give careful attention to credit, collections. At this stage the competitor's co-operation is especially valuable.

At 2:00 o'clock the afternoon of that day the delegates inspected the exposition hall. The annual dinner of the association was held at the Winton Hotel that night, with the supplymen furnishing the entertainment.

Third Session.

THE third session was opened with a speech by A. P. Schneider, president of Jacoby Co., Allentown, Pa., on the subject of "A Cabinet and Service Charge and Why."

"If the ice cream industry will establish a new system of charging, whereby the dealer pays a cabinet and service charge, separate and apart from the cost of ice cream, it is self-evident that the number of holes would immediately become automatically controlled and kept at a minimum by the dealer himself, since it would be to his financial interest to keep the number of holes

at a minimum," said Mr. Schneider. "An additional cost to the dealer of a standard charge per gallon, therefore, make each gallon of business profitable to the ice cream manufacturer."

"The result in net cost per gallon to the dealer then vary from \$1.66 to \$1.02 per gallon, depending upon whether or not he used three gallons per hole, or twenty gallons per week per hole."

"Where there used to be one confectionery a given block we have now five and six 'places' ice cream is sold. Now mark this, that no matter the increased consumption has been, it has not increased so much for that block that it could be divided into parts, each of which would equal the gallonage of the original single store sold."

"As a result of this false expansion, manufacturers have had to buy more trucks, more cabinets, they had more repairs, and more grief all around. Yesterday in a given area they had a one thousand gallon cabinet with a three hole cabinet; today in the same area they have six six-hole customers selling not to exceed one thousand gallons. By dividing the three holes by one thousand gallons, we have the result of 333 per hole per year. By dividing the six six-hole cabinets into thirty-six holes, into the two thousand gallons, a result of a fraction over fifty-five gallons per hole. By now dividing the 333 gallons by the 55, you will see that the cost per hole has increased one-half times in proportion to the number of holes of ice cream sold."

"Do not fear the loss of these 'Ice Customers' they are the parasites of your profits. It is safe to say that on the average about 80 per cent of your gallons is sold by less than 50 per cent of your stops. Is this the profit? Is it had from the 50 per cent of stops selling 80 per cent of your output? Yes, that is the answer. And furthermore, it is safe to assume the gallonage formerly sold by the 'Ice Customers' pass through the cabinets which you continue to use, thereby increasing both dealer and manufacturer's sales, and by so doing increasing your ultimate sales. Your ice cream will always be fresh, and therefore of better quality."

F. Hovey, Schenectady, president of the Association of Ice Cream Manufacturers of New York, spoke on "A Fundamental Change in Service Policy," and said a change is needed to "correct an ill that we have developed."

He said free service made it possible for the ice cream industry to maximum gross sales, and was good for the ice cream industry that there be a retail customer handling the product near the consumers. But with the reaching of the point where there are two or three retail dealers close to every customer.

"When we have 600 stores selling no more than was formerly sold by four hundred stores, the expense of serving the 200 stores extra is going to be paid for," he said. "We have suffered from a decrease in sales per customer, meaning that the maintenance of a certain volume of business has required more cabinets, more ice, more salt, more trucks, more labor. We owe it to ourselves to conduct our business economically and efficiently."

"Theoretically, it would appear that we should establish a proper base price for ice cream, when ready to use our platforms, and then charge separately for each item of service we give, however, this would require great detail, and probably considerable friction with our customers, and therefore, would be more statistically than some other system. A service charge

cabinet hold, per week, seems to be fundamentally sound.

"Service costs are usually spoken of as including ice, salt, cabinet expense, horse delivery and auto delivery. Usually a little less than one-half of our delivery equipment is given up to the carrying of ice cream, itself, and there seems to be no good reason why this part of our service cost should be included in our service charge to be paid by our customers, as that part of our service cost which is applicable to the delivery of ice cream itself, would not be reduced by increased sales per cabinet hold.

"It would seem sound logic that our service charge should not exceed that part of our cost which covers cabinets, ice, salt and the delivery and packing thereof, in other words, it would seem that our service costs should cover those items, the cost of which would be reduced by the efficiency resulting from a service charge, and not that part which would cover the cost of delivery of ice cream, which would remain a fixed cost, per gallon."

H. H. Littlefield.

"Our definition of 'service charge,'" said H. H. Littlefield, Detroit, speaking on 'Service Charges as an Economic Factor,' "is a necessary charge made to small customers to enable us to show a small profit on ice cream sold to them. Theoretically the definition should read, the same profit on every gallon of ice cream sold."

He said the cost of packing has climbed every year and has in many cases "eaten up all the profit and often shown a loss."

"Under the system of selling ice cream for a set price per gallon including packing service until the ice cream was consumed, the cost of packing has climbed steadily, year by year, until in some cases it has eaten up all the profit and in some cases shown a loss," he said.

"This has become apparent to every manufacturer who keeps an ice record for each of his customers.

"Large numbers of small retail dealers have carried too many flavors and sold only a small quantity of each, thereby increasing the packing cost and cabinet investment per gallon. The difficulty has been further increased by the increase in number of retail dealers in advance of the per capita consumption.

"We have had, in our brief experience, customers who used as little as 20 pounds of ice per gallon and others who used as much as 120 pounds of ice per gallon. Such a situation brings up the question: How much ice can we afford to give in selling a gallon of ice cream? From a theoretical standpoint, the ideal way to

meet this situation is to sell ice cream as one item, packing service as another item. The customer pays for exactly what he gets. This seems to be the only way to make every gallon of ice cream the same profit. This has, however, always seemed a drastic change and too difficult in detail for action.

"Due to differences in state standards, selling prices of milk products, ice, salt, transportation and local conditions affecting the price and cost of ice cream, every manufacturer has his own individual problem in deciding how much ice he can use in packing a gallon of ice cream.

"Under our own conditions, we decided that we could go as high as 40 pounds of ice and salt per gallon of ice cream. We decided further that we would have great difficulty in charging for ice over this figure, due to necessity for exact weighing and large increase in clerical work. As a result we adopted a flat rate service charge based on the ice cream sold to the dealer for a weekly period. This charge is \$1.00 for every cabinet compartment in use by a dealer who buys less than 16 gallons per week. If he buys 16 gallons or over in the week, no charge is made. Sales to the dealer are compiled every week and in case they are less than 16 gallons, we bill him \$1.00 for each cabinet compartment he has in use. This line of demarcation is sharp, but it has the advantage of simplifying clerical work.

Reduces Cabinet Investment.

"This charge has the effect of making the customer careful not to ask for more cabinets than he needs, which reduces our cabinet investment per gallon. In addition to giving us payment in a rough way for excess ice and salt. It enables us to remove cabinets and discontinue service promptly from customers when the sale season ends with the advent of cool weather. A dealer is quick to see that it does not pay him to continue when his sales have fallen below a certain point. He asks to have service discontinued, when he no longer wanted all winter service which was a loss of us.

"As a result of increased packing cost during the last few years, some manufacturers have felt that they should not serve a customer who does not buy enough ice cream to show a profit. A service charge makes it possible to serve this class of customer at a profit. By so doing, ice cream is made more easily profitable by the buying public. Furthermore, the small customer this year may be a good customer next year.

"There are probably few of you who do not find it difficult to serve some customers at a loss and the net result on all business is the profit from the good customers less the loss on the small ones. A service charge enables the small customer pay his own way.

"As a result of this plan we have been able to serve several hundred small customers at a profit, ones which we would otherwise have lost money during the weeks of the season. It has enabled us to sell 10 per cent more ice cream at a profit during the year.

"We believe in the economic value of a service charge and while we know that many objections have been made to our present plan, we offer our one season's experience for your consideration."

F. E. Wheeler, Producer's Dairy Co., Brockton, Mass., gave "A Summary of Service Costs."

J. E. Dunne, Hazelwood Ice Cream Co., Portland, Ore., discussed the "Advisability of a Weekly Service Charge" for the delegates but was unable to attend personally deliver his address.

"In 1912 one of the wars was on in our community."

Heathization—Getting Back to Nature

ALL life on this planet is absolutely dependent upon the existence of from three to four parts of carbon dioxide in every ten thousand parts of air. Remove this tiny percentage, and life would be extinct within a year—just as soon as the food supply should be exhausted. For all food is built up out of carbon dioxide from the air and moisture and mineral salts from the soil. The plant leaf breathes just as the human does. Through the tiny pores on the underside of the plant leaf the carbon dioxide from the air passes. There, under the influence of direct sunlight acting upon the chlorophyll of the plant leaf, the carbon dioxide is transformed in Nature's own laboratory into food. The moisture and mineral salts are drawn from the soil and combined with the carbon dioxide. These myriads of food factories a beneficent Nature has provided in order that life should exist upon this planet.

The cow eats the blade of grass and transforms it into butterfat or meat tissue. No matter what the human family eats, the food owes its origin in the beginning to the combination of direct sunlight, chlorophyll, carbon dioxide, moisture and mineral salts.

The carbon dioxide is compounded into food and stored within the apple, in the nut or in the wheat berry, and then a wise Nature protects these foods from air with the skin, the peel, or the bran coat. When you break through Nature's protective peel, the apple turns brown, deterioration starting in at once.

Nature employs her food atmosphere, carbon dioxide, in other ways. We call milk our ideal food. Milk, when drawn fresh from the udder, contains 10 per cent of carbon dioxide by volume. The carbon dioxide functions in milk to keep a perfect emulsion, to inhibit bacterial growth, to preserve the vitamins, to stimulate digestion and to improve the flavor.

A wise Nature also provided that the bubbles in bread should be filled with carbon dioxide through the natural fermentation, due to

yeast. When Nature puts bubbles in bread, she singles out in her wisdom carbon dioxide for this natural process.

Carbon dioxide is indispensable to the fountain man. Take a glass of ginger ale and pour it from glass to glass a few times to replace the carbon dioxide with air. The ginger ale has lost much of its palatability, due to the fact that carbon dioxide, the natural atmosphere for beverages and foods, has been replaced by air.

For generations we have known that air is food's most destructive enemy with its by-products of oxidization due to air-contact. That is why the housewife so carefully seals her foods air-tight in order that they shall not spoil.

Food chemists, recognizing the destructive action of air, endeavored to work out a solution by vacuum means. Attempts were made to churn butter in a vacuum, because ordinary butter contains 10 per cent of air. Coffee and other products have been sealed in a vacuum to prevent the access of air, which deteriorates the flavor. Today food products are sealed in cans in an atmosphere of carbon dioxide, the products retaining their freshness indefinitely.

Heathization, the new science in keeping air out of food, is merely getting back to Nature—imitating Nature's process as nearly as modern science and invention will permit.

Heathization is now used by hundreds of food manufacturers. They represent a combined capital of over \$100,000,000. The foods involved are ice cream, butter, bread and candy products, for which the American public spends billions of dollars annually. In the ice cream industry, manufacturers in all parts of America are Heath enthusiasts. As it is only possible to use the very best materials in the making of Heathized Ice Cream, manufacturers welcome the Heath process because it certifies to the purity of their product.

SOCIAL FEATURES

The Social Features will consist of the following:

Auto Ride for Ladies to Home of Chas. M. Schwab, Loretta, Pa.
Theatre Party to Musical Comedy, Ladies as Guests of Ass'n.
of Ice Cream Manufacturers of Pennsylvania.

Matinee, Theatre Party for Ladies, Guests of Central Pennsyl-
vania Ice Cream Manufacturers.

Banquet—Dance with Noted Singers, Vaudeville Acts and Other
Entertainment.

LITTLE ROCK EXPECTS EVERY DIXIE MANUFACTURER TO BE ITS GUEST DECEMBER 4, 5 AND 6.

RECORD ICE CREAM BRICK AT NATIONAL CONVENTION.

The largest ice cream brick ever made was displayed at the "dance diable" at the Masonic Temple the fourth evening of the convention. It was approximately six feet long, three feet wide and three feet high. There were three layers—chocolate, vanilla and strawberry. It contained 150 gallons of ice cream, 50 gallons to the layer. The services of six men were used in making the brick, this requiring 10 days. It was hardened in a room 18 degrees below zero. The gigantic brick weighed 675 pounds. It was large enough to serve 5,000 people.

GOLF MATCH TO OPEN PACIFIC CONVENTION.

Delegates to the annual convention of the Pacific Ice Cream Manufacturers' Association will enjoy the novelty of seeing an ice cream convention opened with a golf match. The eighth annual Pacific convention will be held at Vancouver, British Columbia, December 3, 4 and 5. To make it interesting the association is offering a cup for the delegate who turns in the best golf stroke.

Evidence of the interest being felt in the Pacific Northwest over the coming convention is given by the fact that the officers did not have to change their tentative program, every man scheduled to speak having accepted the invitation.

Bert H. Walker, Tacoma, Wash., secretary of the association, invites Eastern friends to attend the convention. Hotel Van Couver will be convention headquarters. The secretary advises all contemplating attending the convention to make early reservations. He promises that all visitors will be royally entertained.

Canadian members of the association are deeply gratified over the visit of their association, and will make every effort to make the visit interesting and entertaining, we are told.

MICHIGAN SHOW SET FOR FEBRUARY 5, 6, 7.

Kalamazoo again has been selected for the annual convention of the Michigan Allied Dairy Association and the show by the Michigan dairy Boosters.

This announcement concerning convention plans comes from R. F. Frary, secretary of the Michigan Allied Dairy Association. C. J. Yunker, president of the Michigan Dairy Boosters, advises The Review that his organization is making extensive plans for the best exposition ever held in the Michigan dairy industry. The dates selected are February 5, 6 and 7, 1924.

Those who attended the convention-exposition at Kalamazoo last year understand the importance of this event, and there is no doubt that the affair this year will be largely attended.

NEW YORK STATE MANUFACTURERS MEET IN DECEMBER.

The sixteenth annual convention of The Association of Ice Cream Manufacturers of New York State will be held at Rochester, December 5 and 6, it was announced late last month by President Vernon F. Hovey and Secretary A. M. Le Messurier. They promise important discussions. The Rochester committee now is making arrangements "to make this convention a complete success," it is announced.

Anyone who studies the advertisements in this paper does not have to be told that it is a profitable habit. He collects the profits daily.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

KANSAS PREPARING FOR CONVENTION.

Preparations are going forward for the eighth annual convention of the Kansas Association of Ice Cream Manufacturers, according to officers of that association. The convention, as announced in the preceding issue, is to be held at Wichita, January 22, 23 and 24, 1924.

Officers say they are striving to uphold Kansas' reputation for making its annual convention one of the best of any state association in the industry.

"We are arranging a program full of interest for every ice cream manufacturer, and we assure you that the time will not drag while you are in Wichita," says Secretary B. T. Perkins, in a recent bulletin. You will remember that three years ago Wichita gave us the best entertainment we had been given and you may expect better in 1924.

"It is expected that those that insisted on a three-day session will come forward with suggestions as to program. If any member has a subject he wants discussed or some special speaker would like to have we will be glad to have any such suggestions. We will try to have something new as well as entertaining and instructive."

"Kansas has the reputation of the best annual convention and we are intent on retaining it. You can always rest assured we will set a new standard. Now, fellows, it is up to you to help do this as you will realize it requires the united effort of all members."

NEW ENGLAND ASSOCIATION MEETS JANUARY 16, 17, 1924.

Officials of the New England Association of Ice Cream Manufacturers have decided upon January 16 and 17, 1924, the dates for their annual convention, the secretary recently announced. The convention will be held at the Copley-Plaza Hotel, Boston.

PENNSYLVANIA PLANT BUILDS ADDITIONS.

Additions and improvements to the plant of the Fries Ice Cream Co., Reading, Pa., 136-144 Maple Street, which started on October 8, will be completed about March 1, next, entailing an expenditure of upwards of \$23,000.

The company is erecting a garage of concrete block and brick, 24x110 feet, with frontage of 137 South Tent street and connecting with the rear of the the Maple street plant. It is designed to accommodate the 20 motor trucks used in the firm's business.

The garage will be completed about December 1, at which time the contractor at once will start to construct a 20x60 foot brick and concrete addition to the freezing room of the plant. This will be erected to the north of the plant and will house a new ice manufacturing unit with a capacity sufficient to produce all the ice used by the company in the manufacture of ice cream.

Heretofore its ice making plant was inadequate to provide sufficient ice, and some of the frozen products had to be purchased. A new and modern refrigerating system will be installed in the ice cream manufacturing department.

The work is being pushed as rapidly as possible to insure its completion by March 1, to make certain that the new facilities will be in readiness for the heavy spring and summer business.

J. M. Fries is president of the Fries Ice Cream Co. Clayton M. Fries is general manager and E. A. Fries is treasurer.

PACIFIC ASSOCIATION PROMOTES DEALER CO-OPERATION.

The Pacific Ice Cream Manufacturers' Association which includes in its membership most of the progressive manufacturers of Washington, Oregon, Idaho, Montana and British Columbia, is an organization that recognizes that the all-important link between the manufacturer and the consuming public is the retail dealer, and is not ashamed to admit it. As an association, its members are eager to foster the friendly community of interest between the manufacturers and the dealers which is so essential to the welfare of both.

An attractive booklet containing the "Declaration of Principles" which was adopted at the 1922 convention of the association as well as many valuable dealer-suggestions has been prepared by President W. V. S. Robb, Seattle, and Secretary Bert Walker, Tacoma. This booklet is sold to and distributed by members of the association to their dealers.

Among the valuable dealer suggestions and selling points offered are:

"You cannot successfully sell a product on which you yourself are not 'sold.'" Acquaint yourself with the many valuable properties of ice cream so that you can expound them to the best advantage to your customers.

"Devote to its handling and sale the same careful attention that you give to any other important part of your business."

"Take advantage of the advertising material furnished by the manufacturer to aid you in building business, and see that it is attractively displayed to get the maximum results."

"See that your ice cream is kept in good condition at all times, and that it is neatly and attractively served."

"In the preparation of sundaes, sodas, etc., use the best syrups and syrups obtainable, and see that they are carefully compounded according to the best formulas."

"See that all containers, dishes, spoons, etc., in which ice cream is handled and served are kept clean and in good condition."

"Assist the manufacturer by promptly cleaning and returning empty cans and packers. Carelessness in this respect results in a heavy item of expense which must be added to the manufacturer's cost, and consequently to the price paid by the consumer."

"Remember that the manufacturer who serves you is anxious to assist you in every possible way, and do not hesitate to call upon him for help or suggestions. In this regard contact with a great number of dealers, he may have gained just the knowledge or ideas which are needed to make your ice cream sales the highly profitable part of your business which they should be."

CONVENTION PROGRAMS ANNOUNCED.

The association secretary who is puzzling himself over suitable subjects for his convention program will do well to go through this issue and take some points from the subjects handled at the national convention last month, and also to study the programs of other associations announced in this issue.

The Texas, Pennsylvania and Pacific associations announce programs more or less incomplete, all notable for their vital subjects listed.

The Southern association announces a very striking preliminary program.

A subject to be discussed by the Illinois association, whose program was not complete at this writing, is sure to be heard with great interest. It is, "What Constitutes Quality in Ice Cream?" It is a point to be earnestly considered. We hear much of quality and many of us have many different ideas on the subject.

Every manufacturer believes he makes quality ice cream. But how many can say offhand just what is necessary to quality—just what the word actually means? It is a point that should be given careful thought.

Claims use since October, 1920.

ILLINOIS ASSOCIATION MEETS IN DECEMBER.

Illinois manufacturers will meet at Hotel Sherman, Chicago, December 11 and 12, for their twenty-fourth annual convention, it was announced recently by officials of the Illinois Association of Ice Cream Manufacturers.

This association, the pioneer in the ice cream industry, has a long record of successful conventions. The meeting next month is sure to be largely attended, officials believe.

Secretary N. Loewenstein has announced the following subjects as a partial list of those to appear on the program: "Refrigerated Cabinets," "Service Charges," "Truck Delivery," "Electric Trucks," "Some Trade Abuses," "Edible Gelatine," "What Constitutes Quality in Ice Cream."

The secretary invites members to send in suggestions for subjects in completing the program.

"IT'S A GIRL."

A. E. Parks, Columbus, O., representing Sturges was called home the first day of the Cleveland exposition to attend the arrival of a baby girl. Parks travels Ohio, West Virginia and a part of Pennsylvania.

Mighty Outpouring of American Ice Cream Manufactures

(Continued from page 40)

A scheme had been in vogue charging so much a pail for ice. One of the large companies was making their own ice and forgetting to charge for it," Mr. Dunne said. "The result was war; a needless price cutting war with its resultant loss to every one involved.

"Something had to be done. The writer felt that a service charge should be established and talked with his associates about it. About this time the other fellows, as well as ourselves, were so heavily in the red, that we all felt the necessity of a conference. At this conference my weekly service charge was broached.

"It did not meet with instant pleasure and many plans and counter plans were considered before we finally adopted a service charge of \$1.00 per week, collected in advance by some, and at the end of the week by others.

"At first there was considerable misunderstanding, since we had unfortunately called it an icing charge, and many customers considered this a fine opportunity to discharge their ice men, and proceed to ice up their store for all purposes, one Greek merchant taking five ten gallon tubs of ice off the truck one day, with which to ice up his water melons.

"This was about the limit, so we all agreed to work and find a solution of this new trouble, and again more conferences.

"We wanted to get the merchant to understand that the ice belonged to us, that it cost money, time to renew the supply, and delay among the rigs, so that customers at the farther end of the route were entirely without ice and had soft ice cream, while the rigs were away replenishing the supply, or waiting for a new supply to be brought to them.

"Sometimes a threat to reverse the route so that the

ice taking customer himself would be the last one have its effect. We still have our trouble along this line but we will ultimately reduce this practice to a minimum.

"We now call it a service charge, because service is the correct name; and why not? Does any other business in the world do all the advertising, send its men daily to a store, assume the responsibility of keeping the stock a man sells in perfect condition, replenish the same daily, give him additional service should necessity demand, and assure him of a turnover, that is second to none in his store?"

N. J. Dessert, Detroit Creamery Co., spoke on the "Spread in Cost Between Brick and Bulk Ice Cream."

"The cost of labor in manufacturing bricks is .040 per gallon," said Mr. Dessert. "The cost of supplies is .0521. Difference in delivery is .1789. Shrinkage .31. Total difference .3030.

"The difference in cost of **delivery** of bulk and brick ice cream is estimated on the basis that it takes as much ice and salt, space and time to deliver three gallons of brick as five gallons of bulk cream.

"You gentlemen are all familiar with what constitutes **labor costs** on brick cream, but anyway I will mention that our charges include operating Mojonnier brick machines, lining cartons with parchment, filling slabs by hand, cutting hand-filled slabs into pints and quarts, wrapping hand-made bricks, also cutting brick individually for push carts.

"The item of **supplies** includes cartons, wrapper rubber bands, cardboard circles and miscellaneous supplies used in operation.

"I mentioned 'shrinkage' costing us three cents a gallon. This is the item I wish to call particular attention to. You have all heard the old adage that 'small

THE ICE CREAM REVIEW COVERS AMERICA LIKE THE DEW.

leaks will sink a great ship.' Now in this case the small leak did not sink a great ship because we plugged it up in time. But just the same that small leak cost us over \$900.00 in the month of July alone. In other words, we lost something over three cents a gallon on 32,000 gallons of brick ice cream. Here is how it happened:

"We have been using cartons which were made to take hand-made bricks. You must make some allowance for the irregularity of cutting hand-made bricks. The cartons must be a trifle large because sometimes the bricks are not sliced perfectly straight. I don't want to bore you gentlemen with figures but when this matter of over-run or shrinkage was brought to my attention, I determined to dig right down to the bottom of the case and see what was wrong. And here it is in figures:

"The standard quart carton contains 57.75 cubic inches of space. The carton we were using measured $3\frac{1}{2} \times 2\frac{11}{16} \times 6\frac{9}{16}$ inches or 61.73 cubic inches.

This difference, practically four cubic inches on a quart carton, is what caused that shrinkage—it made our brick ice cream cost more than three cents a gallon above what it would have cost had we thought of it in time that the old carton for hand-cut brick was larger than it should be for a Mojonnier filled brick. Now we are having cartons made which measure $3\frac{1}{2} \times 2\frac{3}{4} \times 6$ or 58.09 cubic inches. This is just a trifle larger than the standard carton (57.75 cubic inches) but we are making allowance for the parchment lining."

The association's executive session was held October 25. At this meeting officers were elected as follows:

President, V. F. Hovey, Schenectady, N. Y.; vice president, William W. Campbell, Shreveport, La.; treasurer, A. J. Weller, N. Loewenstein, Chicago, was elected secretary. New Orleans was selected as the next convention city, winning over Los Angeles, Calif., St. Louis and Kansas City.

Why Business Man Should Attend All Meetings of his Trade Association

By W. W. CAMPBELL*

THERE are many reasons "Why the business man should attend all meetings of his association." I shall only attempt to give you a few reasons as I see them:

This association was formed some twenty odd years ago, with the following objects for its platform: 1. To promote and safeguard the common business interest of its members; 2. To establish and maintain friendly relations among those engaged in the manufacture of

W. W. CAMPBELL.

ice cream; 3. To take united action upon all matters affecting the trade at large. How well the association has lived up to and carried out these principles, the enormous growth of the industry of the ice cream

There is no person in any line of industry that fulfills his obligations to the public at large who does not attend the meetings of his trade association. Meeting men in your own line of business puts you directly in touch with your competitor. The friction in your mind against that of a competitor

sharpens your conceptions of what you are doing as against his way of doing it. The friction between two minds having the same inspirations, but possibly working from different angles, naturally sharpens both minds, so that while your competitor may gain something from you, you are bound to get something from him. This does not mean following his line of constructive thought or copying his methods, but is a mental cock-tail. There is a natural stimulant when many minds having the same basic thought are brought together. The psychology of this is apparent whether one is a believer in the trans-

ference of thought or not. The will to do this or that being in numerous minds is brought to affect all minds present and adds force to the thought, for this reason the progressive manufacturers of ice cream throughout the United States and Canada come together annually to discuss new methods, economic conditions, and the best possible means of improving our industry.

For purely business reasons it is well to mingle with men of one's own business. The time for concealment of methods in business is past. A free interchange of ways of bettering things or improving products, is the motive that moves men's minds in trade meeting. The progressive manufacturer of to-day who has worked out some problems for the betterment of the industry is different from what it was some years ago. He is glad and willing today to give to those in the industry the benefit of his knowledge which will help to promote and elevate the ice cream business. It is through the co-operation of the ice cream manufacturers, one with the other, and the supply men that we have been able to make the advancement in the ice cream industry that we have made in the past several years. It is through the trade association that we have put ice cream no longer as a luxury, but as one of the most essentials of foods. Science and necessity have taught us many things about food, so many things we once thought as indispensable as food we have since found wholly unnecessary, others we thought of only as luxuries we have found are food necessities. Ice cream has been found to be an essential food. Science and actual experience both in the home and hospitals have proven it to be necessary and nourishing food. These things have all been made possible by our trade association.

When a competitor shows a greater advance in business than you, don't say that he has used underhanded methods or that he hasn't played the game fair, possibly he has done deeper and better thinking than you. Meeting him at trade conferences may reveal his methods, whether intentionally or not, at the same time it supplies a tonic to your mind.

Concealment of your business methods or ways of bettering the trade reveals the fear that you are not as strong as others in your trade.

Loyalty to your organization should spur you to attend your trade meetings, take part in their deliberations, and I am sure that you will derive a great benefit

* Address before National Convention.

Standardize on a Safe Gelatine

To safeguard the reputation of your product you must be sure of the quality of your ingredients. You must please the public! You do this best and easiest by standardizing on materials that are of unvarying good quality.

Save yourself concern—uncertainty—in the matter of the gelatine you use by standardizing on “Atlantic”—a gelatine so pure, so clear and of such uniformly fine quality that it is described as a “super-clarified” gelatine.

Painstaking care in manufacturing, using only the finest raw materials obtainable, is what accounts for the consistent high quality of our gelatine. Atlantic passes the pure food requirements of every state in the Union. It's dependable!

Tie to Atlantic super-clarified Gelatine—and play safe.

YOUR CO-OPERATION WITH OUR ADVERTISERS BRINGS DESIRED RESULTS.

No manufacturer can say that he can not spare the time or can not stand the expense of attending these trade meetings and be content to let the more progressive men carry on the work of the organization. It has been my experience that a man generally gets out of an organization what he puts into it. If he puts nothing in he certainly cannot expect to get anything out. Your organization is a basic institution, and all who belong to it must derive a benefit from whatever concerted action results. There is no other way of which a full concert of action can be had.

The annual meeting of the ice cream manufacturers, together with the supplymen, is looked forward to by the majority of those engaged in the industry as one of the greatest and most educational events in the year's work. It is to some of us our vacation. While we are busy and have our industry in mind at all times, yet the pleasure of meeting not only those who deal directly in the manufacture of ice cream, but it brings us in closer touch with those from whom we purchase our supplies and equipment. It is at these annual meetings that we see displayed every piece of machinery used in the ice cream plant, we not only see it and have it explained to us, but in a great many instances we see the machine in actual operation.

In this progressive age every line of industry and profession has its organization and societies, the doctor, the lawyer, the dentist, the wholesale merchant, the retail merchant, the manufacturer, all hold their annual meetings. They do not hold these meetings for the purpose of regulating prices, but to discuss the best methods, what is best for the industry in their particular line, and for the best way of serving the public.

Trade organizations are necessary in any line of in-

dustry. It is through these associations that the public is protected from unscrupulous methods in the manufacture of food products and advertising that is misleading to the consumer.

Having attended these trade meetings for the past several years I cannot possibly see or conceive of any reason why the progressive business man should not attend the meetings of his trade association.

MICHIGAN ALLIED DAIRY ASS'N

Dairy Booster Officers:

Pres., C. J. YUNKER
1112 Radcliffe Drive,
Toledo, Ohio.

Secy., C. J. W. SMITH
c/o Creamery Package
Mfg. Co., Detroit.

PLANS FOR MICHIGAN DAIRY SHOW.

All arrangements are being made readily for the next Michigan Allied Dairy Show to be held in February at Kalamazoo, Mich. So get ready to attend it.

The Cleveland convention was a great success and sales were good.

Michigan Dairy Boosters' officials are now planning for great exhibits and other entertainments. They also wish to call the attention of their members to pick the spaces just as soon as floor plans are issued and make them out. So do not delay any for so many are now asking about it.

Look out for the next great dairy convention to be held at Kalamazoo in February. It will be larger and better than ever. The floor plans will have 94 booths.

Michigan Dairy Boosters will entertain those who attend the Michigan Allied Dairy Association show. They will make you all wake up and take notice. They are known for being great entertainers. Those who attended last February will vouch for that.

Now, everybody, get ready and make arrangements to attend it.

C. J. YUNKER, Pres.

Cleveland, Ohio

THE TELLING-BELLE VERNON CO.

CLEVELAND, O.

EXECUTIVE OFFICES

September 23rd, 1922.

C. E. Rogers & Sons,
Detroit, Mich.

Gentlemen:

We take pleasure in saying that the Rogers condensing pan installed in our new Wellington plant is a great improvement over the pans heretofore used. We find that we can boil at a lower temperature with water at a higher temperature, and with less entrainment loss than has been our experience with other pans. The pan also has a decidedly greater capacity. We are very glad in this way to express our satisfaction with this installation.

Yours very truly,

THE TELLING-BELLE VERNON COMPANY.

J. H. Knudsen
Vice President.

1,000. Ranging from the Tulsa, with 380 rooms, and the Ketchum with 130 rooms, down to the smaller one, Tulsa's hotel accommodations are unsurpassed anywhere in the Southwest.

Theaters.

Tulsa has the finest motion picture theaters in the state with the largest professional orchestras between Kansas City and Denver. In fact, the music in Tulsa

Tulsa Has Some Skyscrapers.

theaters has become the outstanding feature of the city's playhouses. The Majestic Theater has one of the most thoroughly equipped pipe organs in the country. With its seventeen sets of pipes, while many good organs have only five, there is scarcely a limit to the combinations that can be worked out upon it.

Hard Surfaced Road System.

Tulsa is the center of a hard surfaced road system that reaches every post office in the county. One hundred miles of concrete highway have been constructed and are now connected up with other systems of adjoining counties, making wonderful drives through the rich Arkansas river valley to the foothills of the Osage. Numerous bus lines, handling both freight and passengers, maintain regular schedule.

Railroad Facilities.

Tulsa has excellent railroad facilities. The city is served by the Frisco main line from St. Louis and the Santa Fe from Kansas City, Chicago and eastern points. The M. K. & T. runs from Muskogee to Osage and gives Tulsa the same service from St. Louis and eastern points as the Frisco. The Midland Valley Railway runs from Wichita to Ft. Smith and gives to Tulsa direct service from Colorado and the west and Memphis and the eastern territory. The two interurban electric lines do a large volume of freight traffic as well as heavy passenger traffic. The convenience of such transportation has brought about marked increase in the business of Tulsa merchants.

PLEASE MENTION THE ICE CREAM REVIEW WHEN WRITING TO ADVERTISERS.

Churches and Schools.

Tulsa is not only a city of big business but it is also a city of beautiful and commodious church building. Catholics, Protestants, Hebrews and Christian Scientists, are all well represented in Tulsa and housed in splendid church structures.

The public school system is known throughout the United States as one of the most complete, standardized systems in operation. The high school, which is the largest west of the Mississippi and third largest in the United States, is four stories in height, covers an entire city block, and has 175 thoroughly equipped rooms.

TEXANS GATHERING FOR STIRRING CONVENTION.

(Continued from page 10)

the United States. There are many grafts which have been developed locally and it is commonly claimed by horticulturists that as many as twenty-six different varieties abound there.

The effect of the coloring of the houses, running from ordinary to quaint buffs and reds, coupled with the purplish green of the lawns and the blooms to be found at all seasons in almost every dooryard, form a combination of entrancing beauty such as one will hardly find outside the tropics, and with the added advantage that it does not have the abominations that usually exist in such tropical centers.

Galveston is one of the oldest cities in Texas, having been established as early as 1818 and has always been considered a principal outlet by water for all the Southwestern territory. It has not grown as rapidly as some of the interior cities with their advantage of enormous rich agricultural lands around them and the increasing use and efficiency of the rail lines, but it has grown to be one of the first three ports in the United States, the leading cotton port of the world, and it also handles enormous quantities of grain, sulphur, oil, cotton seed products, spelter and many other commodities. Ship foregather here from every corner of the globe, flying nearly every flag and carrying every kind of commodity from peanuts to pianos to their various home ports. It is distinctly worth while for a person not familiar with ships and shipping, to spend a half or a full day, if possible, on the water front studying the methods used in carrying on the world's commerce. As a matter of fact, the water front is almost as popular with the tourists who visit Galveston as is the beach front and very few of them come here without at some time paying a visit to the largest steamers.

The details of the program of the ice cream manufacturers' convention have not been worked out thoroughly, but the two local companies are working on them already and promise that very soon a public announcement will be made. However, they break the bonds of secrecy enough to say that the entertainment provided will be very lavish and that every person who attends the convention will not have an idle moment to spend and will thoroughly enjoy himself during his entire stay.

This clearly emphasized the advantages of organization, officers of the Arkansas association point out. Success in this fight would have been impossible, they assert, if the different industries affected had not been so closely organized.

You can find the person who will be glad to buy what you wish to sell, by letting your desires be known through an advertisement in The Ice Cream Review.

PACIFIC CONVENTION NEAR.

Preparations for the Pacific Ice Cream Manufacturers' annual convention at Vancouver, B. C., December 3, 4 and 5 are rapidly moving forward, according to announcement by Secretary Bert H. Walker, Tacoma.

The following statement regarding the convention sent The Ice Cream Review by Mr. Walker last last month:

"We are going to hold the convention in Vancouver, B. C., which is much the same that it will be A D to old days and some of the conditions that prevailed in the good old U. S. A. prior to the advent of that highly praised and roundly condemned statesman, will have effect during the meeting.

"Anyone who has attended a Pacific Association convention will tell you it is an event to be remembered. Ask H. P. Olsen if you need anyone to substantiate my statement, we had the pleasure of having him with us one year, and on the night he was leaving, after saying good-bye to the bevy of ladies he was surrounded by he said; Bert this is the best convention I have ever attended.

"We can assure anyone who is interested in ice cream, that if he happened to be in this section at that time, one day, our British Columbia friends are royal hosts. A wire from Bert Hoy states the price of permits will not be raised during our stay.

"Special notice to golf addicts: Bring your clubs and you and compete for the Pacific Cup, George York Vyandotte fame will handle the event which is to be played on the course of the Vancouver Golf and Country Club on Sunday, Dec. 2. Some of you easterners who think you play the game, just come out and see a few stars like George Burt or Joe Dunne, some of these players have to take their pills with them; they just drive from the tee in Portland and their families gather up the balls on the Vancouver grounds, don't believe it? Then come out and see for yourselves.

"We will be pleased to welcome any ice cream manufacturer or supplyman who is in the territory, Dec. 2."

MINNESOTA PLANT PURCHASED.

W. Hamlin of Madison, Wis., has purchased the machinery and equipment of the Guernsey Ice Cream Co., Rochester, Minn. According to report, Mr. Hamlin plans to start up this business again, and he plans to build a model modern ice cream factory in the spring of next year. The Guernsey company has not been operating for some time, but Mr. Hamlin will use the present equipment in operating the new business in the meantime until he can move into his own factory.

CALIFORNIANS MEET IN JANUARY.

At a special meeting of the directors of the California and Southwestern States Ice Cream Manufacturers' Association, it was decided to hold the eighth annual convention at Los Angeles, January 11 and 12,

committees and subjects to be discussed will be announced later. In the meantime the secretary has asked members to set aside these two dates and make arrangements to attend.

The announcement was made last month by C. J. Woods, President.

Reduce Bacteria Count

Buy one of these cells—

Put salt water in it.
Turn on current of electricity.
Product is Sodium Hypochlorite.
Cost about 2 cents per gallon.
Keeps down stale milk odors.
Reduces bacteria count.
Bacteria count is the index of quality.
High quality increases business.

Following is a City Bacteriologist's report on a big ice cream plant using this Hypochlorite freely:

	Bacteria per C. C.
Mix No. 3 Chocolate	3,000
Mix No. 4	1,000
Vanilla Ice Cream	2,000
Peach Ice Cream	1,000
Strawberry Ice Cream	2,000
Chocolate Ice Cream	4,000
Harlequin Ice Cream	2,000
"Milco"	1,800

Bacteria count for Ice Cream usually runs into the hundreds of thousands per C. C. **Why Not Reduce It?**

Advisability of a Weekly Service Charge

By J. E. Dunne*

THE service charge in the ice cream business is more necessary even than an insurance policy to protect against fire.

Undoubtedly many of the factors that have caused the ice cream firms in our city to decide on a service charge are the same problems that you have in your daily management, hence a preamble is scarcely necessary and a recitation of actual practice due to years of experience is of vastly more import to you.

In 1912 one of the "wars" was on in our community. A scheme had been in vogue charging so much a pail for ice. One of the large companies was making their own ice and forgetting to charge for it. The result was "war;" a needless price cutting war with its resultant loss to everyone involved.

Something had to be done. The writer felt that a service charge should be established and talked with his associates about it.

About this time the other fellows, as well as ourselves, were so heavily in the red, that we all felt the necessity of a conference. At this conference my weekly service charge was broached.

It did not meet with instant pleasure and many plans and counter plans were considered before we finally adopted a service charge of \$1.00 per week, collected in advance by some, and at the end of the week by others.

At first there was considerable misunderstanding, since we had unfortunately called it an icing charge,

* Hazelwood Ice Cream Co., Portland, Ore. Address before 23rd annual convention, National Association of Ice Cream Manufacturers, Cleveland, O., October 24, 1923.
